

## Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

## Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

- + *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.
- + *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.
- + *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.
- + *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

## Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página <http://books.google.com>

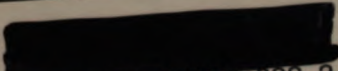

---

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

# ELECTRICAL ENGINEERING

With which is incorporated

THE ELECTRICAL ENGINEER

(Established 1884)

---

VOL. X.

JANUARY TO DECEMBER, 1914

---

PUBLISHED BY THE KILOWATT PUBLISHING CO., LTD., 203-206, TEMPLE CHAMBERS,  
TEMPLE AVENUE, LONDON, E.C.

# INDEX TO "ELECTRICAL ENGINEERING"

VOL. X. 1914.

	PAGE		PAGE
GENERAL INDEX .....	iii	QUESTIONS AND ANSWERS BY PRACTICAL MEN (Including Answers to Correspondents) .....	vii
ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES .....	v	PATENT RECORD .....	viii
REVIEWS .....	vi	LOCAL NOTES (including "Tenders Invited and Prospective Business," and "Tenders Received and Accepted") .....	ix
ELECTRIC TRACTION .....	vi	COMPANIES' DIVIDENDS, REPORTS, MEETINGS, ETC. ....	x
TELEPHONY AND TELEGRAPHY (Including Wireless) .....	vii	NEW COMPANIES .....	xi

## GENERAL INDEX

- Accidents (including Supply Interruptions, Explosions, &c.)—See also under Factories and Workshops, and Mining Index.—(Mains Explosions, Departmental Committee's Report), 395; (Birmingham), 28; (Dundee), 28; (Eastbourne), 14, 28, 84; (Fire at Spiers and Ponds), 417; (Flywheel), 16; (L.C.C. Trams), 17, 589, 639, 651; (Ontario), 100; (Poplar), 599; (Shocks), 184, 438, 451, 589
- Advertising Dispute, 262
- Advertising Novelties, 94, 262
- Agriculture: [DRYSDALE], 6; [PRIESTLEY and KNIGHT], 102
- Air Filtration [GURRY], 7
- Air-gaps of Elec. Motors, 458
- Alternator Regulators, 643
- Aluminium, 412, 606
- Aluminium Feeder, 237
- Aluminium Lightning Arrester, 394
- American Elec. Eng. Handbook, 412
- Arc Lamp Lowering Gear, 285
- Arc Lamps: Globes [BAYNES], 507; (Carrier for), 653; (Long Burning), 44
- Armorduct Co., 555, 610
- Assoc. of Consulting Engineers, 93, 384, 617
- Assoc. of Engineers-in-Charge, 177
- Assoc. of Supervising Electricians, 176, 267, 546, 606, 608, 617, 649
- Australian Trade, 507, 652
- Aviation, Electricity and, 329
- Bakery (B.T.-H.), 196
- Balcke Exhaust Steam Accumulator, 368
- Barges, Electric, 302
- Battery Lamps: (B.T.-H.), 107; (G.E.C.), 53; (Siemens), 53
- Batti-Wallahs, 127, 269, 384
- Battleship, Elec. Equipment of [HORNOR], 585
- B.E.A.M.A.: 46, 457, 520, 613; (And the War), 465, 514, 531; (Chairman), 391; (Dinner), 61, 560; (Exhibition), 304; (General Conditions), 165, 250, 304, 405; (H.O. Regs.), 217; (Report), 61
- Belfast, 527
- Belgian Engineers, 583
- Belgian Relief Fund, 467
- Belgian Trade, 531, 646
- Bell. Elec. Operated, 312
- Belliss & Morcom (Birmingham Wks.), 325
- Birmingham: (Manufactures), 489; (Summer Lane Station), 320
- Bolton Power Station, 502
- Boosters, 239
- Bradford: (Turbine Contract, 54, 58, 490, 568
- Brewery Installation, 240
- Brimsdown Lamp Wks. Law Suit, 462
- British Association, 462, 471, 473
- British Elec. Industry, 'Position of [Scholey] 660
- British Engineers' Assoc., 489
- British Export Trade, 517
- Buzzer, 297
- Cable Casing: [JENNINGS], 70
- Cables: [BEAVER], 597; (Heating of), 407; (Henley's), 140, 219; (Pirelli-G.E.C.), 72; (Siemens), 273
- Callender's Hospital Fund, 70
- Camp Lighting, 649
- Canadian Exports, 417
- Carbons: (Carbon Supplies and the War), 470; (E.E. & E. Co.), 531; (B.O.T. Return), 560; (G.E.C.), 346, 471; (Herrion Carbons, Ltd.), 484; (Searchlight), 439
- Carbons, Alleged Theft of, 473, 489, 497, 508
- Cascade Motors [HUNT], 157
- Ceiling Roses, Standard, 484
- Celluloid and Incandescent Lamps, 214
- Celluloid, Storing of, 280
- Cement Works, Elec. in, 415
- "Central," The, 44, 429, 598
- Central Suspension Lighting: (London Elec. Firm), 54; (Wardle), 71
- Chemists' Factory, Electricity in, 430
- Chicago Generating Stations, 157
- Child Culture, Electricity and, 328
- Church Lighting, 286
- Cider Mills, Electricity in, 499
- Cinematograph Exhibition, 455
- Cinema Theatres: (The Half-Watt Lamp [Barber]), 480; (Carbons), 287, 470; (Equipment of), 495; (Kamm), 208; (Lighting), 213, 480, 530
- Circuit Breakers, 384, 444, 447, 476
- Clocks, Electric, 296, 312, 370
- Commutator Grinding, 376
- Competitions, 7, 94, 230, 563, 577, 587, 599, 610, 622
- Condenser Protective Gear, 261
- Condenser Tube Corrosion, 526
- Conduits and Fittings: (Grip Fitting Patent Case), 560, 598; (Hemming), 351; (Siemens), 273; (Simplex), 52, 122, 169; (Sun Elec. Co.), 352
- Consulting Engineers: (Etiquette), 292; (Congress), 203; (Liability), 224, 267
- Continental Trading Methods, 560
- Contract Conditions, B.E.A.M.A., 250, 304, 405
- Cooking (see also Heating): (Belling), 170; (B.T.-H.), 376; (Drake & Gorham), 244; G.E.C.), 273; (Simplex), 220; (Townshend), 182, 554
- Copper, Standard Resistance for, 237
- Cottage Lighting [FENNEL], 177
- Cotton Mills [STOKES], 146
- Cumberland Power Co., 61
- Daimler Motor Works, 326
- Daylight Lamps: (B.T.-H.), 136
- Diesel Engines Users' Association, 241, 653
- Diesel Engines (Macclesfield), 248, 293
- Disinfecting Fluid, 419
- Drury Lane Pantomime, 17
- Dust Clouds, Electrification by, 368
- Dynamo & Motor Industry, Effect of War on, 493
- Edison's Works, Fire at, 644
- Ediswan: (Works), 208, 261, 475, 515; (Heaters), 530; (Showrooms), 449
- Education, 21, 48
- Electrical Engineers' Ball, 14
- Electrical Proving House, 416
- Electrical Trade Benevolent Inst., 30, 102, 115, 158, 250, 457; (Dinner), 188
- Elec. Trades Union, 224
- Elec. Contractors' Assoc., 259
- Empire Trade, Organisation of [HIRST], 266
- Enamel Sprayers, 274
- Engineering Standards Committee, 406, 484
- "Equiluxo" Ash Tray, 612
- Exhaust Steam Accumulator, 368
- Exhibitions: Bradford, 348, 500; Cinematograph, 455; Holland, 308; Internat. Rubber, 103; Lowestoft, 124; Shipping, Engng. and Machinery, 104, 204, 473; South Met. Co., 149
- Factories and Workshops: (Chief Inspector's Report), 407; (Home Office Prosecutions), 237, 500; (Regulations), 100, 217
- Fans and Blowers: (G.E.C.), 403; (Simplex), 95, 389
- Faraday House, 232, 349, 553
- Feeder Pressure Regulators (B.T.-H.), 205
- Ferranti-Waters Protective Gear, 369
- Ferranti Watt-hour Meter, 293
- Field Regulators (G.E.C.), 604
- Finsbury Technical College O.S.A., 156
- Fire at Spiers & Pond's, 417
- Fire-escapes in Berlin, 430
- Fire Extinguisher, "Pyrene," 287
- Fittings: (B.T.-H.), 261, 272, 298, 489; (Ediswan), 138; (G.E.C.), 25, 625; (Simplex), 538, 581; (Townshend), 521
- Flex, "Thermoid," 547
- Flex [MELSON & BOOTH], 632
- Floor Machine, Rotary, 297
- French Red Cross Society, 568
- Frequency Transformers, 226, 268
- Fullarton Vibrometer, 663
- Fuses: (Electric Control), 565; (Fluvent), 634; (Kartret), 229; (Lundberg), 230
- Galvanometer, A New, 237
- Gas v. Electricity, 36
- General Electric Co.: (Brewery Installation), 240; (Carbon Works), 387; (Dinner), 158; (Fittings Works), 325; (Glassworks), 498; (Osram Lamp Works), 507, 512; (Press Visit), 346; (Witton Works), 322

GENERAL INDEX (*continued*).

- Generation and Transmission, Problems of [HUNTER], 596  
 Generators, Equalising Connections on, 462  
 German Elec. Industry, 632  
 German Industrial Difficulties, 609  
 Germany's Export Trade, 454, 465, 470, 499, 517, 519, 542, 554, 555, 561, 589, 659, 662 (see also "War")  
 Glasgow Power Station, 380  
 Glassware, British, 499  
 Golf by Electric Light, 201  
 Gottschalk, J., 567  
 Granite Quarry, Elec. in, 268  
 Greenock Elec. Soc., 525  
 Griller (Venner), 244  
 Grinders : (Butler), 26; (Morris & Lister), 633  
 Hackney, Three-phase Supply, 616  
 Half-watt Lamps, 8, 31, 72, 417; (A.E.G.), 108, 122, 267, 293; (Bristol Exhibition), 261; (B.T.-H.), 38, 412, 505; (Cartoon), 416; (Cinematograph), 480; (Drake & Gorham), 38; (Ediswan), 39; (Electrical Co.), 39; (G.E.C.), 37, 459, 665; (Light-houses), 459; (London Elec. Warehouse), 72; (Low Voltage), 333; (Manchester), 563; (Motor Car), 580; (New Sizes), 422, 436; [OLIVER], 60; (Prospects of), 31, 47, 60; (Siemens), 39, 400, 411; ("Why was England Late?"), 34; ("Z"), 38  
 Half-watt Lamp Fittings : (B.T.-H.), 38, 82, 95, 107, 136, 151, 565, 580; (Benjamin), 220; (Electrical Co.), 39; (G.E.C.), 96, 181; (Siemens), 39, 70, 119, 138, 400; (Wardle), 52, 168  
 Heating (see also "Cooking" and "Irons") : (Alheat), 245; (Bastian), 521; (Belling), 96; (Ediswan), 530, 624; (G.E.C.), 272, 580, 613; (London Elec. Trading Co.), 604; (Marylebone), 245; (Schonfeld), 662; (Simplex), 245, 554; (Submarines), 572  
 Helm Indicator, Luminous, 642  
 Hoardings : (B.T.-H.), 53; (Siemens Bros.), 352  
 Holophane Glassware, 652  
 Hot Weather (Cartoon), 380  
 Hotel Lighting, 262, 274  
 Hull Docks Elec. Equipment, 356  
 Ignition Battery (Braulik), 26  
 Incorporated Municipal Elec. Assoc. (see also Elec. Vehicle Committee under "Traction") : Annual Meeting, 366; Birmingham Conditions of Contract, 165, 250, 304, 405; Convention, 188, 282, 317, 319, 337, 357; Cartoon, 336; Dinner, 346; Preferential Charging, 578 (see also "Preferential Charging"); Replacing German Goods, 581; Wiring Bill, 78, 127  
 Inductive Interference of Parallel Circuits, 598  
 "Installation News," 643  
 Inst. of Civil Engineers, 236, 396, 568, 588  
 Inst. of Elec. Engineers : Annual Meeting, 292; Annual Report, 281; Birmingham Section, 236; Conditions of Contract, 165, 250, 304, 405; Conversazione, 380; Council, 187, 212, 281, 380; Dinner, 88, 224, 236; Faraday Inst., 570; Industrial Committee, 292, 371; Iron Filings Photo, 570; Lecture Theatre Lighting, 598; Leeds Section, 116; Lending Library, 100; Manchester Section, 226; National Service, 445, 472; New Members and Transfers, 30, 61, 128, 165, 202, 304; Presidential Address, 570; 1914-15 Session, 559; Royal Naval Division, 508, 528, 534; Sectional Addresses : (Newcastle), 596; (Scottish), 596; (Manchester), 598; (Birmingham), 617; Scottish Section, 281, 543; Suffragettes, 317; Tothill Estate, 292, 317; Western Section, 537; Yorkshire Section, 308, 589  
 Inst. of Mech. Engineers, 224  
 Insulation, Perfection of, 208  
 International Electrotechnical Commission, 115, 237  
 International Eng'g Congress, 6, 45, 116, 128, 226, 305, 329, 553, 628, 666  
 Interruptions to Supply—See Accidents.  
 Iron and Steel Inst., 214, 236, 280, 293, 484  
 Iron, Magnetic Testing of [NICHOLSON], 656  
 Ironmonger, The Electrical [MILNS], 591, 603  
 Irons, Elec. (Magnet), 298  
 Japan, Elec. Industry in, 440  
 Joinery Works, Elec. in, 168  
 Junction Box Explosion Responsibility, 599  
 Junior Inst. of Engineers, 100  
 Kapp Vibrator (Sandycroft), 214  
 "La Lumière Electrique," 656  
 Lamps, Incandescent (see also "Half-watt" Lamps, Lighting and Metal Filament Lamps) : (Admiralty and Employees), 635; (Canadian Trade), 560; (Carbon Filament Lamp Notes), 152; (Cartons), 53; (Corona), 521; (Ediswan), 515, 538, 643; (Exports), 371; (Flicker of) [LANGMUIR], 175; [HOWELL], 236; (L.C.C. and Foreign), 173; (Mazda), 509; (Osram), 507, 512, 530; (Wotan), 466  
 Lamp Bulb Factory, Lemington, 498; 635  
 Lamp, Hand, "Simplex," 509  
 Lampholder and Reflector, 634  
 Lampholder, Watertight, 633  
 Lampholders, Heating of [PATERSON], 632  
 Lantern Slides : (Berry, Skinner), 153; (G.E.C.), 140  
 Lanterns, Weather-Proof, 652  
 Lawsuits, Pending Elec., 545  
 L.C.C. : (Cable Employees' Wages), 545; (Foreign Lamps), 173  
 Lead-covered Wires in Plaster, 224, 267  
 Lemington Glassworks, 498, 635  
 Lighthouses, Half-watt Lamps in, 459  
 Lighting (see also Lamps, Incandescent and Street Lighting) : (Arcade), 298; (Bandstand), 389; (B.T.-H.), 11, 120, 179, 198, 230; (Business Premises), 623; [CLINTON], 203; (Criterion Restaurant), 230; (G.E.C.), 108, 218, 219, 351; Reduced London Lighting, 502, 536, 582, 629, 637, 663; (Salvation Army Congress Hall), 388; (Sea Front), 332; (Shop), 400, 566, 612, 624, 635; (Weaving Shed), 218  
 Lightning Arresters, 394, 493  
 Lightning Protection [LARMOR], 429  
 Liquidations, 109, 139, 183, 209, 222, 404, 451, 460, 467, 548, 594  
 Liverpool Turbo-Alternator Tests, 647  
 Ljungstrom Turbine Tests, 561, 628  
 Loans : (I.M.E.A. and B.E.A.M.A.), 78; L.C.C., 61, 537, 654  
 London Elec. Eng'rs (Territorials), 533, 609  
 London Elec. Supply, 278, 294, 329, 406, 428, 455, 511, 545, 577, 587, 609, 639, 654, 656  
 Lundbergs' Switching Competition, 94, 230, 563, 577, 587, 599, 610, 622  
 Macclesfield, 248, 293  
 Magnetite Arc Lamps, 220  
 Magnetos : (Supply of), 462; (B.T.-H.), 509  
 Magnets, Lifting, 384  
 Mains Explosions, Committee on, 395  
 Mains Protection, Split Conductor System, 551  
 Manchester Eng'g Societies, 293, 638

## PATENT RECORD

**Arc Lamps:** Ayrton, 134, 178, 350, 446, 519; Brockie and Johnson & Phillips, 134; Bryer Golder & Pearce, 270; B.T.-H., 233, 432; Conradty, 487; Deutsche Gasglühlicht Akt. Ges., 295; Lewis, 456; Railing and Angold, 330; Tate and Monkhouse, 216; Weintraub, 260

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H., 69, 131; B.T.-H. and McCarthy-Jones, 195; B.T.-H. and Wedmore, 590, 661; Clothier and Reyrolle, 602; Crompton and Burge, 192; Cunliffe, 492; Despesaillies, 446; Graham and Ricketts, 41; Heany, 134; Heins, 51; Hemming, 474; Hollister, 456; Lucas, 446; Mirza, 216; Reyrolle, 602; St. Helens Cable Co., 650; Siemens, 41, 233; Siemens-Schuckert, 216; Siemens and Wilson, 41; Smith and Garnett, 192; Torchio and Woodron, 446; Waters, 410

**Dynamos, Motors, and Transformers:** A.E.G., 295, 310; Alexander, 178, 233; Arno, 410; Ateliers de Construction Elect. de Charleroi, 456; Bosch, 350; Brit. Elec. Trans. and Crosbie-Hill, 216; Brown Boveri, 242, 611; B.T.-H., 41, 192, 630; B.T.-H. (G.E. Co., U.S.A.), 270, 386, 536; B.T.-H. and Whitaker, 51, 661; Coates, Mirrey and Reyrolle, 579; Crompton and Burge, 23; Faye-Hansen, 590; Fuller, 456; Heenan & Froude, 590; Heyland, 23; Hunt and Sandycroft, 270; Klinkenberg, 330; Ljungström and Widström, 150; Menzforth (B.W. Co.), 529; Mond, 506; Newton, 206; Olmstead, 552; Phoenix Dynamo and Pohl, 10; Railing and Garrard, 92; Rolfe, 106; Rosenberg, 69; Rübel, 118; Siemens, 178, 233, 242, 284, 474; Siemens Schuckertwerke Ges., 295, 446; Storer, 519; Taylor, 590; Wade, 492; Weiss, 295

**Electrometallurgy and Electrochemistry:** Ansaldo & Co., 86; Benjamin, 80, 195; B.T.-H., 216; Cowper Coles, 397; Grützel, 69; Guggenheim, 257; Hybinette, 195; Johnson, 5; Jones, 195; Krupp, 5, 257; Machalske, 619; Mack, 195; Mies, 192; Strohmenger, 80; Thompson, 51; Tischenko and Plauson, 80; Wallace and Wassmer, 5; White, 166; Yount, Finigan and Brannaman, 195; (Furnaces), B.T.-H., 41, 330; Craig & Spence, 257; Ellis, 310; Eyer mann, 80; Fischer, 216; Helfenstein, 5; Helfenstein Elektro-Ofen., 5; Hiorth, 131

**Ignition:** Biblecombe and Thomas, 151; Mordey, 69; Spada, 260, 602; Unterberg & Helmle, 397

**Incandescent Lamps:** Bastian, 552, 564, 621; Beckwith, 242; Brackensieck, 564; B.T.-H., 41, 118, 506; B.T.-H. (G.E. Co., U.S.A.), 310, 487; Canello, 134; Dobson (Foster Engng. Co.), 546; Estéve, 641; Gladitz, 77, 89, 386; Guisti, 166; Just, 350; Kanazawa, 106; Kruger, 420; Lowden, 118; Mackay, 519; Read, 77; Roux and Sanchez, 106; Siemens, 178; Simpson, 446; Trenzen, 51; Walling, 206; West. se. metallfaden Glühlampen Fabrik Ges., 242; Wolfram Lampen, 23; Zschocke, 41, 69; (Vapour Lamps), Claude, 23; Voigtländer, 284; Wade, 242; Westinghouse Metallfaden Glühlampen Fabrik Ges., 260

**Instruments and Meters:** B.T.-H., 206, 284, 641; Hartmann & Braun, 150; Kolster, 420; Petersen & Kemp, 446; Siemens, 134, 242

**Storage Batteries:** Naylor, 579; Read & Bransan, 564; Scott, 166, 206; Siemens, 92; Soc. Gen. des Nitrures, 270; Stasano, 5; Wardale and Marchant, 80

**Heating and Cooking:** Bastian, 77, 564; Berry, 10, 579, 641; Campbell, 373, 446;

Clarke, 456; Cox, 650; Dalton, 192; Dowsing and Huntley, 10; Downe and Brompton Co., 621; Pate & Wood, 519; Perry and Credenda Conduits, 519; Rippingille, 242; Simplex Conduits, 611; Sprenger, 386; Weaving and Ferranti, 118, 397

**Switchgear, Fuses, and Fittings:** A.E.G., 192; B.T.-H., 350; Baerlocher and Allen West, 51; Berry, 630; Berry and Markham, 611; British Insulated and Blades, 80; Brown, Boveri & Cie., 487; Day, 242; Fincato, 529; Holt & Smith, 552; Jones, 579; Lucas, 242; Lundberg, 242; Martin, 69; Railing, 310; Short, 564; Simplex Conduits, 373; Western Elec. Co., 630; Widegren, 536

**Telephony and Telegraphy:** Arnold, 51; Betulander, 611, 621, 641; Brown, 650; Campbell Blacknoll and Colpitts, 10; Creed, 552; Eastern Telegraph Co. and Jenkins, 350; Ericsson and Dahlström, 474; Freeman, 661; Giles, 650; Graham, 330; Hulfish, 248; Kaehler, 134; Kennedy and Turner, 206, 552; Otto, 602; Pecorini, 92; Pleigel and Olsson, 410; Siemens & Halske Akt. Ges., 270; Squier, 641; Sterry, 106; United Telegraph & Cable Co., 487; Western Electric Co., 260, 373, 386, 464, 579; Williams, 150; (Wireless), A.E.G., 456; B.T.-H., 77; Balsillie, 432; Chambers, 166, 233; Ditcham and Grindell-Matthews, 206; Dwyer, 456; Fessenden, 492; Fleming, 529; Galletti, 474; Lee and Hogan, 192; Leimbach, 310; Marconi, 23, 118, 150, 233, 310, 330, 397, 579, 590, 650; Mellersh Jackson, 270; Miller, 661; Shephard and McKechnie, 51, 69; Signal Ges., 41, 77, 178; Thompson, 420; Torikata, Yokoyama and Kitamura, 106

**Traction:** A.E.G., 446; Cross, 69; Diamond, 546; Hall & Riley, 590; Helfenstein, 118; Lucas, 446; Marks, 242; Siemens, 78; Storer, 650; Wills and Sykes, 590, 621; (Signalling) Boot, 397; Dearle, 410; Heaton, 118; Marks, 260; Siemens, 206; Siemens and Scourfield, 134; Vignier, 51; Westinghouse, 77

**Miscellaneous:** A.E.G., 420; Adams, 10; Aikman, 546; Attwater, 131; B.T.-H., 216, 432, 446; Baker, 602; Beckett & Anderson, 5; Bergmann, 77; Bickford, Smith and Smith, 131; Blenheim, 579; Bowes, Scott & Western and Dalgleish, 131; Brooks & Holt, 611; Caldwell, 69; Cold Light, Ltd., and Hayles, 611; Couch, 641; Darmais and Leblanc, 536; Dean, 552; Faber, 257; Faerber, 80, 257; Faigle, 77; Fithian, 178; Fraser, 77; Gray & Best, 529; Gwynn and Clerk, 92; Hill, 77; Holophane, 536; Joseph, 630; Joyce and Spagnoletti, 619; Klaeden, 5; Kraus, 350; Krüger, 134; Krupp, 195, 257; Leonardt, 546; Lucas and Turner, 621; Macdonald, 257; McClelland, 546; McKinnie, 602; Masch. Humboldt, 5; May, 260; Moore-Licht, 92; Morris & Lister, 564; Nathorst, 5; Newitt & Fletcher, 621; Nicholas, 195; Palmer, 5; Paxton, 257; Philip and Steele, 195; Reineke, 257; Rosenberg, 5; Siemens, 41; Siemens & Halske, 464; Wade, 241; Wall, 270; Webster, 260; Williams, 166, 192; Wolf, 5, 80

Elec. Trans. Co., 536; Joel, 410; Lundell, 386; Phillips, 492

**Electrometallurgy and Electrochemistry:** Baker, 216; Haas, 284

**Ignition:** Hall, 590; Simms and Bosch, 216

**Instruments and Meters:** Duddell, 529; Wright and Reason Mfg., 69, 150, 166, 519

**Switchgear, Fuses, and Fittings:** B.T.-H., 242, 492, 546; De Kando, 446; Ediawan, 81; G.E.C., 489; Kartret, 167; Krupp, 51; Mayes, 330; Partridge, 487; Ward, 611

**Telephony and Telegraphy:** Brown, 233; Brown and Dearlove, 178; Campbell, 492; Chambers, 611; Fleming and Marconi Co., 552, 590; Mansbridge, 564; Marconi, 166, 233; Muirhead, 106; Muirhead and Edgar, 118; Pollak, 233; Pupin, 397

**Traction:** B.T.-H., 564; Brown, 564; Smith, 270; Sykes, Johnson & Cooke, 579; Westinghouse Brake, 106

**Miscellaneous:** Benedicks, 552; Blake & Marscher, 661; Duddell, 611; Fischer, 350; Gronwald, 464; Haddan, 242; Hill, 373; Johnson & Makin, 650; May and Pulsometer Eng'g, 216; Ottaway, 178; Scott, Varley and Anderson, 69; Soc. Elec. Metall. Française, 492; Strecker, 206

## Amendments and Oppositions

**Arc Lamps:** Ayrton, 519; B.T.-H., 150; Blondel, 233; Körting & Mathieson, 23

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H., 69, 373; Hemming, 529; Townson, 410

**Dynamos, Motors, and Transformers:** B.T.-H. and Given, 590; Crompton & Co., 295, 432; Price, 295; Spinelli, 166; Vandervell and Midgley, 23, 41, 51, 178; Zenk, 630

**Electrometallurgy and Electrochemistry:** B.T.-H., 150, 410; Du Bois, 150; Schmidt and Desgraz, 350

**Ignition:** Bartschi, 474; Hopps, 546; Longford and Clark, 192, 233, 242; Spada, 386, 661; Sparking Plug Patents, Ltd., 464; Unterberg & Helmle, 611

**Incandescent Lamps:** B.T.-H., 233, 420; Bastian, 602, 650; Brimsdown, 233; Fischer, 106; Just, 373; Leiser, 192; Pintsch, 23, 144; Popes' Elec. Lamp, 10, 92; Reeves, 233, 432; Schwarzkopf, 492; Schwarzkopf v. Gladitz and B.T.-H., 295, 373, 397; Siemens, 118; Treuzen, 166, 410; Westinghouse, 178, 206, 386; Wolfram-Lampen, 186

**Switchgear, Fuses and Fittings:** Doulton, 330; Mygatt, 386; Statter, 166, 192; Townson, 178, 310, 410

**Telephony and Telegraphy:** Adlington, 611; Aitken, 492; Automatic Telephone Co., 590; Bijur, 410; Conner & Kahl, 519; Corwin, 440; Drahtlose Telegr., 106; Eastern Telegraph Co., 420; Graham and Ricketts, 178; Jamieson, 10; Kennedy & Turner, 310; Rouzet, 23; Siemens Bros. & Co., 611; Sterling Telephone and Dungle, 590

**Traction:** Auger, 611; Internat. P.A.Y.E. Tramcar Co., 242; Peckham & Thomas, 611; Werndorf, 150

**Miscellaneous:** Adlington, 536; Aron, Wiener and XL Elec. Co., 192; Carey & Waygood, 590; Clarke and Chadburn's Teleg., 150; Close, 192; Corsi, 529; Davies, 92; Doulton & Morris, 630; Foyle and Britannia Folding Box, 134; Grugeon, 536; Handcock, 641; Justice, 602; Keppie and Maddick, 10, 150; Ludicke, 506; Lyon, 350; Musgrave, 118; Scott, 487; Siemens Bros &

## Expired Patents

**Arc Lamps:** Bremer, 77; Cooper Hewitt, 373

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H., 242; Howard, 92

**Dynamos, Motors, and Transformers:** B.T.-H., 432, 641; Berry and Brit.

Co., 546; Statter, 397; Swainson, 564; White, 621; Williams, 446, 621; Wright, 529

## Restorations, &c.

**Electrometallurgy and Electrochemistry:** Schwerin, 134

**Incandescent Lamps:** Wolfram Lamp A.G., 233

**Switchgear, Fuses and Fittings:** Bertram Thomas, 106, 284; Hunter, 397, 564; Vaughan & Birch, 92

**Telephony and Telegraphy:** Tidnam, 23, 410

**Traction:** Reid, 150

**Miscellaneous:** Hawley & Jones, 134; Rich, 77, 260

## Suspensions and Revocations.

**Ignition:** Podszus, 506; Rutharat, 529, 602

**Traction:** Brolt, Brooks & Holt, 641; Goldschmid, 546; Hildebrand & Knorr, 546

**Miscellaneous:** Vulcan Maschinenfabrik, 529, 579; Schuster & Ost, 552; Siemund, 602

Orders to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

We give some particulars of the way in which the electric supply and tramway services in Leeds were kept going during the strike. (Page 2.)

THE annual report of the Chief Inspector of Mines for 1912 records a diminution in the number of electrical accidents below ground, notwithstanding the increased use of electrical apparatus. (Page 3.)

SOME particulars of the electrical equipment of a small mine in Illinois are given. (Page 4.)

A DESIGN of lighting transformer for use underground is described and illustrated. (Page 4.)

THE patent specifications published during December of special interest to mining electrical engineers include one relating to the construction of coal-cutters and several relating to safety lamps. Electrometallurgists will also be interested in a number of patents dealing with electric furnaces, magnetic separators, and the production of metals. (Page 5.)

SOME miners' safety lamps were described by Mr. H. H. Clark, of the United States Bureau of Mines, in a recent lecture. (Page 5.)

AFTER two years' working, the 1,200-volt motors of the Leyden Katwijk direct-current railway are as good as new, and are working with the original brushes. Trouble was at first experienced with the switchgear, and it is found that porcelain is the only satisfactory insulator at this pressure. The 1,200-volt overhead conductor is carried through the streets of Leyden with tramway construction, and no serious accidents have occurred. (Page 6.)

AN International Electrical Congress is to be held

**BINDING "ELECTRICAL ENGINEERING."**—Vol. IX. of "Electrical Engineering" (Jan.—Dec. 1913) closed with our issue of December 25th, 1913. Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to THE KILOWATT PUBLISHING CO., LTD., Temple Chambers, London, E.C., carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad. Binding Cases (including index, but not including binding) 2s. each, or post free 2s. 4d. (Abroad 2s. 6d.) Index alone, 1d. (Post free 2d.).

at San Francisco in 1915 after the meeting of the International Electrotechnical Commission. (Page 6.)

A WATER-POWER scheme involving some 380,000 h.p. from several different sites and a 110,000-volt transmission system is in course of development in Spain. (Page 7.)

A PAPER read by Mr. T. Thorne Baker before the Society of Arts dealt with the effects of electricity on animal and plant life. Experiments were described in which electricity had been used to invigorate plant growth, to destroy blight, to kill cheese mites, and to accelerate the development of chickens in incubators. (Page 7.)

THE light distribution curves of a 2,000 c.p. "Nitra" half-watt tungsten lamp under different conditions are given. (Page 8.)

THE advantages of high and low amounts of reactance in turbo-alternators are discussed in our Questions and Answers columns. (Page 8.)

WE refer to the tramway and trolley 'bus schemes to be promoted next session in Parliament, and to one or two novel uses to which they are to be put.—The London, Brighton & South Coast Railway Co. is asking powers to take current from any electric supply authority upon its suburban lines. (Page 9.)

SEXTUPLE Baudot telegraph working is being introduced between London and Birmingham. The Baudot system is also to be used between London and Liverpool and Glasgow.—The new Anglo-Irish telephone cable is now available for use by the public between London, Manchester, Liverpool, and Ireland.—Telephonic communication between London and Basle, Geneva, and Lausanne is available from to-day. (Page 9.)

THE specifications published by the Patent Office last week include one by R. Pohl and Phoenix Dynamo Mfg. Co. describing how the D.C. pressure of a rotary converter may be adjusted through a booster which is also used as a starting motor. H. J. Dowsing and D. Huntley describe a new type of flexible heating element. The grant of a patent to Pope's Electric Lamp Co. for drawn tungsten filaments is opposed. (Page 10.)

A LIGHTING installation in a London printing works is described, and a new form of controller is illustrated. (Page 12.)

A 5,000 kw. turbo-alternator, condensing plant, rotary converter, and transformer is required at Dundee; water coolers at Manchester; sub-station plant at Haslingden; electrical supplies at Birming-

ham, and motors and starting switches at Swansea.—Loans of £12,160 and £14,000 are contemplated at Rathmines and Basingstoke.—A street arc lighting scheme is being prepared at Stoke-on-Trent, and a large quantity of electrical apparatus, including cable and electric clocks, is required by the Australian Postmaster-General. (Page 13.)

THERE was a serious interruption of supply at Eastbourne last week. (Page 14.)

AFTER a twelve months' trial, the Dublin Corporation has adopted G.E.C. and J. & P. arc lamps for street lighting purposes.—The Chiswick Corporation has decided to work the local electric lighting undertaking when it has been purchased.—A special tariff for internal lighting applicable to consumers using lamps for external lighting has been instituted at Stafford. (Page 14.)

A VERY satisfactory year's business is reported by Holophane, Ltd., and the A.E.G. (Page 14.)

### THE LEEDS STRIKE

WE referred in our last issue to the collapse of the strike of municipal workers in Leeds, but a few notes on the situation as regards the electric supply and tramway services may be of interest. In the case of the electric lighting department, the enginemen and firemen returned to work in a body on Christmas Day, which, of course, practically restored the works to the normal footing, and enabled the Department to dispense with the assistance, which had been so valuable, of the University students and other volunteers. The brunt of the work, of course, had fallen upon the station engineers and those from other branches of the Department's work, such as the Drawing Office and Distribution Department, the officials and loyal workmen from those Departments tackling the unaccustomed duties of stoking, coal-trimming, &c., very effectively. The strikes have brought out the necessity of a loyal official and clerical staff. In the case of tramways, for example, no man who superintends any work such as an inspector, timekeeper, depôt inspector, &c., should be a member of any union. They are thus not bound by any resolution of such union, and should be loyal when a strike is declared by any of the men's unions. In Leeds the strike, as far as the tramways was concerned, was purely sympathetic, no request for any advance being asked by any of the uniform men. A small section who were employed in the repair of the permanent way are members of the Gasworkers' Union, which made the demand, but all the other classes of labour went on strike in sympathy to enforce the demand of the gasworkers. These included blacksmiths, machinemen, fitters, turners, coachbuilders, joiners, painters, plumbers, bricklayers, paviors, enginemen, firemen, power station labourers, and motormen and conductors. Owing, however, to the loyalty of the timekeepers, inspectors, &c., and of the clerical staff, the management were enabled to gather together and encourage a comparatively small number of the motormen and conductors who were willing to turn out on the first morning on which the strike was declared. These men, whose addresses had already been taken, were assisted to the depôts in motor-cars. Adequate protection by the police was arranged, and no difficulty whatever was experienced in starting on the first day a service of about 25 to 30 per cent. of the ordinary regular cars. A marked feature of the whole strike in every department has been the enforced good behaviour of the strikers, who were in almost every case confined to "peaceful persuasion."

Each day it was possible, with the assistance of the staff, to run sufficient plant at the tramway power station between daylight and dark to keep the number of cars referred to in operation. As each day passed the number of cars was augmented, until by the fourth or fifth day a very large number of the men returned to duty. It was then possible to increase the power station staff, and by the end of the week the service had resumed its normal proportions. There is no doubt that the action of the tramways broke the back of the sympathetic strike, in which close on 5,000 municipal employees were engaged. Immediately following the stand taken by the tramways, the men in the Waterworks Department, City Engineer's, Highways, Cleansing, and Gas Departments began to return to work. The Special Committee of the Council, which had been formed with the full powers of the Council, have shown great leniency in giving all the previous employees an opportunity of returning before the vacant positions were filled up. To-day it is three weeks since the first portion, viz., the gasworkers, came out on strike, and at the present moment practically the very fullest requirements of the city with regard to gas are being provided. It should be added that more than anything else the public spirit of the citizens, who were against the strikers almost to a man, no doubt rendered the efforts of the various departments to re-establish the service more easy.

### A HAPPY NEW YEAR

### ARRANGEMENTS FOR THE WEEK

#### FRIDAY, JANUARY 2ND.

*Electro-Harmonic Society.*

8 p.m. Smoking Concert at Holborn Restaurant.

#### SATURDAY, JANUARY 3RD.

*Association of Mining Electrical Engineers.*

5.30 p.m. Warwick and S. Staffs Branch. At Imperial Hotel, Birmingham. "The Choice of Electrical Machinery for Use in Mines," by J. P. C. Kivlen.

#### MONDAY, JANUARY 5TH.

*Institution of Electrical Engineers: Newcastle Students' Section.*

7.30 p.m. At Armstrong College. "The Electrical Equipment of Collieries," by H. S. Ripley.

#### TUESDAY, JANUARY 6TH.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal School of Technology. "D.C. Power in the Machine Shop," by E. Blackmore.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. Meeting at Royal Technical College, Glasgow.

#### WEDNESDAY, JANUARY 7TH.

*Royal Society of Arts.*

5 p.m. Juvenile Lecture I., by R. P. Howgrave-Graham, on "Electric Vibrations and Wireless Telegraphy."

*Institution of Electrical Engineers: Birmingham Section.*

7.30 p.m. At the University. "The Development of Electric Power for Industrial Purposes in India," by H. R. Speyer.

*Batti-Wallahs' Society.*

7.30 p.m. Informal Evening at Victoria Mansions Restaurant.

#### THURSDAY, JANUARY 8TH.

*Institution of Electrical Engineers.*

8 p.m. "British Practice in the Construction of High-Tension Overhead Transmission Lines," by B. Welbourn.

### The London Electrical Engineers.

MONDAY, JANUARY 5TH.—A. Company. Technical Instruction, 7 to 10 p.m.  
TUESDAY, JANUARY 6TH.—B. Company. Technical Instruction, 7 to 10 p.m.  
WEDNESDAY, JANUARY 7TH.—Recruits only. Infantry Drill and Technical Instruction, 7 to 10 p.m.  
THURSDAY, JANUARY 8TH.—C. Company. Technical Instruction, 7 to 10 p.m.  
FRIDAY, JANUARY 9TH.—D. Company. Technical Instruction, 7.30 to 9.30 p.m.  
Special Class on Crossley Engine, 7 to 8 p.m.  
SATURDAY, JANUARY 10TH.—Headquarters open from 10 a.m. till noon.

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

### ELECTRICITY IN MINES IN 1912

THE second part of the general Report of the Chief Inspector of Mines for 1912, which has just been issued contains several references to the extended use of electricity, including the report of Mr. R. Nelson, Electric Inspector of Mines, who states that electricity was newly introduced into 56 mines (including 31 cases in Scotland) in 1912, as against 46 in 1911, and 40 in 1910. The total horse-power of motors is given as 510,756, of which 316,667 were in use underground.

#### Electrical Accidents.

There were twelve fatal electrical accidents involving fourteen deaths during the year; one was due to ignition of fire-damp by electricity and the rest to electric shock. The corresponding fatalities during 1911 were also twelve in number, and involved twelve deaths. The ignition of fire-damp referred to was at Bedwas Colliery, near Newport, on March 27th, when three men were fatally burned. The spark which caused the fire was from an electric bell used for signalling, and after describing the circumstances Mr. Nelson remarks that it was the first recorded occurrence of the kind, and draws attention to regulation 132 of the General Regulations, which reads:—

"In any part of a mine in which inflammable gas, although not normally present, is likely to occur in quantity sufficient to be indicative of danger, the following additional requirements shall be observed:—(1) All cables, apparatus, *signalling wires* and *signalling instruments*, shall be constructed, installed, protected, worked and maintained so that in the normal working thereof there shall be no risk of open sparking."

Several manufacturers have placed on the market signalling apparatus which, in his opinion, fulfil adequately the above requirements.

Of the eleven electric shock accidents above referred to four took place on the surface and seven below ground. The latter figure is lower than it has been since 1906.

Of the four surface accidents, three occurred on medium-pressure alternating-current systems, and the fourth on a medium-pressure direct-current system. Two appear to have been due to working improperly on live apparatus with the full knowledge that the apparatus was live; the other two to misadventure in making contact with live parts. In one of the latter cases the victim made accidental contact with a bare trolley wire in boarding a charging machine from the top of a battery of coke ovens. In the other the victim made accidental contact with a live switch in allowing his hand to rest vaguely on the switchgear controlling a haulage motor of which he had charge. This last was the accident which occurred on a medium-pressure direct-current system; the three first described were on medium-pressure alternating-current systems.

Of the seven underground accidents, one occurred on a high-pressure three-phase alternating-current system, five on medium-pressure three-phase alternating-current systems, and the remaining one on a medium-pressure direct-current system. Three of these were due to absence of earthing of outer coverings of apparatus, and the remaining four were due respectively to inefficient earth connection; direct contact with a live cable exposed through abrasion of the insulation; contact with a girder made live by its contact with a live cable exposed through abrasion of the insulation; and accidental contact with uninsulated live parts of apparatus. Of the accidents on three-phase systems, five were on completely insulated systems and four on systems with the neutral point earthed. Of the eleven fatal electric shock accidents, three occurred to trained electricians, three to coal-cutter attendants, and one each to a coke-oven attendant, a coal hewer, a fireman, a siding attendant, and a motor driver. Of the non-fatal electrical accidents, one was a case of fire-damp ignition, attributed to a spark from an electric bell, at Caerpontpren Colliery, Pontyates, South Wales. Two underground fires were also reported to have been due to electricity in 1912.

The first took place at the Windsor Colliery, Abertridwr, South Wales, on July 30th, but it is reported that no damage was done. The fire was due to the overheating of a resistance grid, which ignited the insulating material on a cable leading

to it. The fire was quickly extinguished. The second fire occurred on October 21st at Bowhill Colliery, Fife, Scotland. In this case a three-core bitumen insulated armoured cable "burst into flame" at a joint. Some pit props, which had in fact been placed on the cable to protect it during "brushing" of the roof, caught fire, and it was some time before the fire was overcome. It was thought that a large stone had previously damaged the joint by falling on it.

Thirty-six non-fatal electric shock accidents causing injury to thirty-six persons were reported during 1912, thirty-three in coal mines and three in metalliferous mines. In many cases the accidents were trifling in their results, but in four cases the victim was unconscious for some time. In one instance complete unconsciousness continued for half-an-hour, and artificial respiration had to be continued for a very long period before the victim fully recovered. A number of instances of successful resuscitation continue to be reported every year.

References to electrical matters also occur in other parts of the report. From the general tables of accidents it would appear that the electrical underground fatal accidents were confined to the Scottish, Northern, Yorkshire and Midland districts, and those on the surface to the Northern, Yorkshire and South Wales districts. The underground electrical fatalities were 0.5 per cent. and the surface fatalities 0.3 per cent. to the totals from all causes. The corresponding average figures for the last five years were 0.9 per cent. and 0.2 per cent.

There were nine prosecutions of officials and seven of workmen for contravention of the electrical regulations, and fines totalling £23 5s. were inflicted.

#### Coal Cutters.

Full statistics are given as regards the use of coal-cutters. Of the total of 2,444 in 626 different collieries, 1,134 (of which 593 were in Scotland and 290 in the Yorkshire district) were electric, against 1,310 driven by compressed air. In the preceding year 998 were electric and 1,148 compressed air. The electrical cutters include 623 disc machines, 345 bar machines, 148 chain machines, 14 percussive machines, and 4 rotary heading machines. The total mineral cut by electricity was nearly 12 million tons, against about 8½ million tons by compressed air.

#### Electric Safety Lamps.

There are some interesting statistics regarding the use of electric miners' lamps. At the end of the year in question there were 10,727 in use, as against only 4,298 a year before. These were distributed as follows:—Scotland, 286; Newcastle, 1,528; Durham, 3,577; York and North Midland, 4,609; Manchester and Ireland, 371; Liverpool and North Wales, 204; South Wales, 71; Midland and Southern, 81. They were of the following makes:—Gray Sussman, 8,381; C.E.A.G., 1,418; Pape, 202; Oldham, 347; other makes, 379.

Of the total of 749,177 lamps of all kinds, 354,974 were ignited electrically and 250,095 had magnetic locks. With regard to the testing of safety lamps it is recorded in another part of the report that the failures of electric lamps have all been due to lack of candle power at the beginning or more generally at the end of a nine-hour run. In certain cases small constructional alterations have had to be made to lamps originally submitted in order to meet requirements. In some instances new batteries were submitted for the tests which had not developed their full capacity, while in others inferior or uneven bulbs were put forward, so that the first tests have on several occasions ended in failure.

**Electric Blasting in South African Mines.**—A discussion on the system of electrically firing large numbers of shots from one station, which is being experimented with in the Rand mines, was held recently by the South African Institute of Electrical Engineers. One member said that firing all the shots simultaneously shook up the ground too much, but Mr. J. H. Rider pointed out that although the ignitions were simultaneous, time fuses of different lengths could be fitted so that the explosions took place one after another. Mr. J. S. Ross explained that this was ordinarily done; it was only in shaft sinking that all the charges were fired together. The great advantage of the system was that all the men could be out of the mine when the shots were fired, and much danger avoided. Several other speakers enlarged on the safety of the system and the smaller number of misfires.

### COAL MINING IN CENTRAL ILLINOIS

COMPLETE electrical driving has been in use in the O'Gara coal mine in Sangamon County, Illinois, for the past few months. According to the *Electrical World* (New York), energy is supplied over a 6,600-volt three-phase transmission line to the motor load of 405 h.p. All the wiring is run in conduit. The mine is fairly dry and practically devoid of dangerous gases, but faults in the structure of the earth are prevalent, and the shafts are lined with concrete to prevent slides. There are two vertical shafts, one of which is used for winding coal. Each shaft has a 216 cub. ft. sump pit, and both are emptied by a single automatic two-stage centrifugal pump direct connected to a 220-volt three-phase squirrel-cage motor running at 1,700 r.p.m., and capable of delivering 50 gallons per minute. This is run for about one hour each day. Coal is raised from a depth of about 300 ft., and a maximum rope speed of 800 ft. per min. is obtained. The cage can carry from 1½ to 2 tons, and the two cars are balanced on the opposite end of the winding ropes, and are driven by a 150-h.p. induction motor with round rotor through single reduction herringbone gearing. It takes eight seconds to accelerate the cages to full speed; eleven seconds are allowed for uniform motion, five seconds for retarding, and six for dumping and caging. A locomotive taking direct current from a 270-volt trolley wire fed from a 100-kw. rotary-converter brings the coal from the coal face to the bottom of the shaft. The locomotive can pull a load of 8 tons. The coal is then raised 30 ft. above the ground, as already mentioned, and dumped into shaker screens 8 ft. wide, 2 ft. deep, and from 12 ft. to 25 ft. long. These are driven by a two-speed squirrel-cage motor. Ventilation is effected by a fan geared to a 50-h.p. two-speed squirrel-cage motor. It is run at full speed while work is progressing, and at other times at half speed.

**Electricity in Mines in South Africa.**—A report recently issued on the mineral industries of South Africa for 1912 mentions that of 411 coal-cutting machines, only 25 were driven electrically. There were during the year under review 14 accidents attributed to electricity, of which 11 were fatal. Six of the fatal cases occurred below ground and five on the surface.

### LIGHTING TRANSFORMERS FOR USE UNDERGROUND

THE accompanying illustrations show a form of transformer which has been specially designed by A. Reyrolle & Co., Ltd. (Hebburn-on-Tyne), for underground use, provided with a cast-iron switch fuse-box with wide machined metal-to-metal joints, sufficiently strong to withstand the maximum pressure inside by the ignition of any mixture of gas and air. The device is thus explosion-proof. The transformer is made suitable for attaching to a main cable and avoiding the use of fuses or switches on the primary side. The top part of the apparatus forms a cable joint-box, and tappings are taken through the connections therein to the

UNDERGROUND TRANSFORMER COMPLETE WITH SEALING-BOX FUSES AND SWITCH.

primary windings of the transformer, the whole being sealed up in a compound. The box, with a hinged lid, contains a single-pole switch interlocked with the lid, and two single-pole ventilated self-aligning porcelain fuse handles. The arrangement for sealing the ends of the main and secondary cables which pass through the apparatus consists of brass glands with clamps for making contact with the armoring. Cone glands are supplied in other designs for this purpose.

**Electric Miners' Lamps.**—At a dinner of the staff of the Tredegar Iron and Coal Co. at Cardiff on December 13th, Mr. A. Lawrence, one of the Directors, who was in the chair, said that the introduction of the electric lamp was a step in the direction of the prevention of disasters.

**Electric Winding.**—In the course of a Paper read before the East of Scotland Branch of the Association of Mining Electrical Engineers at Dunfermline last month, Mr. J. Gillespie, of the Pumpherstone Oil Co., expressed the opinion that there was no rival in the field which could bear comparison with electricity for economy and general adaptability, and it was no uncommon thing to find it in use at every operation about a colliery which could be cheapened or facilitated by means of applied energy. He was not so much in favour of electricity for main-shaft winding, and said that the retention of steam for the purpose rendered exhaust steam turbo-generators available from which electric power for the other work of the mine could be obtained economically.

**Electrical Mining Fatalities.**—At Foleshill last week an inquiry was opened into the death of G. O. Randle, assistant electrician at Exhall Colliery, on December 22nd. The deceased was splicing a cable when by some means the circuit was made alive, and he received a fatal shock. Artificial respiration was tried for three hours unsuccessfully. The inquest was adjourned until to-day.

In another accident on December 3rd, near the No. 3 pit of the United Collieries at Carfin, a young man named Ormonde, who was engaged on repairing telephone wires, received a fatal shock, owing to one of the telephone wires coming into contact with a high-tension power wire, and a portion of it also touching a wire fence upon which the man had his hand.

On December 11th an inquiry was held at Dunfermline into the circumstances attending the death of W. Laurenson on Oct. 31st in the Mary Pit, Lochore, from shock received by coming into contact with a girder which was touched by an abraded lighting cable. It appeared from the evidence that the girder had settled and cut into the cable in question. Mr. R. Nelson (H.M. Electrical Inspector of Mines) expressed the opinion that too high a voltage was used for lighting, and finally the jury made the following recommendations:—(1) That the present high voltage should at once be reduced; (2) that in exposed and dangerous places the cable should be so constructed as to prevent an accident such as had occurred; (3) that officials who were likely to be required should receive instruction which would help to prevent accident.

## ELECTRICAL MINING AND METALLURGICAL PATENTS OF DECEMBER

THE following specifications published by the Patent Office during the month of December are of particular interest to electrical mining and metallurgical engineers:—

No. 6,627, of 1913, by Beckett and Anderson and R. C. Anderson, of Glasgow, deals with the construction of electrically-driven coal-cutters in which a single motor is used both for driving the cutting element and for propulsion. The motor armature is on a horizontal shaft between two bearings, while a second horizontal shaft in axial alignment with the first is supported by a single bearing situated between a bevel pinion and one element of a clutch, the other element of which is carried on the adjacent end of the armature shaft. The bevel pinion continually drives the cutter through gearing.

In specification No. 28,772, of 1912, P. Rosenberg (Berlin) describes how, in a miners' safety lamp, by a particular construction of the outer part of the cover, a more effective distribution of light is produced than is the case with lamps of ordinary construction. The lamp bulb is contained in a receptacle having a positive closure controlled by a magnet, and having the surface inclined at about 45° by a part connected to a bayonet closure so as not to obstruct the light in a downward direction. In specification 6,700, of 1913, it is shown by P. Wolf (Friemann & Wolf, of Zwickau, Saxony) how the bulbs in safety lamps may be conveniently fixed and removed by removing only the battery holder. This is effected by a special design of lamp bulb and base plate having spring contacts. F. Palmer, of Wellington, New Zealand, describes a semi-portable lamp for mines in specification No. 27,714, of 1912. In order to provide that the lamp compartment may be situated at any distance from a closed chamber containing the switch contacts, the two are connected by a flexible tube holding the leads and allowing the passage of air. The switching is effected by air pressure acting on a diaphragm in the closed chamber. Should the tube or the glass of the lamp chamber be broken, the air will escape and so break the circuit by allowing the diaphragm switch to open.

Specification 17,261, of 1913, by H. J. von Klaeden, of Breslau, Germany, covers the use of a cable for firing explosive charges in which one wire is not interrupted, while the other is composed of sections adapted to be connected by plug contacts so that all connecting points are mounted in series.

The following specifications, also published during December, are of special interest to electro-metallurgists. In No. 22,723, of 1913, E. Stassano (Turin) gives an improvement to permit of the furnace chamber of an arc furnace being adjusted by hand, as well as by motor, in order to regulate the height of its tap hole for casting purposes. A sliding pinion on the furnace shaft may be moved by pedal control into engagement with another wheel connected to the hand-wheel. In 22,724, of 1913, the same inventor gives a method of mounting the electrodes so that the wall of the furnace chamber may be cooled by circulating water without the need for any play being provided in the aperture through which the electrode has passed. In specification No. 2,577, of 1913, A. Helfenstein (Vienna) describes a furnace with electrodes passing through an imposed charging receptacle having the distinguishing feature that inside the charging receptacle above the charging opening gas chambers are constructed on the sides, through which the reaction gases ascending from the furnace are drawn off. The packing of these chambers against the ingress of air from above is effected by the column of mixture situated above. The charging of arc furnaces is also dealt with by Helfenstein Elektro-Ofen Ges., of Vienna, in specification No. 9,590, of 1913. The furnace has upper charging chutes arranged above joint hearths, so that the charging material forms the shortest electrical connection between the electrodes. The chutes are arranged between the upper pairs of vertical electrodes. The intermediate spaces, through which the electrodes pass, are utilised for receiving part of the charge. All the chutes are fed from the same platform by the use of feed-tubes.

The reduction of zinc ores in an electric furnace is treated of by W. A. Johnson (Hartford, U.S.A.), in specification No. 27,881/12. The sulphiding of the zinc vapours is effected by first reducing the ore so that sufficient iron and copper are formed to take up all the sulphur. The treatment of other impurities is given. In specification No. 18,449, of 1912, R. W. Wallace and E. Wassmer (London) describe a process for preparing metallic magnesium which consists in treating a mixture of the chloride and sulphide in an

electrolytic bath. Friedr. Krupp A. G. (Essen) give, in specification No. 17,925, of 1913, a construction of electrode having a metallic cooled head. This fits loosely by means of a shank into the electrode, the intervening space being filled with an easily fusible metal, and the shank being able to carry the electrode even when the space is not filled up.

Maschinenbau-Astalt Humboldt (Cöln-Kalk, Germany) has described in specification No. 11,430, of 1913, how the field strength of a rotary magnetic separator may be controlled by rotatably arranging one or more of the poles in the vertical plane of the movement of the material to be separated, e.g., the pole-pieces may be moved on a concave or convex seat, and locked in any known manner. Another specification relating to separators is No. 12,368, of 1913. In this H. J. H. Nathorst, of Malmberget, Sweden, describes a construction in which a cylindrical drum rotates about a stationary system of magnets. There are an odd number of poles, and the core of each outermost pole has a lesser cross-section than the core of the nearest inside-situated pole. Both the outermost poles have the same polarity.

## MINERS' ELECTRIC SAFETY LAMPS

IN a recent lecture before the Coal Mining Institute of America, at Pittsburgh, Mr. H. H. Clark, who is the engineer in charge of the electrical investigations for the United States Bureau of Mines, said that portable electric mine lamps represented a comparatively new development in America. While actual tests had shown that glowing filaments were capable of igniting explosive gas mixtures, it had also been shown that pressures below six volts will not ordinarily ignite mine gas. As minimum quantitative requirements for a satisfactory safety lamp the Bureau of Mines offers the following specification:—Intensity of light, 0.4 c.p.; flux of light for hand lamps, 3.0 lumens, and for cap lamps, 1.5 lumens; average life of bulbs, 300 hours; average life of batteries, 3,600 hours; time of burning on one charge, twelve hours; variation in energy consumption of bulbs, 10 per cent.; angle of reflector, 100°. Six lamps were recently submitted for test, and three were accepted. These were the Ceag, Hirsch and Wico lamps. The former is now well known in this country. The Hirsch lamp is a cap lamp, and has an open-circuiting device which protects it against blows from the front. A slip of glass mounted across the bull's-eye holds in closed position an open-circuiting spring, which is released on breakage of the glass. Protection from other directions is afforded by constructing the headpiece of three concentric metal shells, the inner and outer being connected to the positive and the intermediate shell to the negative terminal of the battery. Any injury which could break the lamp bulb will jam these shells together and short-circuit the battery. The Wico lamp, which is also a cap lamp, has the bulb held in its socket by a wire stirrup against the pressure of springs, which act to eject it should the stirrup be removed or a spring broken.

**Fine under the Special Rules.**—At Airdrie on December 1st D. Reid, electrician, and J. Eadie, manager, Blairmuckhill Colliery, Harthill, pleaded guilty to failing to make a thorough examination of the electrical apparatus in the colliery, and failing to have certain cables properly covered with insulating material. The Sheriff considered that the person primarily responsible was the electrician, whom he fined £5. No penalty was imposed on the manager.

**The Association of Mining Electrical Engineers.**—A public meeting promoted by the West of Scotland Branch was held at Hamilton Town Hall on December 20th, when an address on the objects of the association was given by Mr. D. M. Mowat, and a lecture on the transmission of electrical power by Mr. A. Anderson. At the meeting on the same day of the Notts and Derby Branch, Mr. L. G. F. Routledge gave his chairman's address, emphasising the increasing responsibility of the colliery electrician, and Papers by Mr. J. Bentham on testing transformers and by Mr. J. F. Arnst on colliery equipment were discussed. At the meeting of the Yorkshire Branch, also on December 20th, Mr. H. C. Jenkins read a Paper on the choice of electrical machinery for use in mines, which provoked a lively discussion.

## WORKING EXPERIENCES ON A 1,200-VOLT D.C. LIGHT RAILWAY

A highly interesting account of the results of the first two years' working of a 1,200-volt direct-current railway in Holland was published in the *Elektrotechnische Zeitschrift* recently. This is a full-gauge line connecting Leyden with the seaside towns of Katwijk and Noordwijk, and has a route-length of 11.8 miles, of which 8.4 miles is double track.

The equipment was fully described in the *Schweizerische Elektrotechnische Zeitschrift* of Dec. 28th, 1912. There are no appreciable gradients, but owing to the numerous sharp curves and the fact that the track runs partly on the main road and partly through the streets of Leyden, the maximum speeds are limited to 25 miles per hour outside, and 12.5 miles per hour inside the towns. The rolling-stock consists of 10 two-axle motor cars, each equipped with two 80 h.p. motors, and 12 lighter cars with two 30 h.p. motors, besides a number of trailers and goods cars. The four-pole series interpole motors are controlled on the usual series-parallel system, and the series fields are provided with shunting resistances in two steps. The 80 sq. mm. copper contact wire outside the town is suspended by bronze hangers from a simple catenary of 50 sq. mm. bronze wire. No steel or iron wire was employed, owing to the proximity of the sea, but steel lattice poles are used throughout with the exception of the two mile section in Leyden, where tubular poles and span wire construction are employed. On the outside sections double porcelain insulation is adopted. The catenary wire is strung up to the porcelain insulators by flexible bronze fittings especially designed to avoid breaks of the wire at these points, and the wire is made electrically continuous by connecting loops. On the city section no catenary is employed, and the insulation consists of two hard-rubber and one porcelain insulator. The cars are fitted with bow collectors. Current is supplied from a station in Leyden direct to the contact conductor, and through two 310 sq. mm. 1,200 volt feeders to Rynsburg, some four miles out, where the line branches. The track return is assisted by two 310 sq. mm. negative feeders running half the distance to Rynsburg. Horn lightning arresters are installed every 1,000 yards.

In describing the working results in the E.T.Z., Herr H. J. Mulder points out that the equipment was designed in the year 1910, before much experience had been obtained in high-tension direct-current working, and that some troubles were to be expected. From the very first, however, the motors behaved excellently, and up to the present time, after an average service of 31,000 miles per motor-car, not one commutator has been turned or needs turning, and not one brush has yet been renewed.

The switchgear gave some trouble at first. Such 1,000-volt direct-current switchgear as was then on the market was found to be unsuitable, and an attempt to use standard H.T. oil switches ended disastrously. Any form of knife-contact on automatic switches was found to be useless, as the formation of copper beads made the action uncertain. Finally, however, the now usual form of D.C. circuit-breaker, with flat laminated copper contact faces with auxiliary copper and carbon breaks, was adopted with success.

Insulation troubles in the car switching equipments occurred at first, and it was found that only porcelain, also in some cases impregnated wood, could stand the 1,200 volts. Any hygroscopic material, including marble, which was used for the mounting of the circuit-breaker on the roof of the car, broke down after a time—due, the author considers, partly to electrolytic action and partly to the penetration of conducting particles of rust, &c., into the body of the marble. He considers, therefore, that only porcelain insulation should be employed for D.C. work over 1,000 volts. Surface conduction also takes place, and the use of ribbed insulators mounted on earthed iron frames is recommended.

The hard-rubber section insulators and other fittings have given some trouble, as a conducting path was soon formed in a crack, and even surface conduction sometimes raised the span wires in the town to high potential, the porcelain insulators between these wires and the walls or poles being alone effective. The section insulators should be longer than normal, as with a 10-inch length between a live and a dead section, a passing car taking only two or three amperes for lighting could easily draw out an arc and cause a short-circuit. Another arcing effect has been noticed in connection with the lighting. The lamps for lighting, signal lamps, and indicator-board lamps, twenty-one in all, are 20-watt Tantalum lamps connected in three circuits, seven in series in each, or 170 volts per lamp. They are all of the Edison screwed-socket pattern, and if one is unscrewed out some 10 or 12 mm., it draws out an arc in the socket and the lamps burn as before. Vibration may cause a lamp to loosen

in this way, and to prevent the slight arcing from causing fires, it is recommended that the socket should be of such a pattern that the arc inside cannot set alight the connecting wires. It is also necessary that all wiring should be in continuous metal conduit, well earthed, and that any hygroscopic material round the rubber insulation of the conductors should be stripped off near terminals so that it does not come in contact with the live metal.

Only two faults occurred in the power and lighting wiring circuits during the two years' working, and both were caused by poorly insulated leads between amperemeters and their shunts. As a testing pressure for 1,200-volt D.C. equipments, 5,000-volt A.C. is recommended; 8,000 volts A.C. was found to be insufficient. It has been noticed that when the track is copiously sanded the cars may become completely insulated, so that the whole of the metal frame is brought to contact-line pressure. To avoid this risk it is proposed to insert a minimum current relay in the pressure coils, so that on the car-wheels becoming insulated the main circuit-breaker is operated. Neither during construction nor during the two years' working has there been a single fatal accident. Cases have occurred of persons coming in contact with the 1,200-volt conductors, but only slight burns were experienced. The overhead construction in the town is of the normal tramway type with the exception of the additional porcelain insulators between the span wires and the wall-rosettes or poles, and no trouble has been experienced in spite of the high pressure of 1,200 volts except that the crack or surface creepage of the hard-rubber insulating fittings caused the span wires to be alive. For this reason, however, it is suggested that the insulation of future installations should be porcelain throughout.

## INTERNATIONAL ELECTRICAL CONGRESS, SAN FRANCISCO, 1915

THE International Electrical Congress is to be held at San Francisco, September 13th to 18th, 1915, under the auspices of the American Institute of Electrical Engineers, by authority of the International Electrotechnical Commission, and during the Panama-Pacific International Exposition. Dr. C. P. Steinmetz has accepted the Honorary Presidency of the Congress. The deliberations of the Congress will be divided among twelve sections, which will deal exclusively with electricity and electrical practice. There will probably be about 250 papers. The first membership invitations will be issued in February or March, 1914. Attention is drawn to the distinction between this Electrical Congress and the International Engineering Congress which will be held at San Francisco during the week immediately following the electrical congress. The engineering congress is supported by the Societies of Civil, Mechanical, and Marine Engineers, and by the Institutes of Mining and Electrical Engineers, as well as by prominent Pacific Coast engineers, who are actively engaged in organising it. This Congress will deal with engineering in a general sense, electrical engineering subjects being limited to one of the eleven sections which will include about twelve papers, treating more particularly applications of electricity in engineering work. The meeting of the International Electrotechnical Commission will be held during the week preceding that of the Electrical Congress.

**Electricity and Food Supply.**—Dr. C. V. Drysdale gave a lecture before the students' section of the Institution of Electrical Engineers on Nov. 26th, entitled "The Food Supply and the Electrical Engineer." He said that the principal hope for combating the exhaustion of the available stores of fertilising material lay in the production of nitrates from the atmosphere by electrical methods. The Birkeland-Eyde process of directly combining the nitrogen and oxygen of the air by an electric arc has come into operation on a large scale in Norway, and about 300,000 h.p. of water power is now utilised, fixing 35 million pounds of nitrogen annually. Another and even more largely used process is the production of calcium cyanamide or nitrolim by the Franck Caro method, a compound which splits up into lime and ammonia in the soil. About 90 million pounds of nitrogen are now annually fixed by this process, making about 125 million pounds in all. It is shown that this amount is only sufficient to increase the world's harvest of cereals by less than 1 per cent., and the needs of an unrestricted population would demand a present increase of 30 per cent., and a 4 per cent. further increase each year. There was therefore little likelihood of supply equalling demand. Suggestions were also made as to the utilisation of electrical power for ploughing and subsoil treatment for "dry farming," for increasing rainfall, electrolysis of the soil, supplying ultra-violet radiation, &c. The possibility of employing the solar energy directly for the fixation of nitrogen was also considered.

## AN IMPORTANT SPANISH WATER POWER UNDERTAKING

**A**N electric power undertaking involving the utilisation of 380,000 h.p. of water-power and the transmission of the greater part of the available energy to a city 100 miles distant is in course of development in Spain. The work is being carried out by the Riegos y Fuerza del Ebro S.A. (The Ebro Irrigation & Power Co., Ltd.), a subsidiary company to the Barcelona Traction, Light & Power Co., which has bought up or obtained a controlling interest in all the electric supply and tramway companies in and around Barcelona. The scheme includes the development of six different water powers of the river Ebro and its tributaries, and transmission of the power to Barcelona. One station, at Pobla, on the river Noguera Pallaresa, is already in operation, supplying some 1,200 kw. chiefly for constructional work at Tremp, farther down the same river, where a huge dam is under construction. This is 86 metres high and 150 meters long at the top, and when complete will cause a large area of land to be flooded, thus creating a huge storage reservoir. The water will be taken through a tunnel and a canal, and utilised in two falls, one near the dam and one some ten miles farther down the river, giving a total of nearly 100,000 h.p. A fourth station will be erected later at the junction of this river with the river Segre. At Lerida, some distance down the Segre, a 7-meter dam has been constructed, and the power station at Seros at the end of the 16-mile canal, is nearly complete. This station contains four generating units of 10,000 kw. each, with space for a fifth. The sixth development will be on the river Ebro itself, at Fayon, where some 150,000 h.p. will be available.

Power will be generated in all cases at 6,000 volts, three-phase, 50 cycles, and will be transmitted at 110,000 volts over a double-circuit transmission line on steel towers spaced on an average 220 meters apart, to a large transformer sub-station about two and a half miles outside the city of Barcelona. This substation is now being equipped for dealing with 100,000 k.v.a., and from here the power will be distributed at 25,000 volts to the manufacturing centres outside Barcelona by overhead lines, and by underground cables to a secondary distributing sub-station in Barcelona, where the current will be transformed from 25,000 volts to 6,000 volts. There is already an extensive 6,000-volt network in Barcelona with some 80,000 h.p. connected in power and lighting, and supplied from a large steam station of 50,000-kw. capacity. This load will ultimately be transferred to the hydro-electric system, and the steam plant retained as a reserve. Besides the large sub-station outside Barcelona, there is a second 110,000-volt sub-station at Igualada for the supply of the surrounding district. The company has already secured a large number of important contracts for the supply of power to textile and other factories, and the local tramways and light railways will also receive power from this system. At Lerida, a large factory for the electrical fixation of nitrogen and the manufacture of artificial fertilisers is now under construction. This will operate twenty or more arc furnaces, taking nearly 1,000 kw. each on a continuous load day and night.

Another subsidiary company of the Barcelona Traction, Light & Power Co. is the Cataluña Railway Co., which is extending the existing 600-volt light railway from Barcelona to Sarria, out to the towns of San Cugat, Tarrasa and Sabadell. The new lines now under construction have a route length of twenty-five miles, and will be operated at 1,200 volts direct-current, the cars running on the old section at 600 volts as before. Power for this railway will be obtained from two or more rotary-converter sub-stations supplied from the 25,000-volt distributing network.

**Northampton Engineering College Union Society Magazine.**—The first number of the second volume of this publication has just been sent us. In this a somewhat different plan is being pursued than was the case previously as "the element of humour is being given a more prominent position." Apart from much of the "humour," which we should imagine would not appeal to the many, there is considerable information as to the activities of the Union, as well as short interesting notes on different branches of engineering, including some remarks on rotary converters by N. E. Paine.

**Prize Competition.**—The Council of the Society of Engineers (Incorporated) may award in 1914 a premium of books or instruments to the value of £10 10s., for an approved essay on "The Status of the Engineering Profession." The Council reserve the right to withhold the premium if the essays received are not of a sufficient standard of merit. The competition is open to all, but, before entering, application for detailed particulars should be made to the Secretary, 17 Victoria Street, Westminster. The last date for receiving essays is May 30th, 1914.

## EFFECTS OF ELECTRICITY ON ANIMAL AND PLANT LIFE

**A**PAPER entitled "Physiological Effects of High-frequency Currents," by Mr. T. Thorne Baker, was read before the Royal Society of Arts on December 10th. After a brief reference to the pioneer work of Lemstrom and others, the author described results of some experiments of his own, undertaken at the suggestion of Dr. Arabella Kenealy, with a view to elucidating the causes of these effects. He noticed first of all from measurements with a sensitive capillary electrometer that the upper and lower halves of the human body are usually at different potentials, the upper part being negative and the lower part positive. Measurements were made also with growing plants, and it was found that the upper portion of the plant was negative, the roots positive. It was suggested that in some way this charge is collected from the atmosphere, and that these feeble differences of potential (of the order of a few milli-volts) are of intrinsic use in the natural processes of the plant. The effect of electrification might be due to several things; the static effect might cause a contraction in the capillary tubes, and also affect the passage of fluids through the structure by osmotic action. The facilitation of flow of liquids through capillary tubes is confirmed by the changes of blood-pressure produced by feeble oscillatory currents of high frequency. After speaking of the well-known work of Lodge and Newman, the author passed on to his own experiments with high-frequency currents. In the apparatus which he employed, each end of the secondary of an induction coil is attached to one coating of a condenser, the other coatings leading to the spark-gap, in one instance through a few turns of a large inductance or resonator. The free end of the resonator produces an "effluve" discharge, which gives the most pronounced results when the capacity and inductance product of the condensers and few turns of inductance equals the capacity and inductance product of the whole resonator. In a modification of the apparatus, stationary waves could be produced. The "effluve" discharge has remarkable effects in destroying blight in plants when used in conjunction with certain chemicals, and can be used for destroying cheese mites. By attaching a brush of fine silver hairs in an ebonite handle to the high-frequency apparatus, and brushing over the surface of the cheese with it, the surface organisms were destroyed, and a cheese, the rind of which had not actually been penetrated by the mites, could be thus rendered immune from deterioration. It is noteworthy that in this instance the intensity of the discharge and its physical character required special consideration, as it was found that by having a different type of effluve the mites were not only not killed, but were actually invigorated. A similar effect was found in investigating a fungus which attacks dried cod in the Norwegian fishing industry.

Mr. Thorne Baker then gave some particulars of the effect of radioactive earths on plants where, with a minute amount of radioactive residues, a very marked increase in the rate of growth was observed, but here again too large a proportion of radioactive material appeared to check the growth.

Returning to his experiments on the application of electrical stimulus to animal life, he said that chickens in incubators could be grown at about double the usual rate in an electric field, and at the same time the percentage mortality much diminished. In experiments at Mr. R. Meech's poultry farm at Poole, an intensive chicken-house, consisting of six flats, each large enough to accommodate seventy-five chickens, was electrified by a large helix of heavily insulated wire wound round it in turns about 6 in. apart. The current was applied for ten minutes every hour during the day. Six chickens only out of a total of 400 died, showing a mortality of only 1.5 per cent., and the chickens were ready for market despatch in five weeks as against three months.

**Air Filtration.**—At a students' meeting held at the Institution of Civil Engineers on Dec. 19th. Mr. W. E. Gurry read a Paper on air filtration and cooling and ventilating electrical machines. The chair was taken by Mr. J. S. Highfield. The author dealt with the general principles of, and the plant used for, air filtration and the cooling and ventilating of electrical generators. The Paper was illustrated by a number of lantern slides. The discussion was opened by Mr. W. Fanghaenel and continued by Messrs. P. G. Bowie and H. E. Denny. The author having replied, the Chairman, in his remarks, expressed the hope that the author would enlarge upon one of the matters lightly touched upon in his Paper, namely, the gasifying of coal and the recovery of the by-products, the use of the gas as fuel for generating steam and of the by-products for many and varied purposes.

## HALF-WATT LAMPS

THE November issue of the *A.E.G. Journal* contains an account by Dr. K. Mey of the development of the "Nitra" half-watt lamp. In addition to information concerning these nitrogen-filled lamps, already given in *ELECTRICAL ENGINEERING*, the light distribution curves of a 2,000-c.p. lamp with conical filament are included. These are given in Figs. 1 to 4, for the lamp alone; for the lamp in fitting, without external reflector, but with clear glass globe; with reflector and clear glass globe; and with reflector and opalescent globe. It has been shown by means of oscillograms that the

FIG. 1.—LIGHT DISTRIBUTION FROM NAKED "NITRA" LAMP.

FIG. 2.—LAMP IN FITTING WITH CLEAR GLOBE.

current rush at the moment of switching on these lamps is of extremely short duration, and therefore quite harmless. The lamps are so dimensioned that they have a consumption of 0.5 watt per mean lower hemispherical candle-power. This corresponds to an average light intensity in a room of 0.65 watt per c.p. As a luminous spiral of 1 sq. mm. gives a light of approximately 10<sup>7</sup> c.p. (the spiral of a 1,000-c.p. lamp for 110 volts is about 15 cm. long and 0.64 mm. in diameter), these lamps must be used in light-dispersing globes when hung in the line of vision. An opal globe occasioning

FIG. 3.—LAMP IN FITTING WITH REFLECTOR AND CLEAR GLOBE.

FIG. 4.—LAMP IN FITTING WITH REFLECTOR AND OPALESCENT GLOBE.

a loss of light of about 7 per cent. is recommended. Dr. Mey estimates the temperature of the filament at about 2,400° C. compared with 2,100° C. for ordinary tungsten filaments.

The new lamps are manufactured at present for candle powers from 600 to 3,000 c.p., but these figures by no means represent the limits either upwards or downwards. There is, however, very little demand for lamps with a greater light intensity than 3,000 c.p. It is probable, however, that lamps will be constructed for lower powers than 600 c.p. Suitable fittings, adapted to the special nature of the new lamp, have been constructed in accordance with the designs of Professor Behrens, and have been placed on the market simultaneously.

**Technical College Announcements.**—A series of advanced lectures on the design of generating stations, including a consideration of steam, gas and oil engines, and generators, will be given at the Battersea Polytechnic by Mr. W. H. Patchell on Mondays, January 19th and 26th, February 2nd, 9th, and 16th, at 7.30 p.m. Admission will be free, and no ticket will be required. The new course at the Crystal Palace School of Practical Engineering will commence on Wednesday, January 7th. New students should attend the previous day between 10 a.m. and 1 p.m. A prospectus will be forwarded on application to the Registrar, School of Engineering, Crystal Palace, S.E.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper, attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,372.

When slow-speed alternators of low reactance and fine regulation are coupled in parallel with high-speed turbo-generators with high reactance and coarse regulation, can the voltage of the circuit be kept constant by installing one automatic regulator? If this be possible, and as the load saturation characteristics of the two types of alternators must differ, how is the excitation point determined at which connection should be made to the regulator, in order to obtain the best results as regards constant voltage?—"X."

(Replies must be received not later than first post, Thursday, January 8th.)

### ANSWERS TO No. 1,370.

In modern turbo-generators of large capacity, what is the usual percentage of reactance? What are the advantages and disadvantages of high reactance?—A. S. T. I.

The first award is given to "D. C. W." for the following reply:—

The reactance of a large modern turbo-generator, or the voltage absorbed by the self-induction of the stator winding, is generally from 5 to 8 per cent. In other words, the inductive drop with full-load current is 5 to 8 per cent. of the generator terminal pressure. This inductive drop added in the correct phase relation to the CR drop gives the total percentage voltage drop on load exclusive of armature reaction. Another reason for expressing it as a percentage is that if divided into 100, it gives approximately the instantaneous value of the first rush of current on short circuit, as the whole of the terminal pressure must be dissipated in the armature self induction and resistance until armature reaction comes into play and reduces the generated pressure. With a view to ensuring good regulation it was customary to limit the reactance to 2 or 3 per cent. only, and as a result the current rush on short-circuit was fifty to thirty times full-load current. This caused disastrous strains on the end connections, particularly as the mechanical strains increase as the square of the current. By increasing the reactance to 6 per cent. or more, the instantaneous short-circuit current is reduced to a relatively harmless value, while the regulation may be maintained with the aid of a Tirrill or other automatic regulator. The higher reactance machine is also less expensive to build. Some engineers, however, prefer to insert external reactances in series with the machine, with the object of preventing high-frequency surges reaching the machine and building up a high voltage across the end turns of the winding. In such cases the internal reactance of the machine should not be more than 4 or 5 per cent., as the total reactance should not exceed 10 or 12 per cent. Too much reactance is detrimental to both regulation and power factor. In the case of the external reactances supplied for the 5,000-kw. 6,600-volt 25-cycle single-phase machines at Deptford for the L.B. & S.C. railway load, it has been stated that the reactances absorb less than 3.5 per cent. of the generator pressure, and that they effect less than 3 per cent. reduction in the power factor. These machines have probably a fairly high internal reactance. On the other hand, the 5,000-kw. machines at the Greenwich L.C.C. tramway station

have a reactance of from 2 to 3 per cent. only, as they have recently been fitted with 10 per cent. reactances (see *ELECTRICAL ENGINEERING*, September 11th, 1913, p. 515), increasing the total reactance to 12 or 13 per cent., and limiting the instantaneous short-circuit current to seven or eight times full-load current.

The second award (5s.) is made to "S. F.," who writes as follows:—

Turbo-generators have widely different reactances, depending on the design of machine, but a fair average is 5 to 6 per cent. The modern tendency is to increase the reactance so as to minimise the disastrous results of short circuits. Water turbos have usually double the above reactance, and slow-speed engines still higher values. The percentage reactance is given in terms of the reactive volt drop across each winding at normal current and frequency, expressed as a percentage of the "star" voltage of the machine.

The chief advantage of high reactance is to reduce the magnitude of current which would flow under faulty conditions, and the chief disadvantage is poor regulation. On sudden short circuit an alternator gives twenty to fifty times normal current initially, which drops down to about three times normal in a few seconds. The reason for this heavy current is that armature reaction takes some little time to become effective, and initially the current is limited only by the reactance of the armature (the resistance being negligible). If this was constant the initial current would equal  $V/r$ , where  $V$ =running voltage and  $r$ =reactance. The reactance, however, varies with the current owing to saturation, and decreases as the current increases, so that the initial short-circuit current would be higher than that obtained by the above formula.

Prof. Miles Walker has shown in his Paper before the I.E.E. (March 10th, 1910) the enormous magnetic forces developed on sudden short circuit, which vary as the square of the current and are very destructive to the alternator and system generally. The trouble which has been experienced in this direction has led to the increase in the value of the reactance in later machines, and also the supply of external reactances. The latter accomplish the same object as the former. Mr. E. B. Merriam, in testing a 12,000-kw. 9,000-volt, three-phase turbo-alternator belonging to the Commonwealth Edison Co. found that the initial short-circuit current was reduced to one-half by the introduction of 6 per cent. external reactance. It is obvious that the higher the reactance of a generator the poorer will be its regulation, but this is not serious in view of the general adoption of automatic voltage regulators. The advantages of "high" reactance quite outweigh its disadvantages.

"B.C." writes us as follows:—

"It is desired to internally coat a steel tank, 30 ft. by 10 ft. by 4 ft. with electrolytically deposited lead to a thickness of 1/32 in. Give the constituents of a suitable solution and the best strength of current to be used. Will the steel tank have to be specially prepared, and, if so, give a suitable solution for this."

Perhaps some of our readers can help him.

### ELECTRIC TRACTION NOTES

The Northern General Transport Co., which has been formed with a capital of £250,000 in ordinary shares, and £150,000 in 6 per cent. preference shares, has for its object the consolidation of the interests of the Gateshead & District Tramways Co., the Tynemouth & District Electric Traction Co., and the Jarrow & District Electric Traction Co.

The new company which it is proposed to incorporate for constructing a tube railway under the Tyne between North and South Shields is to have a capital of £200,000. The promoters are J. R. Hogg, W. Hutchinson, S. Hobson, J. C. Eddington and E. K. Honey. An Act for a similar railway was passed some years ago, but the time-limit for its construction was allowed to expire without anything having been done.

In its Bill before Parliament next session, the London, Brighton & South Coast Railway Co. is asking for powers to make agreements with electric supply authorities at any point on its suburban system, and also seeks to make binding upon any purchasing authority the existing contracts which the Railway Co. has in connection with the supply of electrical energy to its railways. Presumably this has reference to the possible purchase of the London Electric Supply Corporation, from whom the Railway Co. at present obtains its supply, by the London County Council.

Very considerable sums of money are proposed to be spent upon tramway and trolley omnibus schemes in the Bills which will come before Parliament next session. Two new trolley omnibus companies are to be formed, viz., the Bournemouth District Railless Traction Co., with a capital of £10,000, and the Sandbanks Railless Electric Car Co., which will also operate in the Bournemouth district. Among the interesting uses to which trolley omnibuses are proposed to be put is the conveyance of goods and passengers between the North Eastern Railway Co.'s Newcastle and Gateshead West stations, whilst the Walsall Corporation are asking powers to utilise vehicles operated on the trolley-bus system for sanitary and road-watering purposes. A feature of the tramway schemes is the number of applications for the use of trailer and coupled carriages, a policy of much interest in view of the successful use of these in London notwithstanding the very strenuous opposition of the police authorities at the time the L.C.C. applied for its powers.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

From to-day direct telephonic communication is possible between most subscribers' telephones and call offices in the City and West End of London to Basle, Geneva and Lausanne via either of the two loaded Anglo-French telephone cables and Paris. There is now a direct service between Paris and Basle and Geneva, and a service to Lausanne from Paris through Dijon. None of the land lines are loaded. As speech is only just commercially possible, it is recommended that calls be made from the "Paris" call office, G.P.O. West, Roman Bath Street, Newgate Street, E.C., which is directly connected with the trunk exchange. Descriptions of the two loaded cross-channel cables in question appeared in *ELECTRICAL ENGINEERING*, Vol. VI., pp. 179 and 807, and Vol. VIII., pp. 77 and 137.

The four-core Pupin loaded Anglo-Irish submarine cable, described in *ELECTRICAL ENGINEERING* for November 6th, 1913, p. 622, Vol. IX., is now in use. It may be remembered that the cable was made in two halves, and the first of these was laid by the Post Office cable ship *Monarch* on November 11th, from Nevin, in Carnarvonshire, and the end buoyed. The *Monarch* then returned to Woolwich and fetched the second half, which was successfully laid from Howth, near Dublin, on December 13th, when the two ends were joined together in mid-channel, as described in the previous article. The cable is also designed for phantom working, and the tests have shown that the attenuation constants of the three circuits are slightly better than those specified. There is, however, a little overhearing between the phantom and physical circuits, but this will probably be reduced when the land-lines are connected for phantom working. The physical circuits have been in use between London, Manchester, Liverpool and Ireland since December 15th, but the phantom cannot be used until the two physical circuits from these cities to the cable station are arranged on the same pole lines, so that the necessary balancing may be obtained.

At the central office of the Guernsey States Telephone Department on Dec. 20th a presentation was made to Major-General F. B. Mainguy, who is retiring after fifteen years' service as President of the Guernsey State Telephone Council. The chair was taken by Jurat J. Esten de Jersey, the new President, and Mr. R. McLean (Manager and Engineer), in a long speech, outlined the history of the Guernsey telephone undertaking, which, largely owing to the initiative of Gen. Mainguy, had been maintained independently of either the Post Office or the National Telephone Co. for the last fifteen years, and now numbered 2,110 circuits, or one to every twenty inhabitants, having thus the best telephoned area in the United Kingdom. The gift, which we illustrate here, was an imitation of a hand-combination telephone set, made by J. McMillan & Co. (Clun House, Surrey St., Strand), containing a clock, an aneroid, and a thermometer, made by Negratti & Zambra.

We learn that the Baudot system of multiplex telegraphy

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published December 24th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

27,747/12. **Illumination of Studios, &c.** A. C. and M. A. ADAMS. Illumination for photographic or painting purposes is obtained by arc lamps arranged behind a composite filter screen of white and tinted layers of open net-like fabric. It is arranged that some light passes direct, while some is reflected from parts of the screen. This is sinuously arranged. Four figures.

28,046/12. **Ovens and Grills.** A. F. BERRY. A heating element is in contact with a doubly inclined and fluted metal plate, on which the viand to be cooked is placed, while above this is a second element and a movable arm having a universal joint, so that searing may be rapidly effected by moving the element laterally or by tilting. Four figures.

28,108/12. **Rotary Converters.** PHOENIX DYNAMO MFG. CO. and R. POHL. The pressure on the D.C. side is adjustable by the use of a booster, which is also used as a starting motor. The booster is arranged on the shaft of the rotary, and has a laminated field structure without salient poles, the windings of which serve not only as exciting windings, but as secondary windings during starting, so as to increase the torque. This winding is of the two- or three-phase type, and is connected to a regulating resistance through suitable switches so as to perform either of the functions mentioned. Three figures.

29,750/12. **Heating Element.** H. J. DOWSING and D. HUNTLEY. Filaments of quartz are formed into bundles, and over the exterior surface is wound the resistor. To facilitate the formation of the quartz filaments into bundles of the required shape, a gum or other binding material, which may afterwards be burnt off, dissolved, or removed in some other way, is used. A number of the quartz bundles may be arranged side by side, and the resistor wound or woven alternately over and under, so that a single mat-like element of a flexible nature, which is a good conductor of heat and diathermal results. As the quartz bundles are not liable to fracture they may be used to give continuous contact between the electrical element and any flat or curved surface, e.g., a hot plate. Seven figures.

2,009/13. **Measuring Capacity in Telephone Circuits.** G. A. CAMPBELL, O. B. BLACKWELL, and E. H. COLPITTS (Western Elec. Co.). To measure capacity unbalances in a telephonic phantom circuit, a testing set, consisting of a variable capacity and means for connecting it in different combinations between an element of one of the pairs of elements of the phantom circuit, and both elements of another of the pairs, and means for determining when the variation in the connected capacity has equalised the capacity between the elements, as well as means for indicating the amount of the equalising capacity, is used. Five figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** JOHNSON (*F.I.A.T. Fabbrica Italiana Automobili Torino and Soc. Anon. Officine Galileo*) [Portable light-projecting apparatus] 14,710/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** WAKEHAM [Casing: especially for ships' panning, partitions, &c.] 25,539/12; SOC. INTERNATIONALE DE LUMIERE FROIDE (PROCÉDÉS DUSSAUD) [Lighting system] 28,229/12; LODGE and LODGE [H.P. insulators] 29,269/12; FRIEDR. KRUPP A.-G. (GRUSONWERK) [Machines for taping cables] 9,575/13; HUME [Machine for manufacturing conduits, &c.] 21,626/13.

**Dynamos, Motors and Transformers:** HEYLAND [Diminishing the electromotive forces induced in the commutation zone of commutator machines] 29,409/12, CROMPTON & CO. and BURGE [Polyphase synchronous motors] 15,523/13; ASHDOWN and ROBINSON [Interchangeable A.C.-D.C. motor] 19,395/13.

**Heating and Cooking:** MC. COURT and RADIANT HEATING [Heating of fluids] 22,305/12; HULBERT [Controlling heating apparatus] 28,409/12.

**Ignition:** RUSHMORE [Starting motors] 29,932/12; FREIBERG and PETZSCHE [Sparking plugs] 20,361/13.

**Incandescent Lamps:** SKAUPY [Vacuum lighting tubes] 29,104/12 and 14,591/13; VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. and BRONNERT [Manufacture of filaments from copper cellulose solution] 4,922/13; DEUTSCHE GASGLÜHLICHT A.-G. (AUERGES) [Production of bulbs with reflectors] 15,360/13; WOLFRAM-LAMPEN A.-G., 15,824/13.

**Instruments and Meters:** B.T.-H. Co. and YOUNG [Mercury motor meters] 1,600/13; CHILDS and REASON MFG. CO. [Electrolytic meters] 14,310/13.

**Switchgear, Fuses and Fittings:** LEVEQUE-PETIT [Switches] 9,179/13.

**Telephony and Telegraphy:** MARCONI [Wireless telegraph transmitters] 28,865/12; CLAUSSEN [Sound-reproducing apparatus] 3,534/13; MOLL and KUSCHEWITZ [Protection for telephone and telegraph wires against inductive action] 11,208/13; LYONS [Selective telegraph receivers] 15,097/13.

**Traction:** SOC. S.T.A.R. (SYSTÈME DE TRACTION AUTO-RÉGULATEUR) [Electric machines] 27,923/12; ROBINSON [Automatic speed regulation] 28,327/12; SANDBERG and HASENOHRL [Preventing collision of trains] 11,839/13; EVANS and J. B. SAUNDERS & CO. [Railway electric signals] 20,318/13.

**Miscellaneous:** WEINTRAUB and RUSH [Refractory materials] 20,348/12; NOURNEY [Luminous advertisements] 28,350/12; NICHOLLS [Illuminated signs] 29,995/12; FRANCHIMONT and YSEBOODT [Remote controlled signalling apparatus] 30,092/12; WOLF [Miners' safety lamps] 6,408/13; KEEN [Combined moving target and automatic indicator] 8,603/13; SANDBERG [Automatic clock winding] 11,512/13; YARROW [Synchronising arrangements for facilitating the coupling of rotating shafts] 13,080/13; GREEN [Vacuum tubes] 14,940/13; YAI [Primary battery] 15,909/13; MALONE [Thermostatic control of ventilators] 17,621/13; CLAUDE [Illuminating and advertising devices] 19,439/13; RABBIDGE [Absorbents for dry batteries] 19,783/13.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** SIEMENS-SCHUCKERT [Relay arrangements for the automatic control of circuits] 27,824/13.

**Electrometallurgy and Electrochemistry:** CLEMM [Electrolysis of alkali chlorides] 21,462/13; HIORTH [Induction furnaces] 22,159/13; RENNERFELT [Furnaces] 24,850/13.

**Heating:** DE KOK [Water heaters] 16,214/13

**Ignition:** UNIONWERK MEA GES. [Contact breakers for magnetos] 23,739/13.

**Telephony:** SIEMENS & HALSKE [Circuits] 27,646/13.

**Traction:** LAUTENBACHER [Tightening and separating trolley wire sections] 25,951/13.

**Miscellaneous:** DE MELLO [Batteries] 24,471/13; LINDEMANN [Regulating the gas pressure in Röntgen and vacuum tubes, &c.] 27,599/13.

### Opposition Entered to Grant of Patent

22,548/12. **Drawn Tungsten Filaments.** POPE'S ELEC. LAMP CO. (*C. Trenzen, Germany*). Opposition to the grant of this patent (ELECTRICAL ENGINEERING, Nov. 6th, p. 620, Vol. IX.) has been entered.

### Grant of Patent Allowed

19,014/12. **Selective Wireless.** F. JAMIESON. The Comptroller has allowed the grant of this patent in spite of opposition (ELECTRICAL ENGINEERING, May 8th, 1913, p. 264, and July 3rd, 1913, p. 398, Vol. IX.).

### Appeal from Comptroller's Decision

3,878/12. **Shaft Rotation Indicators.** P. R. KEEPIE and H. M. R. MADDICK. The Comptroller's decision to allow the grant of this patent in spite of opposition is appealed against.

### Expiring Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** SIEMENS DYNAMO WORKS (*Siemens-Schuckert*) [Regulation of alternators running in parallel] 18,715/08.

**Instruments and Meters:** W. POWLES and E. E. MOORE [Single needle galvanometers] 20,399/06; H. B. BISHOP [Testing liquid conductivity] 19,048/08.

**Switchgear, Fuses and Fittings:** E. GARSIDE [Motor controllers] 18,965/08.

**Miscellaneous:** A. H. SCHERZER [Bascule bridges of the rolling-lift type] 20,022/07, 20,023/07, and 20,024/07.

is about to be put in commission between London and Liverpool and Glasgow. Quadruple Baudot has been worked for some time between London and Birmingham, and sextuple working is now going to be introduced. This will enable six messages to be sent simultaneously in each direction, and means an interchange of about 860 words per minute.

The Zanzibar-Mombasa cable has been restored, and the Persian lines between Borazjoon and Ahvaz were down on the 14th inst. On this day, also, the French Company announced the opening of their office at Puerto Rico, at the same rates as are in existence via Key West. This will naturally mean the loss of traffic to the West India and Panama Telegraph Co.—The Chio-Tenedos cable failed on the 15th inst., and on the 16th the French Co. had another

patient in the Paramaribo-Cayenne cable.—The French Co. are now taking traffic from S. Domingo City, La Romana and San Pedro de Macoris by wireless to Ponce, and forwarding it thence by cable.—The Sitka-Valdez cable was repaired on the 18th inst., and broke again on the 19th.—The El Arich route was down on the same day between Beyreuth and Gaza, and was restored on the 19th inst.—The Chio-Tenedos cable was working again on the 21st inst.—The Jamaica-Colon cable is still apparently interrupted.—The lines of the Indo-European Telegraph Co. were down between Tiflis and Soukhoun-Kale from the 23rd to 25th inst., and on the latter date the Sitka-Valdez cable was restored.—On the 26th inst. the Tenedos-Chio and Tenedos-Lemnos cables failed.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 13. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**IMMINGHAM DOCKS.**—We have received from the Great Central Railway Company a copy of the Immingham Tide Table for 1914. This neat booklet, which has been produced in pocket size, gives the high-water and low-water tides at Immingham for each day of the year, in addition to useful facts and figures, charges, steamship services, &c., respecting the ports of Immingham and Grimsby. Copies of the Tide Table will be sent free on application to Great Central Publicity Office, 216 Marylebone Road, London, N.W.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**DIRECT-CURRENT GENERATORS.**—A leaflet has just been issued by T. W. Broadbent, Ltd. (Victoria Electrical Works, Huddersfield), dealing with D.C. generators of sizes ranging from 100 to 500 kw. for direct coupling. The machines are listed for medium speeds, 214 to 250 r.p.m., and for high speeds, 525 to 300 r.p.m. They are guaranteed to work at the specified output continuously and for a period of one hour with an overload of 25 per cent. without injurious heating or sparking. Details of the construction and materials used are given. The company intimates its willingness to post a copy to any of our readers who care to apply for one.

### CHRISTMAS SOUVENIRS, &c.

WE have been favoured by Venner & Co. with one of the very neat little silver toothpicks which they are presenting to their friends. We are asked to state that they have sent these out to all their usual friends, and have practically exhausted the stock, but if any of the usual recipients have not received one, the firm will be glad if they will let them know. Some extremely humorous instructions accompany the apparatus.

A nickelled two-bladed pocket-knife comes with the greetings of the Sun Electrical Co., who state that if any of their customers and friends have not received one, the post office must be blamed. They add that since issuing these knives they have found that certain of their customers hold superstitious beliefs regarding the acceptance of knives, and have accordingly presented them in exchange with a small coin. Should any applicant prefer to be on the safe side and act likewise, they shall be very pleased to see that the funds of the Electrical Trades Benevolent Institution are duly credited with the amounts.

An attractive pocket diary in a substantial case of grey leather has been sent us from Switchgear & Cowans, Ltd. The diary is in convenient form, containing much useful information and a few selected prices of standard items of the firm's manufacture are given under the front cover. The firm have a limited number still to dispose of, and our readers are invited to apply for them.

A very striking design of daily tear-off office calendar is being sent out by Pope's Electric Lamp Co.

The Electric Construction Co., Ltd., accompany their good wishes this season by a very neat calendar and diary in a leather case of suitable size for the waistcoat pocket.

The well-known real red heat show-card design, with a girl,

a cat, and a piece of toast warming themselves by a Bastian electric radiator, is reproduced on a calendar which we have received with the compliments of Mr. C. O. Bastian.

The Electric Supply Publicity Committee have issued an attractive calendar illustrating some of the uses of electricity for the use of supply companies and local authorities.

We have received a particularly clearly printed monthly tear-off Calendar from the Victa Electrical Co., of Battersea.

Alfred Graham & Co. have sent us a copy of a neat little pocket-book of speed and tide tables for 1914 for the principal seaports in the United Kingdom, containing also a good deal of nautical, electrical, and engineering information.

### THE LIGHTING OF A LONDON PRINTING WORKS

ON several occasions the lighting of printing works has been discussed in our columns; recently the printing works of the Boots Pure Drug Co., Ltd., were cited as an example of up-to-date methods in the illumination of such places, carried out by the British Thomson-Houston Co., Ltd. (77 Upper Thames Street, E.C.). The Company have lately carried out an installation on similar lines at the works of Messrs. Gee & Co., printers and publishers, of Phipps Lane,

FIG. 1.—COMPOSING ROOM.

E.C. Local lighting is employed in the machine room, the installation consisting of a single 60-watt Mazda lamp and Mazdalux reflector suspended 9 ft. from the ground over each of the seven machines. In one composing room ten units, 8 ft. from the floor, each consisting of a 60-watt Mazda lamp and Mazdalux reflector, provide good general illumination throughout the room, and are so arranged as to give a much stronger local illumination on the composing desks and tables. Another small composing room is lighted by thirteen 40-watt Mazda lamps and Mazdalux reflectors, fixed 2 ft. above the top of the composing desks. Ten 80-watt and seven 40-watt Mazda lamps, equipped with Mazdalux reflectors, are used

## What the Public Wants.

### CONSUMERS' BOOKLETS

ON

### THE USES OF ELECTRICITY

describing in simple language the various applications of electricity.

Many thousands of these booklets have been sent to consumers and prospective consumers by electricity works and wiring contractors.

**Part I. ELECTRIC LIGHTING** (including the lighting of Private Houses, Tradesmen's Shops, Shop Front Lighting, Electric Signs, &c.). Price **One Penny** (By post, 2d.); 7s. 6d. per 100 (By post, 8s.); £3 3s. per 1,000 (Carriage forward).

**Part II. ELECTRIC COOKING AND HEATING, and other Domestic Uses of Electricity** (Electric Irons, Electric Fans, Vacuum Cleaners, &c.). Price **Two Pence** (By post, 3d.); 11s. 6d. per 100 (By post, 12s.); £5 5s. per 1,000 (Carriage forward).

**Part III. WORKS DRIVING** Price **Two Pence** (By post, 3d.); 11s. 6d. per 100 (By post, 12s.); £5 5s. per 1,000 (Carriage forward).

THE KILOWATT PUBLISHING CO., LTD.

TEMPLE CHAMBERS, LONDON, E.C.

in the folding and binding rooms respectively. The various offices, warehouses, stores, &c., are lighted throughout by Mazda lamps, equipped in some cases with prismatic glass reflectors, and in others with enamelled iron shades. The installation is a good example of modern industrial lighting, in which adequate illumination is given at all necessary points, while at the same time glare is avoided by the use of properly designed reflectors to hood the lamps. In conclusion, it should

FIG. 2.—FOLDING ROOM.

be stated that the experience and services of the British Thomson-Houston Co.'s illuminating engineers are freely at the disposal of anyone interested in the lighting of printing works.

### A NEW MOTOR CONTROLLER

FOR the purpose of controlling small cranes and for installing in situations where space is at a premium, the General Electric Co., Ltd. (of Witton, and 67 Queen Victoria Street, E.C., &c.), have designed a form of controller in which the resistances are contained inside the controller case itself. In general, it may be said that this controller is a miniature edition of the larger sizes of G.E.C. controller, with the exception that it inherently includes the resistances. As will be seen from the accompanying illustrations, the controller is circular in plan view, and the resistances are fixed inside

With resistances.

Without resistances.

NEW DESIGNS OF G.E.C. CONTROLLERS.

the controller casing well away from the arcing parts. They are carried on insulating tubes threaded on vertical steel conduits which are insulated from the case by means of porcelain insulators. If desired, the resistances can be

supplied separately, in which case they are mounted in a separate protected frame, which can be placed any distance away from the controller. The design of the controller, however, is such that the inclusion of the resistances inside the controller is thoroughly satisfactory.

## THE ELECTRICAL ENGINEERS' DIARY

THE high standard of the "Electrical Engineers' Diary," published by Messrs. S. Davis & Co., 30 and 31 St. Swinham's Lane, E.C., is well maintained in the 1914 edition, a copy of which is just to hand. It contains much valuable technical information on the generation and application of electrical energy in all branches, and there are also, as usual, the very useful list of London streets in which mains are laid, and the list of electrical supply authorities in the United Kingdom. Approximate figures are given of the numbers of electricity and gas consumers, and the moral is pointed that an extensive advertising campaign is needed in the electrical industry to bring home to the public the extraordinary advantages, conveniences and economies of electricity. In individual districts, of course, this policy is already being carried out, but for the general good of the industry that co-operative effort of which so much is heard from time to time would be a profitable one to all concerned.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Basingstoke.**—A Local Government Board inquiry has been held concerning a loan of £14,000 in connection with the Council's electric lighting scheme.

**Dundee.**—One 5,000-kw. turbo-alternator; condensing plant; one 750-kw. rotary-converter with transformer. (See advt.)

**Haslingden.**—A loan of £700 has been sanctioned for sub-station plant.

**Manchester.**—Water-coolers for Stuart Street generating station. Chief Electrical Engineer. January 16th. (See advertisement on another page.)

**Mansfield.**—The Electrical Engineer has been instructed to report with regard to an extension of the generating plant.

**Rathmines.**—A Local Government Board inquiry has been held regarding a loan of £12,160 for electricity works extensions.

**Southampton: Meters, &c.**—Borough Electrical Engineer, January 12th. (See advertisement on another page.)

**Stoke-on-Trent.**—The Engineer has been instructed to report as to the total cost of mains, posts, and lamps for street lighting by means of flame arc lamps in the Stoke area.

**Swansea.**—One or two years' supply of motors and starting switches is required. Borough Electrical Engineer.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Camborne.**—New school.

**Doncaster.**—Cinematograph theatre in High Street. Architect, E. H. Walker.

**East Ham.**—New school in Dersingham Avenue.

**Glasgow.**—Electric lighting at police buildings in Albert Street, Govan. Town Clerk.

**London.**—318 lights at Vernon Square school, Finsbury, and 258 lights at Ranelagh Road school, Pimlico. (See advertisement on another page.)

**Manchester.**—120 working men's houses.

**Mansfield.**—Cinematograph theatre, Skerry Hill.

**Mexborough.**—New baths.

**Mossley.**—New baths.

**Northallerton.**—Cinematograph theatre.

**St. Albans.**—Electric lighting of infirmary. Clerk to Guardians, Chequer Street.

**Salford.**—Tuberculosis sanatorium. Town Clerk.

**Southend.**—131 houses; also a cinematograph theatre in Leigh.

**Southport.**—Rebuilding of municipal offices (£6,000).

**Warrington.**—New school.

**Watford.**—Additions to infirmary.

## Miscellaneous

**Australia.**—Copies of specifications for a large number of materials, including cable and electric clocks, for the Australian Postmaster-General's Department, may be seen at 73 Basinghall Street, E.C.

**Birmingham.**—Twelve months' supply of electrical sundries for the Tramways Department. General Manager. January 26th.

**Haslingden.**—A loan of £700 for overhead tramway equipment has been sanctioned.

**Nelson.**—After considering the merits of motor-buses and trolley-buses, the Tramways Committee strongly favours the latter, and a scheme will be placed before the Council at an early date.

## APPOINTMENTS AND PERSONAL NOTES

A recommendation of the Dundalk Electricity Committee to appoint Mr. J. M'Entee, of Belfast, Assistant Electrical Engineer, at a salary of £100 a year, brought forth some somewhat startling comments from one of the councillors. This gentleman, Councillor J. M. Johnson, objected to the appointment, and added that although the present Borough Electrical Engineer to the Council was being paid £250 a year, a fully qualified man could be obtained for £100 per annum. Fortunately, however, he was not allowed to have his own way, and the appointment of the Assistant Engineer was agreed to.

On the 20th inst., Mr. J. W. Beauchamp, Engineer and Manager of the West Ham Corporation Electric Supply, presented Mr. W. T. Hellaby, late Superintendent of the Representatives' Department, with a handsome marble clock on behalf of the staff and employees, on the occasion of his leaving to take up an appointment as Assistant Sales Manager for the Sunderland Electricity Undertaking, and in the evening a farewell dinner was given to Mr. Hellaby at Frascati's Restaurant, presided over by Mr. F. Farndon, Sales Manager of the West Ham Corporation Electricity Undertaking.

The estate of the late Sir William Preece, K.C.B., F.R.S., has been valued at £32,320.

The Dawlish U.D.C. requires an official for testing the illuminating power, from time to time, of the public electric lamps. Applications to the Town Clerk by January 6th, stating terms.

A sub-station charge engineer is required by the Bristol Corporation Electricity Department. (See advertisement on another page.)

**Gas Companies and Electricity Supply.**—Quite a number of gas companies are applying to Parliament next session for powers to supply electrical energy within their districts. Among them may be mentioned the gas companies of Deal and Walmer, Stone, Lurgan, Leyland, Hightown, Brentford, and a combined scheme for Blackrock, Kingstown and Dalkey by the Alliance & Dublin Gas Co. In connection with the latter there was a hard fight last session between the gas company and a local electricity company which was granted a Lighting Order for Kingstown. This, however, was subsequently withdrawn by the Government, much to the dissatisfaction of the promoters. The reason for the withdrawal of this particular Order was, we believe, in order to save the large number of other Orders contained in the same Confirmation Bill, which would have been jeopardised had the opposition to the Kingstown Order been persisted in at the third reading stage.

**Water Softening Plant.**—An impending amalgamation is announced between the well-known firms of water-softening plant manufacturers of Lassen & Hjort, Ltd., and Water Softeners, Ltd., who will henceforth carry on business under the title of United Water Softeners, Ltd. Lassen & Hjort are the patentees of a lime and soda system, while Water Softeners, Ltd., recently introduced the "Permutit" regenerative system. By means of combinations of the two systems a much greater range of conditions can be met than could be with either singly. The management of the new company will be in the same hands as was that of the original concerns, and pending the acquisition of larger offices, the business will be carried on at the existing offices of the two concerns jointly.

## SERIOUS SUPPLY INTERRUPTION AT EASTBOURNE

ON Monday last week a serious interruption to the supply of electricity in Eastbourne occurred. A fault developed in the high-tension cable supplying an outlying district, which blew the fuses in a cast-iron section pillar. When these fuses were replaced, practically the whole of the switchboard in the pillar was blown to pieces, and a very bad short was caused on two large feeders. One of these broke down absolutely and burnt the other, which was lying close to it. This was followed by the blowing of all the high-tension and low-tension fuses of the other feeders in the neighbourhood which were coupled to the network, so that, in addition to the two circuits in question, the lights were out in the business portion of the town until the faulty feeders could be isolated and the fuses replaced on the unaffected cables. The interruption to the supply lasted several hours, and caused a great deal of inconvenience and indignation in the town, especially as there had been an interruption, of less serious nature, however, on the preceding Saturday. Mr. J. K. Brydges, the Borough Electrical Engineer, has, unfortunately, been away from duty for some time owing to serious blood poisoning in the left hand, but we are informed that the Assistant Electrical Engineer, Mr. Herbert Bowlan, who was in charge, did all in his power to cut out the faults and restore supply as quickly as possible.

## LOCAL NOTES

**Chiswick: Purchase of Electricity Undertaking.**—There has been a good deal of opposition and discussion in the Council with regard to the bill deposited for next session, dealing with the purchase of the local electric supply company, and the advocates of the purchase in order to pin the Council down to a definite line of action, have been successful in getting passed a resolution to the effect that the Council will itself work the undertaking, and will not lease it after purchase.

**Dublin: Street Lighting.**—The City Electrical Engineer, after a little difficulty, induced two firms, viz., the General Electric Co. and Johnson & Phillips, to give a free trial of a full circuit of arc lamps for street-lighting purposes, numbering twenty-two. This trial was started early in 1913, and Mr. Mark Ruddle now recommends that the lamps should be taken over from both firms. Further trials with arc lamps have been postponed pending the availability of the new half-watt metal-filament lamps.

**Harwich: Electric Lighting.**—Acting under advice from Mr. Haydn T. Harrison, the Council has decided to promote an electric lighting provisional order.

**Hinckley: Electric Lighting.**—As previously announced in these columns, the Urban District Council has agreed with the Midland Electric Light & Power Co. with regard to an electric lighting order, but the Rural District Council has decided to oppose before the Board of Trade.

**Horsham: Electricity Works Pupilage.**—The Council is offering a pupilage at the electricity works free of premium for three years to sons of ratepayers resident in the district since January 1st, 1912. The age-limit has been fixed between 14½ to 17 years.

**Lurgan: Electric Lighting.**—The proposed municipal electric lighting scheme is arousing a good deal of interest, and a deputation has waited upon the Council urging, in preference, the purchase of the local gas company.

**Stafford: New Tariff.**—The Council has decided to allow consumers using lamps for external lighting at 3d. per unit to use an equal quantity of current for lamps for internal lighting at the same charge. When the quantity used inside the premises exceeds that used for external lighting, the ordinary tariff of 5d. will apply. This arrangement only applies to consumers using not less than 1,000 units per quarter for external lighting.

**West Bridgford: Electric Supply.**—After succeeding in getting the Derbyshire and Notts Power Co. to cut this district out of their Parliamentary Bill, the Council has after all decided not to proceed with its application for an electric lighting provisional order.

**Electric Lighting Provisional Order Applications.**—Fifty-one applications have been made to the Board of Trade for electric lighting provisional orders.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £68 5s. to £68 15s. (Last week, £66 5s. to £66 15s.)

**Branch Office.**—George Ellison (Warstone Lane, Birmingham) has opened a branch office at 4 Cannon Street, Manchester, to deal with the Lancashire and Yorkshire business, under the management of Mr. W. A. Kirkham. It is requested that clients in these two counties will forward their inquiries to the branch office.

**Bankruptcies.**—The public examination of Charles Blake, trading as the Bilston Electrical Co., 4 Church Street, Bilston, will take place at the County Court, Wolverhampton, on January 21st, at 2.30 p.m.

**Partnership.**—Mr. H. G. W. Haslett, who has been connected with the electrical trade for the last fifteen years, a considerable portion of the time being with Messrs. Krupka & Jacoby, Ltd., informs us that he has entered into partnership with the well-established business of Messrs. Ralph H. Haylock & Son, Mechanical and Electrical Engineers, 63 Queen Victoria Street, E.C.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**A.E.G.**—The past financial year has been attended by the most successful results of any within the 30 years' history of the company, particularly as regards the turnover and orders received. After deducting debenture interest, there is a net profit of 28,904,483 marks, and after payment of a 14 per cent. dividend, 1,000,000 marks have been set aside for the reserve fund, 15,000,000 marks for armament tax, 1,000,000 marks has been written off new buildings, 1,200,000 marks distributed as bonuses to employees, and 1,000,000 paid into the benevolent fund. The company is erecting a power station in the Bitterfeld coal district, which is intended to serve as a model for very large generating plants. The idea is to utilise this station for the supply of electrical energy at exceptionally cheap rates to Greater Berlin. The company's operations are particularly active in the Russian Empire.

**Holophane.**—At the annual meeting on Tuesday, it was reported that although the Company's business has shown a substantial increase during the past year, the net sales amounting to 50 per cent. over those of the previous year, the Company has suffered considerably from the effects of litigation both in this country and America following disputes concerning contracts. Serious efforts are being made to reduce manufacturing costs owing to competition from new lines of cheaper white glassware now coming on the market, and in this connection land has been purchased near Paris for the erection of a new factory. A dividend at the rate of 7 per cent. on the preference shares is to be paid, clearing off the preference dividend up to June 30th last.

**The Electrical Engineers' Ball, 1914.**—Notwithstanding the increase of engagements which make their appeal to the members of the electrical profession and industry, the Electrical Engineers' Ball, which is to be held at the Hotel Cecil on Friday, February 20th, is likely to be as great a success as usual. The following are the members of the Committee:—H. Alabaster, A. Bruce Anderson, F. Bailey, O. H. Baldwin, R. Belfield, H. H. Berry, W. W. Blunt, J. H. Bowden, D. A. Brown, Leonard Byng, T. O. Callender, C. S. Colton, F. R. Davenport, Sydney Dobson, T. C. Elder, S. Z. de Ferranti, E. J. Fox, E. Garcke, T. E. Gatehouse, K. Geipel, Wm. Geipel, Jas. Gray, R. Kaye Gray, A. E. Hadley, F. B. O. Hawes, Charles Hill, J. S. Highfield, H. Hirst, Col. H. Capel Holden, J. P. Hooper, C. E. Hunter, J. E. Kingsbury, H. M. Leaf, W. S. Lonsdale, H. T. S. MacKay, W. L. Madgen, W. Lee Matthews, W. M. Mordey, P. V. McMahon, Lee Murray, F. H. Nalder, E. A. Nash, Major O'Meara, Hugh A. Pearson, M. J. Railing, Martin F. Roberts, Leonard L. Robinson, J. H. Rosenthal, P. F. Rowell, W. Rutherford, Sydney Sharp, J. Shepherd, Alex. Siemens, A. M. Sillar, H. Scholey, Frederic Smith, C. P. Sparks, J. J. Steinitz, G. Sutton, C. D. Taite, J. Taylor, Godfrey M. C. Taylor, R. J. Wallis-Jones, F. W. Willcox, Prof. E. Wilson, F.R.S., C. H. Wordingham. The Executive Committee is composed of O. H. Baldwin, E. J. Fox, W. L. Madgen, P. V. McMahon, J. Shepherd, R. J. Wallis-Jones, and C. H. Wordingham. Messrs. H. Alabaster and A. M. Sillar are the Hon. Secretaries, and the Hon. Treasurer is Mr. J. E. Kingsbury.

## SUMMARY

NEGOTIATIONS having been broken off between the London Electrical Masters' Association and the Electrical Trades Union, an effort is now being made to deal with the conditions of wiremen's employment independently of the Union. (Page 16.)

ELECTRICITY is used even more extensively than usual in this year's Drury Lane pantomime. (Page 17.)

We give the terms of the clause proposed by the North Metropolitan Electric Power Supply Co. for prohibiting strikes of its employees. (Page 18.)

TESTS on a 100-kw. mercury-vapour rectifier delivering direct current at 350 volts from a three-phase 50-cycle supply are described. The efficiency is over 90 per cent. A steel construction is adopted, and outputs up to 1,200 kw. have been reached by this means. (Page 19.)

A DESCRIPTION of the machine known as the phase-balancer is given. This consists of a synchronous condenser with a series booster. (Page 19.)

We refer to a number of applications to Parliament by Corporations asking powers to hire out motors, &c., leaving the contractors the work of fitting up consumers' premises. (Page 19.)

SOME particulars of a storage battery in use with counter e.m.f. cells in America are given. (Page 20.)

AN appeal has been lodged against the Comptroller's refusal to grant patents on three applications by the Julius Pintsch A.-G. The patents relate to ductile filaments of tungsten alloys. (Page 20.)

A CURIOUS fault on a crane circuit is discussed in our Questions and Answers columns. (Page 20.)

AN important conference was held at the Mansion House on Monday in order to secure the co-operation of employers in the new scheme of evening instruction inaugurated by the L.C.C. (Page 21.)

THERE was published by the Patent Office last week a specification by G. Marconi for rotary disc dischargers used in a tuned circuit coupled to the antenna through an intermediate tuned circuit. Another patent relates to starting up polyphase synchronous motors. This is by Crompton and Co. and H. Burge. (Page 23.)

THE Earl's Court-Willesden section of the London and North-Western Railway will soon be running electrically, and progress is being made with the conversion of the other lines and with the Stonebridge Park generating station.—The Lancashire and Yorkshire Railway Co. has decided to convert its line from Manchester to Bury to electric traction.—The Dolter surface contact system on the Hastings sea front has been condemned by the Board of Trade.—An important scheme for running tramways under the River Mersey has been prepared by the Liverpool Tramway Manager. (Page 24.)

THE Hull Corporation has now decided to purchase the Post Office telephone system in that town.—The trawlers using the Port of Hull are to be equipped with wireless.—Some particulars of the aerial tower at the Goldschmidt wireless station at Tuckerton are given. (Page 24.)

SOME crystal glass fittings are illustrated, and a new ignition battery, an electric grinder and some new automobile lighting switchboards are described. (Pages 25 and 26.)

EXPENDITURE upon new plant, mains, services, &c., is contemplated as follows:—Belfast (£15,000); Rotherham (£15,956); Rhyl and York.—Generating plant, rotary converters, &c., are required at Ipswich; a 5,000 kw. turbo-generator at Bradford; and Diesel engine-driven sets in New Zealand.—New tramcars are required at Accrington; miscellaneous stores at Plymouth; rotary converters by the N.S.W. Railways Department, and a considerable expenditure upon tramway extensions at South Shields is being provided for. (Page 27.)

THE Hove Corporation has agreed to a price for the purchase of the local electric lighting undertaking.—We explain a supply interruption at Dundee on Christmas Eve.—An interesting supply scheme for small villages has been inaugurated in Cheshire.—The Bolton new power station is approaching completion. (Page 28.)

**The Portsmouth Fire.**—At the inquiry into the circumstances of the fatal fire at Portsmouth Dockyard, Mr. A. G. Hiscock, the Corporation mains engineer, said that the fact that the fuses controlling the supply of the northern and southern portions of the building remained intact, and that the electrical system had nothing to do with the fire. Other witnesses described the conditions as favourable to spontaneous combustion.

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JANUARY 8TH.

*Institution of Electrical Engineers.*

8 p.m. "British Practice in the Construction of High-Tension Overhead Transmission Lines," by B. Welbourn.

SATURDAY, JANUARY 10TH.

*Birmingham and District Electric Club.*

7 p.m. At Swan Hotel, New Street. Presidential Address by Mr. W. Y. Anderson.

MONDAY, JANUARY 12TH.

*Institution of Post Office Electrical Engineers.*

6 p.m. At Institution of Electrical Engineers, Victoria Embankment. "The Loading of Aerial Lines and the Electrical Constants of Loaded Circuits," by J. G. Hill.

*Institution of Electrical Engineers: Newcastle Section.*

8 p.m. At Armstrong College. "Inductance and Induction Coils in Industrial Work," by E. P. Hollis.

TUESDAY, JANUARY 13TH.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At University. "British Practice in the Construction of High-Tension Overhead Transmission Lines," by B. Welbourn.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. At 207 Bath Street, Glasgow. "The Employment of Power in H.M. Post Office," by H. C. Gunton.

WEDNESDAY, JANUARY 14TH.

*Royal Society of Arts.*

5 p.m. Juvenile Lecture II. "Electric Vibrations and Wireless Telegraphy," by R. P. Howgrave-Graham.

*Institution of Electrical Engineers: Yorkshire Section.*

7 p.m. At Philosophical Hall, Leeds.

### The London Electrical Engineers.

(TO-DAY) THURSDAY, JANUARY 8TH.—C. Company. Technical Instruction, 7 to 10 p.m.

FRIDAY, JANUARY 9TH.—D. Company. Technical Instruction, 7.30 to 9.30 p.m. Special Class on Crossley Engine, 7 to 8 p.m.

SATURDAY, JANUARY 10TH.—Headquarters open from 10 a.m. till noon.

MONDAY, JANUARY 12TH.—A. Company. Technical Instruction, 7 to 10 p.m.

TUESDAY, JANUARY 13TH.—B. Company. Technical Instruction, 7 to 10 p.m.

WEDNESDAY, JANUARY 14TH.—Recruits only. Infantry Drill and Technical Instruction, 7 to 10 p.m.

THURSDAY, JANUARY 15TH.—C. Company. Technical Instruction, 7 to 10 p.m.

FRIDAY, DECEMBER 16TH.—D. Company. Special Class on Crossley Engine and Technical Instruction, 7 to 9.30 p.m.

SATURDAY, DECEMBER 17TH.—Headquarters open from 10 a.m. till 12 noon.

## THREATENED STRIKE OF ELECTRICAL WORKERS

### Negotiations broken off

MATTERS have been proceeding quietly since the reply of the Electrical Trades Union to the London Electrical Masters' Association, given on page 717 of our issue for December 18th, 1913, but the present position is that negotiations between the Masters' Association and the Union have been broken off. In an endeavour, however, to arrive at some uniformity in the minimum rates of wages and terms of employment in the electrical trade, which it is now realised has reached an acute stage, the Committee of the London Electrical Masters' Association has sent out an invitation to all employers of electrical workmen, union and non-union, asking them to arrange that one delegate for every twenty of their employees should attend a meeting to be held at Caxton Hall on January 27th, in order that the position can be fully explained and discussed. At this meeting it is suggested that the men, union and non-union, should appoint a committee to confer with the Committee of the London Electrical Masters' Association, and endeavour to agree upon a recognised minimum rate of wages for each grade, terms of employment, &c. At the same time the London Electrical Masters' Association has sent out the poster reproduced below, which, it is suggested, employers of electrical workmen should fix in their works, announcing this meeting.

The breaking-off of negotiations has been due to the refusal of the Electrical Trades Union to meet the London Electrical Masters' Association with the understanding that the rights of non-union men should be recognised; it is on this point that the present climax has arisen. It is true that during the past three or four weeks there have been a number of accessions to the ranks of union workmen, owing to promises that the Union will make efforts to increase their wages, but there is absolutely no doubt that by far the greater proportion of the wiremen and other electrical workers in London do not belong to the Union, and that comparatively few of the better and more able class of wiremen have joined it. Obviously the masters must study the interests of these men. The action of the London Electrical Masters' Association should particularly appeal to them, inasmuch as the fixing of an increased minimum wage will undoubtedly be detrimental to the better class of workers. If masters are compelled to pay higher rates to wiremen generally, and if

the men with less experience and ability are to be paid wages as high as the more efficient workmen are already earning, the increase in the weekly wages bill will be such that the masters will be forced to adhere to the Trade Union minimum even in the case of a great number of their better-class workmen, who, under present conditions, receive considerably more than the existing Trade Union rate. The prospects of advance of the cleverer and more energetic men among the younger workers would also be materially diminished. In fact, the interests of the masters and of all the wiremen, with the exception of a few of the less efficient among them who belong to the Union, are absolutely identical.

The action of the masters demonstrates beyond doubt their desire to put the whole position upon a satisfactory and permanent basis. That conditions at present are chaotic cannot be denied, and the foolish state to which things have come is well shown by an incident which happened quite recently in the case of a large installation. Here a firm of electrical wiring contractors had secured the contract for the

## NOTICE.

THE LONDON ELECTRICAL MASTERS ASSOCIATION being desirous of improving the status of all electrical Workers, (whether connected with any organisation or not), and the general terms of employment and wages, desire you to send a delegate or delegates to meet them, each delegate representing about 20 men.

At the Meeting which will be held on Tuesday, Jan. 27, at 8 p.m. at Caxton Hall all matters with reference to employment will be openly discussed, when it is hoped that a Committee of the Men and the London Electrical Masters Association will be formed to draw up a code of Working Rules, fix a scale of Minimum Wages, and settle other terms of employment.

The Delegates to be ELECTRICAL WORKERS and the names and addresses of those selected should be forwarded through the employer to Mr. L. G. TATE, Secretary of the London Electrical Masters Association, 20 Bechlersbury, E.C. not later than Monday, January 19th, when admission tickets for the meeting will be forwarded.

electrical installation, but a large amount of temporary lighting was required during the course of the building operations. The contractors for the building, it so happened, have a very efficient wiring department of their own, and employ both union and non-union men. With a view to expediting the building operations, a gang of wiremen, who happened to be non-union men, was sent by the builders to fit up the temporary lighting, but no sooner had they appeared on the job than the men of the electrical contractors for the permanent installation intimated that unless union men were sent they would cease work. The exigencies of time prevented the matter being fought, and the builders being in the fortunate position of having union men to send, did so, and the incident closed, but a lasting solution must be found for these irritating and petty actions on the part of union workers if the industry is to be managed on anything approaching commercial lines.

It is probably common knowledge now that the London Master Builders' Association is also dealing with this question of sectional "sympathetic" strikes, which has been brought more prominently to the fore in the building trades as a consequence of what happened at the Pearl building, and in one or two other cases round about London. Under the rules of the London Electrical Masters' Association, it is open to that body to affiliate with other bodies, but no decision has yet been come to whether they will affiliate with the London Master Builders' Association. In any case, however, it would seem probable that a cordial working understanding between the two Associations will be arrived at to deal with the present situation.

**Accident at the Westinghouse Works.**—On Monday afternoon a fatal accident occurred at the Trafford Park Works of the British Westinghouse Co., when a flywheel attached to a motor-generator in the dynamo testing department suddenly burst, hurling fragments of iron considerable distances, killing a man named Henry Spokes and injuring a dozen others. Portions of the flywheel went through the roof and were found 500 yards away. The flywheel is stated to have been 8 ft. in diameter, weighing 3 tons, and to have been running at 600 r.p.m.

## DRURY LANE PANTOMIME

ACCORDING to our daily contemporaries, every pantomime at Drury Lane excels those that have gone before, and although it is not the province of an electrical engineering journal to criticise or praise any example of the dramatic art, yet we can affirm that the effects produced by the aid of electricity have never been equal to those now shown twice every day in *The Sleeping Beauty Re-awakened*.

There are two great scenes to which attention may be specially drawn. The first is that entitled, "Beauty's Awakening," in which the Princess is discovered asleep on a gorgeous settee covered by a canopy. By the aid of Puck she dreams of all the fairy stories that have ever been invented, and by the aid of a transparent curtain and some ingenious machinery the audience is enabled to share the delight of these visions. At the beginning of the scene there is no light behind the gauze curtain, but when the lights are turned on the curtain seems to disappear, and it becomes possible for the audience to see the long procession of characters so dear to the juvenile mind. Each character rises from the stage and moves steadily upward at an angle of about 30°, either to the right or the left, and finally disappears. It looks very mysterious, but is quite simple in reality, for behind the gauze are two moving staircases very similar to those in use on the tube railways, but, of course, much smaller. Each consists of a Gandy belt with oak slats and pulleys at the top and bottom. At intervals along the belt are fixed steps, and on these the performers stand, getting on to the staircase at the lower end and off at the top, finally descending to the stage proper by fixed steps. For driving the staircase a 5-h.p. Waygood motor is employed, which actuates the pulleys through worm gearing. Each staircase measures 18 ft. in length and its upper end is 12 ft. from the stage. A substantial iron framework carries all the mechanism, including a double pole switch, cut-out, starter and motor, and merely has to be moved into place to be ready for action.

Current is conveyed to the motor by a length of flex with a plug attached, the latter fitting into a socket provided for the purpose and fixed in the stage. Each staircase accommodates about six performers at one time.

Among those who take part in these processions are some who represent fairies and carry torches which appear to flame with a bright blue light. In the head of each torch there is a small electric lamp supplied by a dry battery concealed in the handle. The space containing the lamp is covered over with gelatine and blue silk, and projecting vertically from it are other small pieces of silk supported on the extremities of spiral springs. This device is so ingenious that it is difficult to realise at even a short distance that the torch is not really burning.

The other great scene to which we have alluded is that known as the forest scene. The hero, having crossed a chasm by way of a frail rustic bridge, defeats his pursuers by cutting the bridge down with an axe. Evil spirits then set fire to the forest, and the escape of both the Princess and her lover is cut off.

At this critical time the pursuers hit upon the happy idea of felling certain trees, which, falling across the chasm, place the enemy in command of the situation, and the trees are at once utilised as bridges. Obviously it would not do for the affair to terminate thus unfortunately, and Puck therefore commands the immediate appearance of a beautiful crystal bridge, which rises from the depths of the chasm and provides the happy pair with a path to freedom. We disclose no secret when we say that the evil spirits and Puck are enabled to perform all these wonderful feats by the aid of the electrical engineer. The forest fire is most realistic, and is arranged in the following manner. In various pieces of scenery built to represent banks of earth with bracken growing on top, there are fixed some forty-eight electric fans situated so as to produce a powerful current of air in an upward direction. Just above these fans are numerous amber and red lamps arranged in four circuits. Above these, again, wire netting is stretched, and tied to it are many orange and red silk streamers. Furthermore, perforated steam pipes are hidden in the banks. At exactly the right moment the coloured lamps are brought into incandescence through dimming resistances, thus producing the effect of a fire starting and gradually burning up more fiercely. Next, the fans are started, and the up-current of air blows out the silk streamers in such a manner as to provide an excellent imitation of flames. Moreover, the

noise made by the fans heightens the illusion, and the fire appears to rage with great fierceness. The finishing touch is given by the clouds of steam emitted by the hidden pipes. Rotatory resistances are also provided, and these enable the requisite flickering effect to be obtained. In all, there are twelve of these banks, all permanently wired and provided with a separate circuit and fuse for each fan.

The trees felled to bridge the chasm also appear to burn, and they presented an interesting problem, for it was not found practicable to provide them with fans. Each is therefore provided with an iron air duct, the top of which consists of wire netting to which the silk streamers are tied. Inside there are four circuits of coloured lamps, fifty-six in each tree, and a perforated steam-pipe. The trees are hinged at their lower ends, and air is blown into them through flexible canvas ducts, the blast being provided by an Electric Ordnance blower and motor of 1½ h.p.

Leading up to the crystal bridge is a short flight of steps, which, at the beginning of the scene, is covered with a cloth, the latter being withdrawn when the bridge is brought into position. The bridge and steps are solidly constructed of angle iron, the treads, risers and floor consisting of ½-in. sheet-glass with roughed surface. Underneath are some 360 10-in. metal filament tubular lamps carried in reflectors. These lamps are brought up gradually to full brightness through special resistances. The posts and rails of the bridge are hollow, and are covered with the translucent fabric argentine. Within them are tubular lamps coloured in such a manner as to give the appearance of mother of pearl. The bridge itself is concealed beneath the stage until required, and is then raised into place by means of one of the electric lifts which constitutes the middle portion of the stage.

An interesting feature is the steam supply. Steam is raised in the theatre boiler and brought to two points on the stage. Temporary flexible connections are then made to distributors of which there are two, each having eight ways. Sub-connections run from the distributors to the points required, instantaneous couplings of an ingenious type being employed. In the forest fire scene, it is interesting to note, some 800 ft. of steam hose is made use of. For the same scene there are also 120 special stage plugs and 1,500 ft. of special stage flex capable of carrying 15 amperes. This flex was specially made for Drury Lane by Messrs. Baxter and Caunter, and is protected with an outer covering of treated hemp braiding.

The real water fountain, prominent in one of the big scenes, is actuated by an electrically driven pump.

We have described above a few of the principal effects now being employed at Drury Lane, but they give but a slight indication of the uses to which electricity is put in the pantomime. Of arc and incandescent lamps there is no end, and in one instance the former have been displaced by two 2,000-c.p. ½-watt lamps suspended in a huge cradle from the flies and invisible from the front.

There are many parts of the performance of great beauty, and the delightful colour schemes are such as to make a very vivid impression on the minds of all who witness it.

The management of Drury Lane have set themselves a difficult task if they intend to produce finer effects next year.

In concluding this article we wish to thank the management, and particularly Mr. Ernest D'Auban, the Stage Manager, and Mr. H. Mather, the Theatre Electrician, for enabling us to obtain the necessary data.

**Cable Box Explosion at Brixton.**—Last Thursday afternoon an explosion affecting four boxes connected with the L.C.C. tramway feeders occurred at Acre Lane, Brixton. Town gas had accumulated in the cable ducts, and was fired by some means unknown. There was no interruption in the supply, although two of the man-hole covers were violently blown up, and a boy walking on one of them was cut about the legs.

**Finsbury Technical College O.S.A. Magazine.**—The most recent issue of this bright periodical contains some interesting matter, largely made up of short notes relating to the doings of the Association and its members. There is a biography of Mr. E. Kilburn Scott, who was awarded the O.S.A. medal for the session 1912-13, for his Paper, "Electric Cables for Shafts in Mines," read before the London Branch of the Mining Electrical Engineers. There were six Papers submitted in the competition. We note that a dance is to be held at the Caxton Hall on Saturday, February 14th, while on Friday, March 27th, there is to be a smoking concert at the Waldorf Hotel. The issue also contains the conclusion of an article on the Dover Harbour Works by Mr. J. D. Johns, some book reviews, a photograph of Mr. Kilburn Scott, and some smart pen sketches of visitors at the annual dinner.

## PREVENTION OF STRIKES AT ELECTRICITY WORKS

### Action by North Metropolitan Power Co.

THE North Metropolitan Electric Power Supply Co. has apparently decided to take some action to provide against the possibility of a cessation of the supply in their area through a strike of their employees. The effect of the strikes of municipal workers at Liverpool in 1912, and in Leeds and Blackburn more recently, have brought to the front the need for something to be done to deal with those special classes of workmen employed by municipalities and companies supplying electricity, gas and water, the stoppage of which through strikes would be serious.

As we have pointed out on previous occasions, there already exists Section 4 of the Conspiracy and Protection of Property Act of 1875, which provides that where a person employed by a municipal authority, company or contractor upon whom is imposed by Act of Parliament the duty of supplying gas or water, breaks a contract of service, knowing, or having reasonable cause to believe, that the probable consequence of his so doing, either alone or in combination with others, will be to interrupt the supply of gas or water, he shall be liable to a fine up to £20, or three months' imprisonment with or without hard labour. In its Bill, which will come before Parliament next session, the North Metropolitan Electric Power Supply Co. has, in conjunction with the North Metropolitan Electrical Power Distribution Co., inserted the following clause, which, it will be seen, is an adaptation of the above section to the undertakings of these companies.

(1) Where any person employed by the Two Companies wilfully and maliciously breaks a contract of service with the Two Companies, knowing, or having reasonable cause to believe, that the probable consequence of his so doing, either alone or in combination with others, will be to deprive the inhabitants of a city, borough, town or place within the area of supply of the Two Companies wholly or to a great extent of their supply of electricity, he shall on conviction thereof by a court of summary jurisdiction or on indictment, as hereinafter mentioned, be liable to pay a penalty not exceeding twenty pounds, or to be imprisoned for a term not exceeding three months, with or without hard labour. The Two Companies shall cause to be posted up at the works of the Two Companies a printed copy of this section in some conspicuous place where the same may

be conveniently read by the persons employed, and as often as such copy becomes defaced, obliterated, or destroyed, shall cause it to be renewed with all reasonable dispatch.

(2) If the Two Companies make default in complying with the provisions of this section in relation to such notice as aforesaid, they shall incur on summary conviction a penalty not exceeding five pounds for every day during which such default continues, and every person who unlawfully injures, defaces, or covers up and notice so posted up as aforesaid in pursuance of this section shall be liable on summary conviction to a penalty not exceeding forty shillings.

(3) Where a person is accused before a court of summary jurisdiction of any offence made punishable by this section, and for which a penalty amounting to twenty pounds or imprisonment is imposed, the accused may, on appearing before the court of summary jurisdiction, declare that he objects to being tried for such offence by a court of summary jurisdiction, and thereupon the court of summary jurisdiction may deal with the case in all respects as if the accused were charged with an indictable offence, and not an offence punishable on summary conviction, and the offence may be prosecuted on indictment accordingly.

Section 4 of the Conspiracy and Protection of Property Act, 1875, was not, for some reason, put into effect in connection with the recent municipal strikes which affected gas and water supplies. At the same time, Parliament may consider the application of this clause to the electrical industry too large a matter to be dealt with piecemeal in individual private Bills.

In the I.M.E.A. Bill last year, a similar clause was included.

### A 100-KW. MERCURY-VAPOUR RECTIFIER

Great progress is being made in the development of the mercury-vapour rectifier for heavy outputs, and already, we are informed, the General Electric Co. of America are experimenting with a 1,000-kw. rectifier capable of delivering from 600 to 700 amperes continuously at pressures up to 2,700 volts direct-current, and even 1,400 amperes for short intervals at about 850 volts, corresponding to an output of 1,200 kw. In Germany, also, considerable progress has been made, and in the *Elektrotechnische Zeitschrift* for December 25th, Dr. K. Norden describes the standard three-phase 100-kw. model of the Allgemeine Elektrizitäts Gesellschaft, and gives the results of a test carried out by Prof. Orlich.

This rectifier, as shown in the figure, comprises a steel cylinder 3 ft. 3 in. high and 16½ in. in diameter, with a steel vessel let into the top for containing water. The cylinder forms the condensing chamber of the rectifier, and the evaporation of the water in the inner vessel keeps it from overheating. The iron anodes are in three upwardly projecting arms spaced equidistant round the lower circumference of the cylinder. The vacuum joints on the tops of these are made with concentric lead rings. The mercury cathode is contained in a vessel attached to the bottom of the cylinder in a similar manner. A vacuum pump is connected to the cylinder, and is run continuously during operation, while the water vessel has to be refilled about once every twenty-four hours. The arc is started by hand with the aid of an auxiliary electrode, and can be observed through a little mica window let into the steel cylinder.

The tests made by Prof. Orlich were carried out with three-phase current at 50 cycles, the direct-current load being

GENERAL ARRANGEMENT OF 100 KW. MERCURY VAPOUR RECTIFIER.

connected between the cathode and the neutral point of the three-phase transformer to which the rectifier was connected. No choking coil was inserted in the direct-current circuit, but the output was measured by movable coil instruments of the d'Arsonval type, so that only the true direct-current output was measured. A very steady loading was obtained, and the rectifier was run at 100-kw. output for four hours continuously. An average reading was:—A.C. volts, 554; amperes, 170; kw., 108.9; D.C. volts, 888; amperes, 290; kw., 96.1; efficiency, 90.1 per cent. The efficiency averaged well over 90 per cent. during the four hours, exclusive of the small amount of power required to run the vacuum pump. During the whole of this period it was not necessary to restart the arc by bringing the auxiliary electrode into use. The last hour was run with the pump at a standstill and the connecting cock closed, but the vacuum became gradually poorer, and it was necessary to restart the pump for further readings. At an output of 49 kw., the efficiency was 90.6 per cent.; at 9.9 kw, 89 per cent.; and at 2.3 kw. (65 amps.), 86 per cent. The arc was unstable at 5 amperes, and could not be maintained at 3 amperes. The temperature of the rectifier during operation remained within the permissible limit.

The rectifier is particularly adapted for charging or running in parallel with a 220-volt battery, as the charging pressure of such a battery would reach 825 volts, and the rectifier runs equally well at the lower pressure.

### THE PHASE BALANCER

IN order to counteract the unbalancing effect produced by single-phase loads on three-phase systems, a machine consisting of a synchronous condenser, i.e., an over-excited synchronous motor, in series with a three-phase booster on the same shaft, may be used. A description of the action of this machine is given in the *General Electrical Review* (Schenectady). A satisfactory explanation is obtained by regarding a single-phase current or field as being resolvable into two polyphase components with opposite phase rotation. An unbalanced load on a polyphase system is the combination of a true polyphase load with a single-phase load, and the latter may be resolved into its polyphase constituents, one of which has the same rotation as the polyphase load and therefore becomes part of it, while the other has opposite phase rotation. If, therefore, some means are provided for supplying to a polyphase system a current or voltage with opposite phase rotation which neutralises the corresponding component of the unbalanced load, it is evident that the result is a complete correction of the unbalancing. Now, since any induction or synchronous motor with squirrel-cage has a tendency to maintain an approximate balance of voltage in a polyphase system to which it is connected, by generating a balanced back E.M.F., which causes a current to flow if the terminal voltage is unbalanced, it is seen that if an E.M.F. is introduced in series with each phase to overcome the impedance of the winding, complete balancing is possible. If the only object of the phase balancer were to correct the unbalancing in current and voltage which is due to single-phase loads in some other part of the system, it would only be necessary to use a machine of the induction type with a squirrel-cage, and to direct-connect to it a polyphase booster with sufficient capacity to overcome the impedance drop in the windings of the main machine. If the single-phase load were of a definite and known power factor, the booster might have a single field of the ordinary kind; however, if the power factor of the load fluctuates at the same time as the current, means must be provided for changing the phase, as well as the strength of the E.M.F. introduced by the booster. This is done by providing the booster with a two-phase field winding and two separate sources of excitation. If the regulation of the balancer is to be automatic, the two booster fields are controlled by two voltage regulators adjusted so as to maintain the equality of the two phases with the third. The voltage of the third phase is then controlled by the main power station regulator working on the generator fields.

### MUNICIPAL ELECTRICITY SUPPLY Wiring Powers: Showrooms

WE referred in our issue for November 27th last to the general features of the electricity supply bills which will come before Parliament next session, but a perusal of the bills themselves brings out the interesting fact that several corporations are applying for municipal wiring powers with the proviso that all wiring of consumers' premises, as well as all sales of electrical fittings, shall be carried out through contractors, but powers are taken for the direct hiring of apparatus to the consumer by the electricity department. This point of view has been frequently expressed by central station engineers in the many discussions which have taken place in the long dispute between municipalities and contractors, and may eventually prove to be the solution of the difficulty. Quite a number of central station engineers feel they are considerably handicapped in their fight against gas, in that they have not the powers to hire out motors and fittings, and so far as these particular central station engineers are concerned, they are quite content to work through contractors for all wiring work and actual sales of fittings. The corporations which are asking for these powers include Weymouth, Barnsley, Worthing and St. Anne's-on-Sea. These same authorities and one or two others also take powers to approve the quality of material and the workmanship of installations carried out by wiring contractors. Several local authorities are further asking for powers to fit up showrooms and spend money upon advertising their electricity undertakings, a policy which, if persisted in without Parliamentary sanction, may lead to surcharges at the hands of the Local Government Board auditor.

## STORAGE BATTERY WITH COUNTER E.M.F. CELLS

AN interesting 150-cell 5,750-ampere-hour storage battery, the discharge of which is adjusted by remote controlled short-circuiting switches across twenty-four counter E.M.F. cells, is described in the *Electrical World* (New York). The battery is in use by the Union Electric Light & Power Co. of St. Louis, Mo., and is automatically thrown on to the distributing system when needed by low-pressure relays. The main battery, comprising 150 lead cells each with sixty-one plates in lead-lined boxes 49 in. long, 23 in. wide and 49 in. high, rests on cast sulphur blocks, coated with an acid-resisting paint. Porcelain tiles are embedded in the sulphur, and these carry  $4\frac{1}{2}$  in. porcelain cylinders with annular glass oil cups. The counter cells are made up of spun-type plates, both sets alike, contained in 41-plate tanks, 34 in. by 22 in. Most of these cells contain fifteen plates, but the last cells to be short-circuited have twenty-three plates and the next twenty-one plates. It is found that the energy lost in the cells is chiefly due to heating and dissociation of the electrolyte, and not in the formation of much active material. These counter cells are arranged twelve on the positive and twelve on the negative side of the main battery, and are short-circuited in groups of two, each pair being connected by 4 in. by 0.5 in. copper bars to its switch outside the battery room. Besides being controlled by push buttons from the switchboard, the switches may be worked by hand in emergency. The main battery leads are connected to the 220-volt three-wire distributing system through 12,000 ampere solenoid-operated switches arranged with low-pressure relays and hand control. When the 110/220-volt system pressure falls below the pre-determined figure, these relays cause the main switches to close, at once connecting the battery to the line, regardless of the voltage difference between line and battery, since the counter cells serve as a cushion, building up a reverse E.M.F. to prevent a sudden current rush. Even with the system at 240 volts between outers and the battery pressure 300 volts or more, it is said that connection has repeatedly been closed through the counter cells without appreciable voltage or current variation.

In succession, the attendant then short-circuits counter-cells until the battery is carrying its apportioned load. Its rating is as follows: 5,570 amperes for sixty minutes; 11,500 amperes for twenty minutes; 17,250 amperes for ten minutes; 23,000 amperes for six minutes. The capacity in kilowatts is: At the 5,750-ampere rate, 1,500 kw.; at the 11,500-ampere rate, 1,470 kw.; at the 23,000-ampere rate, 5,865 kw.

## METAL FILAMENT LAMP PATENTS

THE grant of the three patents by the Julius Pintsch A.-G. relating to the production of ductile tungsten filaments and numbered 5,026, 5,027 and 5,028, of 1912, has been refused by the Comptroller. Opposition was entered by the B.T.-H. Co. on the ground that no invention was disclosed, but that a special method covered by previous patents of a more general nature was made. The B.T.-H. Co. cited several patents as being anticipatory, including Nos. 24,179, of 1906, by F. W. Le Tall, to whom it was communicated by A. Lederer, of Vienna; 8,841, of 1907, by the A.E.G.; 8,421, of 1908, by the Wolfram Lampen A.-G., of Augsburg; and 18,467, of 1911, by W. D. Coolidge. An appeal to the Law Officer against the Comptroller's refusal to grant the patents has been entered.

The patents in question, Nos. 5,026 of 1912, 5,027 of 1912, and 5,028 of 1912, which were taken out in the name of J. Hubers, were communicated by the Julius Pintsch A.-G. of Berlin. Briefly they may be summarised as describing a process in which a compound of tungsten is mixed with between 1 per cent. and 5 per cent. of an oxide or an equivalent proportion of a compound of thorium or other rare earth metal, an alkaline earth metal or magnesium or zirconium, or a mixture. The mass is squirted and reduced in hydrogen, so as to avoid the formation of crystalline particles. The metals are finally alloyed together. Alternatively, colloidal tungsten may be used. In the second specification processes are covered for compressing the preliminary ductile filament, obtained as above described, by passing it through drawstones or rollers and subjecting it to drawing or rolling. According to the third specification, a thick wire or rod is formed from the paste, as in specification 5,026/12, and is drawn or rolled.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,373.

It is proposed to use the lead covering of three-phase, three-core power cables (which are laid solid in bitumen) for single-phase lighting at 260 volts. The three phases would be practically balanced, and the wiring for lights would be single lead covered. The machines are 450 volts, 50 cycles, with neutral and cables earthed at power station. The lead covering at the end of each cable is used for earthing. The longest length of cable is about 450 yards. What are the chief points to bear in mind on such a scheme? Would it be an advantage to earth each cable at the far end?—"PHASE."

(Replies must be received not later than first post, Thursday, January 15th.)

### ANSWERS TO No. 1,371.

A 230 volt installation is running on a circuit containing several electric cranes and other motors. An earth is reported on the main board, and in investigating this, two 230 volt 16 c.p. lamps in series were connected between the negative main and earth, and showed a red glow. When they ceased to glow they were tried on the positive side and glowed again. This change over occurred several times a day. Sometimes, however, the lamps would show a full light, which indicated that about 460 volts was present between one pole and earth. How can this be explained?—CONSTANT READER.

The first award (10s.) is made to "MARP," for the following reply:—

The fact that the installation includes an electric crane provides the key to this problem. The "earth" must have been situated in the electrical equipment of the crane, between the motor and starting switch; also, the crane in question must have been in use during the tests. The somewhat surprising effects observed are explained as follows:—I assume the motor switch to be connected on the positive side of the motor, the other side of the latter

being in direct connection with the negative main. If, while the motor is stationary, a connection is made from the "earthed" lamps to the negative main, no current will flow. The closing of the motor switch will put the lamps across the mains in parallel with the motor. Consequently the lamps will glow dimly until the motor is stopped again. On making

the connection from the lamps to the positive main the lamps would again light up dimly, owing to their being then in series with the motor armature, the resistance of which, when stationary, being negligible. If now, whilst the motor switch is still open, the motor is allowed to run backwards (during the operation of lowering whatever articles the crane is handling), it will generate an E.M.F. of approximately 230 volts, which, acting in conjunction with the mains pressure, will raise the pressure across the pilot-lamps' terminals to 460 volts, and cause both lamps to emit their normal candle power.

The accompanying sketch will enable the reader to follow the above explanation readily.

The second award (5s.) is made to "J. E. R. R.," who writes as follows:—

There appears to be in the first case a fault to earth on one of the crane motors, it being assumed that these are the only reversible motors on the circuit. That this is so is borne out by the reversing of the fault from one pole to the other. The fault is evidently on the armature circuit of one particular motor of a crane. It may be on the trolley wire insulators, or on the leads between trolley and motor or trolley wire and controller, or on one brush arm of motor. Of these places a faulty brush spindle insulator or trolley wire insulator are the most likely, though on some cranes grease and oil from the gears frequently cause earth faults on the wiring. It will be observed that the parts mentioned are the only ones that change from one pole to another, according to motor's direction of rotation. To locate the fault it will be necessary to try which crane brings on the earth by working each separately, then localising the motors. The second phenomena is not as much a fault as a bad or wrong connection. It is obviously due to the inductive voltage of some shunt field being broken without a discharge path. If the starters are rightly connected up, the shunt circuit should be permanently coupled across the armature circuit by feeding it from the first notch of the resistance through the no-volt release coil, but it may happen that some resistance coils are broken, in which case the permanent connection of armature and shunt is opened. It may be that some special connection of the starter or controller on one particular motor does not provide for the shunt being broken with a discharge path in parallel, which is a dangerous way of working, and to prevent breakdowns of the insulation a non-inductive discharge resistance should be at once inserted. It will be easy to see that this inductive voltage, which may be perhaps more than twice the normal voltage, will show to earth when it occurs at the moment when the earth exists on crane circuit. It will, however, be only a momentary rise, whereas the earth may keep on for some time. There is a possibility that the two faults may be on the one motor if there are reversible shunt-wound motors on this circuit, though this is not stated in the question. Knowledge of the local conditions will doubtless suggest a likely place where to look for the shunt field fault, but in any case it might be advisable to go round all the motors on this circuit and check up the connection, especially those of the shunt circuit.

## TECHNICAL AND COMMERCIAL EDUCATION, IN LONDON

A CROWDED meeting of London employers was held at the Mansion House on Monday, under the Chairmanship of the Rt. Hon. the Lord Mayor, when details of the London County Council's new scheme of evening continuation education were outlined. In spite of the large expense which has been incurred in this direction in the past, the general result of the work accomplished in the evening continuation schools has to be regarded as a failure, and the object of the meeting was to impress upon employers the necessity for their making some sacrifice in the way of allowing time off during the day time for their younger employees to continue the education which most of them abandon after leaving the elementary school at the age of fourteen or fifteen. The Council has now re-classified its evening-school work, and so far as technical work is concerned this is first started in what are now called junior technical schools, and is continued in the polytechnics. Mr. J. W. Gilbert, Chairman of the L.C.C. Education Committee, described the scheme, and speakers on the general question included Mr. J. A. Peace, President of the Board of Education, and the Marquis of Salisbury. One or two other gentlemen spoke as to the beneficial effects both to employers and employees of allowing time off in the day time to attend such classes.

# MODERN ENGINES AND POWER GENERATORS.

By Rankin Kennedy, C.E.

The Coupon below entitles any reader to a complimentary copy of an illustrated booklet, describing what is probably the most valuable work upon this subject ever published.

The importance of the subject is growing day by day, and "The Book of Modern Engines and Power Generators" can easily prove of the greatest value to those who desire to be fully informed upon the latest developments in every branch of the subject.

The author, Mr. Rankin Kennedy, C.E., is well known as an authority on his subject, and in this work he explains in the clearest and most thorough manner the design and construction of prime movers; the term is here used in its widest sense, as it applies to all engines, whether worked by petrol, oil, steam, air, gas, water, or electricity, and as it includes all machinery and processes connected with power generators and distribution.

## ENTIRELY UP TO DATE.

Moreover, all these subjects have been brought entirely up to date. The previous Edition of the work achieved such an immediate success, that for the new and Revised Edition, the scope of the work has been widened and extended so as to cover every branch of the subject, by the addition of a great amount of new matter, and many new illustrations of very great interest and high value.

This new Edition is indeed already recognised as the standard work on its many varied subjects, including Rotary Engines, Gas Turbines, Gas Engines, Oil Engines, Petrol Engines, Suction and Producer Gas Engines, Blast Furnace Gas Engines, Marine Engines of every design and type, Compressed Air Motors, Air Compressors, Refrigerating Engines, Windmills, with electric storage, Fluid Hydraulic Engines, Water Pressure Engines, Hydraulic Rams, Water Pressure Turbines, and Water Raising Engines, Centrifugal Pumps and Air Lifts, Power Distribution and Transmission by Gearing, Water Pressure, Compressed Air and Electricity, etc., etc.

## OVER 2,000 ILLUSTRATIONS.

The work is profusely illustrated by diagrams, text-cuts, and plates. In all there are over 2,000, every one of great practical utility to the engineer.

Enough has been said to show that this work is indispensable to all electrical, mechanical, steam, and hydraulic engineers, and to all who are concerned with manufacturing, designing, draughtsmanship, electro-chemical, and metallurgical work, with automobiles, tramways and railways, boilers, shipbuilding, collieries and mines, etc.

We would advise those who are determined to keep abreast with all the latest specialist knowledge concerning every detail of their profession to send for the free booklet which is supplied by the publishers to those mentioning this paper.

## A FREE BOOKLET.

To the CAXTON PUBLISHING CO., LTD.,  
97, Surrey Street, London, W.C.

Please send me, free of charge, a copy of the book describing the "Book of Modern Engines and Power Generators," and showing how it can be obtained for a first payment of 1s. 6d., the balance to be paid by small monthly payments.

NAME .....  
(Send this form or a postcard.)

Portable  
A.C. Wattmeter.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published January 1st, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

28,865/12. **Wireless Telegraph Transmitters.** G. MARCONI. A rotary disc discharger has its teeth equally spaced, or spaced in groups, and is mounted so that as one tooth passes one terminal of the circuit, another tooth (preferably that diametrically opposite the first) passes the other terminal. Air blasts are provided to blow out the sparks, and for large powers several discs may be mounted in series and all driven through gearing, or they may be arranged on a single shaft and connected in parallel. The discharger is used in a circuit tuned to the aerial circuit, but coupled to it through an intermediate tuned circuit. Six figures.

29,409/12. **Commutator Machines.** A. HEYLAND. To diminish the E.M.F.'s induced in the commutation zones of commutator machines for D.C. or A.C. circuits, a portion of all the zones is provided with auxiliary poles or coils, and another portion with recesses, open slots, or tunnels, which increases the magnetic reluctance and superposes the effects on those of the remaining commutating poles. As an example, in converters fixed points on an armature winding are connected to one circuit through slip-rings and to another circuit through the commutator brushes. The points on the winding from which connection is made are not distributed evenly. Four figures.

15,523/13. **Polyphase Synchronous Motors.** CROMPTON & Co. and H. BURGE. To start up and synchronise under load synchronous motors in which the armature has a main A.C. winding and a small D.C. exciting winding, a distributed closed circuit winding of the D.C. type is arranged on the field magnet so that it can act as an induction motor secondary at starting and as a field winding when the machine is up to speed. This is effected by providing two phase tappings, one for the D.C. excitation, which is applied through an adjustable resistance after the motor is run up to speed, and the other for a similar adjustable resistance, which is used at starting. One figure.

15,824/13. **Incandescent Lamps with no Bulb Pip.** WOLFRAM LAMPEN A.-G. The neck of the bulb is placed over a member carrying the leading-in wires, the stem for exhausting, and a mandrel. Heat is applied and the neck flattened, so as to seal in the wires, and at the same time the exhausting stem is fused to the bulb. Five figures.

19,439/13. **Combined Neon and Mercury Vapour Tubes.** G. CLAUDE. Neon and mercury vapour tubes are successively lighted and extinguished, so that, owing to the condensation of the mercury vapour by cooling, red, blue, and other coloured lights are obtained.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** SIEMENS DYNAMO WORKS and WILSON [Pressure regulation of systems fed through rotary converters] 29,338/12; B.T.-H. Co. (*G.E.Co., U.S.A.*) [Wire drawing] 2,001/13; SIEMENS DYNAMO WORKS (*Siemens-Schuckert*) [Regulation] 11,267/13; MEIROWSKY & Co., A.-G. [Mica sheets] 15,568/13; GRAHAM and RICKETS [L.P. direct current from H.P. alternating current mains] 15,769/13; SIEMENS-SCHUCKERT [Paralleling] 25,073/13.

**Dynamos, Motors, and Transformers:** HOLLISTER [Dynamos for lighting and ignition combined] 28,748/12; SOC. ANON. DES ETABLISSEMENTS L. BLERIOT [Electro-magnets] 28,864/12; SIMMS [Magnetos for ignition and lighting combined] 29,581/12; B.T.-H. Co. (*G.E.Co., U.S.A.*) [Vapour rectifiers] 5,448/13; RAILING and COLF [Motors] 10,535/13; HOLLISTER [Magnetos] 27,355/13 and 27,356/13.

**Electrometallurgy and Electrochemistry:** CHARLTON [Rotary electro-plating apparatus] 30,047/12; WARDALL and MARCHANT [Furnaces] 2,718/13; EYERMANN [Furnaces] 9,381/13.

**Ignition:** GUYOT [Self-starters] 17,989/13.

**Incandescent Lamps:** B.T.-H. Co. (*G.E.Co., U.S.A.*), 2,901/13; ZSCHOCKE, 6,143/13.

**Instruments and Meters:** LAWSON [Mercury motor meters] 882/13; HANDCOCK, DYKES and DUDELL [Resonance operated apparatus] 16,998/13; CHAMBERLAIN & HOOKHAM and HOLDEN [Mercury motor meters] 18,474/13.

**Switchgear, Fuses and Fittings:** HIRST and BROOK [Motor controllers] 28,634/12; WADE (*Protective Signal Mfg. Co.*)

[Switches] 28,977/12; BEEMER [Switches for automobile electro-mechanical gear-changing] 88/13; BOTT [Securing incandescent lamps in their sockets] 9,579/13.

**Telephony and Telegraphy:** AUTO. TELEPHONE MFG. Co. (*Auto. Elec. Co., U.S.A.*) [Telephone systems] 29,357/12 and 29,387/12; O'HARE [Telephone receiver attachment] 1,259/13; WESTERN ELEC. Co. (*Western Elec. Co., U.S.A.*) [Telephone exchanges] 2,509/13; SIEMENS & HALSKE [Semi-automatic telephone circuits] 6,664/13; CONNER [Telephone receivers] 7,348/13; STERLING TELEPHONE Co. (*Telephon-Fabrik A.-G. vorm G. Berliner*) [Indicators, &c.] 21,965/13; SIGNAL-GES. [Wireless radiator for aeroplanes] 23,728/13; SIEMENS & HALSKE [Telephone systems] 27,452/13.

**Traction:** PARROCK [Operating railway and tramway points from the vehicles] 259/13; ACFIELD and COOKE [Signalling] 8,009/13.

**Miscellaneous:** NAYLOR and NAYLORGRAPH, LTD. [Advertising by day and night] 21,191/12 and 19,122/13; WEIGERT-STERN [Automatic control of the temperature of fluids] 23,758/12; B.T.-H. Co. (*G.E.Co., U.S.A.*) [Refractory materials] 29,389/12; SCHNEIDER [Submarine mines] 29,392/12; KRAUS [Electrostatic apparatus for cleaning grit, grains, seeds, &c.] 11,852/13; KIENZLE [Automatic lathes] 12,235/13; FAIRWEATHER (*Ges. für Elek. Industrie*) [Money boxes for prepayment meters, &c.] 16,128/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Arc Lamps:** GEBR. SIEMENS & Co. [Electrodes for search-lights] 28,296/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** A.-G. BROWN, BOVERI ET CIE. [H.P. sleeve insulators] 27,734/13.

**Electrochemistry:** FARBERWERKE VORM MEISTER, LUCIUS & BRÜNING [Nitrogen and its oxides] 28,737/13.

**Ignition:** ANSCHÜTZ [Magnetos] 22,527/13; SCHRÖTER [Interrupters] 28,535/13.

**Switchgear, &c.:** RENAULT [Controllers for variable speed dynamos] 27,477/13.

**Telegraphy:** BLONDEL [Locating radio-telegraphic "light-houses," &c.] 28,183/13.

**Miscellaneous:** D'AMICO [Coating aluminium proof against seawater, acids, and alkalis] 28,410/13; MASSON [Illuminated signals] 28,542/13; J. ZARUBA & Co. [Primary batteries] 28,734/13.

The following Amended Specification may now be obtained:—  
**Switchgear, Fuses and Fittings:** E. J. WILSON and CANDOLITE Co. [Imitation candles] 1,178/12.

### Grant of Patents Refused

5,026/12, 5,027/12, and 5,028/12. **Ductile Tungsten Filaments.** J. HUBERS (*Julius Pintsch A.-G.*). The opposition to the grant of these patents (*ELECTRICAL ENGINEERING*, June 26th, 1913, p. 386, and Aug. 21st, 1913, p. 481, Vol. IX.) has been successful and the grant refused. The opposer was the B.T.-H. Co. An appeal has been lodged: see also p. 20.

### Grant of Patent Allowed

8,045/12. **Variable-Speed Dynamos.** C. A. VANDERVELL and A. H. MIDDLEY.

### Amendments made and Allowed

19,948/11. **Synchronous Rotary Spark Gap Transmitters for Wireless.** L. ROUZET.

22,342/04. **Arc Lamp Carbons.** KÖRTING & MATHIESEN A.-G.

### Application for Restoration of Lapsed Patent

4,030/08. **Concrete Telegraph Poles.** F. H. TIDNAM. The patentee seeks restoration of this patent, which expired on July 9th, 1912, as the renewal fee was not paid.

### Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** A. ECKSTEIN and A. E. ANGOLD [Suspension] 16,501/00; W. J. DAVY [Series lamps] 20,019/04.

**Dynamos and Motors:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [Insulating studs for collector rings] 20,929/06.

**Meters:** E. DU BOIS [Prepayment] 20,072/03.

**Switchgear, Fuses and Fittings:** VERITYS', LTD., and A. E. GOTT [Motor-starter] 18,620/05.

**Traction:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [Track circuit signalling in which double frequency currents are used] 20,542/06, and 21,766/08; L. BAILEY [Trolley collectors] 19,357/08.

## ELECTRIC TRACTION NOTES

There has been considerable progress in the work in connection with conversion of the London local lines of the London & North Western Railway, and the section from Earl's Court to Willesden will be running at an early date. This is being equipped on the same system as the District Railway with third and fourth rails of special low-carbon steel weighing 105 lb. per yd., supported on Doulton porcelain insulators attached to the sleepers by malleable iron clips. Special anchor insulators are provided at intervals to prevent creepage. The rails are being bonded with 1.4 sq. in. flexible Forest City bonds, and the jumper cables are of Henley's manufacture laid solid in bitumenised fibre troughs, and fitted with special sealing terminals designed by Mr. F. A. Cortez-Leigh (Chief Electrical Engineer to the L. & N.W. Ry.). The initial rolling stock for this section, consisting of four trains, was built by the Metropolitan Railway Carriage, Wagon and Finance Co., and the standard trains will be made up of one motor-coach, one trailer, and one driving trailer of the centre corridor type with all main control gear in a steel compartment in the motor-coach. Multiple unit control will be used so that two or more trains may be coupled together and any length of train driven from either end. The motors, on each motor coach, supplied by Siemens Bros. Dynamo Works, are four in number, each rated at 240 h.p. Pending the completion of the Company's own generating station at Stonebridge Park, current will be purchased. Progress is, however, being made with this power house, which is expected to be ready to receive the plant shortly. It will be equipped with five 5,000-kw. Siemens alternators driven by Westinghouse steam turbines; these will generate at 11,000 volts 25 cycles. There will be twenty Babcock & Wilcox boilers and elaborate coal and ash handling plant, for which the contract has not yet been announced. The substation plant will be supplied by the British Thomson-Houston Co., Ltd. 750-kw. and 1,000-kw. self-synchronising rotary-converters will be used in conjunction with transformers of the British Electric Transformer Co.'s make, and there will be a large battery controlled by a reversible booster in each substation. The feeder cables will be three-core paper-insulated, lead-covered, fixed in wood troughs on short posts above ground, and supplied by the British Insulated & Helsby Cable Co. Work is progressing on the Watford, Euston and Broad Street sections, and the first instalment of rolling stock for these will be electrically equipped by the Maschinenfabrik Oerlikon. Forty-three motor-coaches are on order from the Metropolitan Carriage & Wagon Co., and thirty-eight trailers and the same number of driving trailers are being built at the L. & N.W. Ry.'s Wolverton works.

The Lancashire and Yorkshire Railway have decided, on the advice of Mr. J. A. Aspinall, General Manager, to convert their line from Manchester to Bury to electric traction, and will use the third rail continuous-current system, such as is employed on their Liverpool-Southport line. The line in question is 9½ miles in length, with a short tunnel, and with stations at Woodlands Road, Crumpshall, Heaton Park, Prestwich and Radcliffe, and runs out at Victoria Station, Manchester. There will probably be a ten-minute service, augmented at the rush hours. The line is a busy one, and fares will be low to meet tramway competition. It is expected that the conversion will be complete in about twelve months, and that further extensions will follow. The scheme is quite distinct from the electrical working of the Bury-Holcombe branch, which is already being run experimentally on the high-tension continuous-current system with an overhead conductor.

The Board of Trade has at last condemned the Dolter surface contact system run by the Hastings Tramways Co. along the sea front. We have referred from time to time to the circumstances connected with this line, which the company has, for quite a considerable period, been anxious to abandon and substitute the overhead system. On the other hand, the Corporation would not agree to the surface contact system being abandoned unless the conduit system were substituted, but this the company maintained would be far too expensive to make it a profitable concern. Matters have therefore drifted on, and the long expected action of the Board of Trade has now been taken. Therefore, unless some agreement is come to between the Company and the Corporation, cars along the sea front will be removed altogether.

The City of Oxford Electric Tramways Co., which is owned by the National Electric Construction Co., now proposes to remove the existing horse tramways and provide motor omnibuses. This decision has been arrived at, apparently, owing to the inability to raise the capital for the conversion of the horse tramways to electric traction, and also in the absence of any agreement with the Corporation as to a modified scheme of electric traction.

We are informed by International Railphones, Ltd., that the Swiss Federal Railways have placed a third trial order for "K. K." detectors. They also inform us that with the aid of this instrument it has been found possible to transmit telegraphic messages through the St. Gothard Tunnel, which had previously been found impossible.

The L.C.C. is applying to the Board of Trade for permission to run additional trailer cars on its southern routes, in consequence of the success which has attended previous experiments of this nature.

Pending the receipt of the Board of Trade's sanction to the running of trailer and coupled cars, the L.C.C. Tramways Department is obtaining estimates for 150 trailer cars, and overhead equipment with couplers of about 200 of the existing cars. It is understood that the new trailer cars will be of a different pattern to those now in use, which consist of old horse-car bodies mounted on ordinary electric-car trucks.

It is announced that the Pennsylvania Railway is to use single-phase motor-cars on its suburban division from Philadelphia to Paoli, and that the Chicago, Milwaukee and St. Paul Railway will use 2,400-volt direct-current on the 440 miles of track in Dakota and Montana.

Mr. C. W. Mallins, General Manager of the Liverpool Corporation Tramways, has prepared an important report, in which he suggests the running of tramcars under the River Mersey between Birkenhead and Wallasey, in conjunction with municipal authorities in the eastern towns.

The Wolverhampton Corporation employees have, it is reported, asked permission of their union to take a ballot as to striking unless the Corporation agrees to cover in the ends of all tramcars, among other demands.

The capital of the British Columbia Electric Railway Co. is to be increased by £400,000.

A satisfactory trial has been run with a double-decked trolley-bus in Brighton.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The trawler owners of Hull, with the exception of one company, have decided to equip their fleets with wireless. For each fleet one trawler will act as a "mark" boat and remain stationary. Through it the messages will be transmitted to and from the Admiral trawler of the fleet. By this means the trawlers will be directed to the ports where the best market prevails.

The lattice mast for supporting the Goldschmidt aerial at the new wireless station at Tuckerton, New Jersey, is now complete. The tower, which is insulated on glass pillars, is 825 ft. high and has a hemi-spherical base which is free to move in a massive socket. It is made up of two sections hinged 480 ft. from the ground by a similar joint. It is kept vertical by twelve steel cables, each anchored in 1,100 tons of concrete. According to the *Standard*, similar stations are to be erected on the Pacific Coast of the United States, in the Pacific Islands, and in Asia.

A special meeting of the Hull Corporation was held on Monday to discuss the recommendation of the Telephone Committee, given on p. 685 of our issue for December 11th, that the telephone system in Hull purchased by the Post Office from the National Telephone Co. should be taken over by the Corporation at a price of £192,423, the Corporation being granted a new licence for twenty-one years as from January 1st, 1914. The purchase was agreed to.

Censorship has been established at Guayaquil on all messages to places in Ecuador excepting St. Elena.—The Tenedos-Lemnos cable was restored on the 6th inst.—The *c.s. Mackay-Bennett* had a collision off Gravesend, but proceeded on her way, although the other vessel had to be beached.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 27. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**ELECTRIC HEATERS.**—A new illustrated catalogue of electric heaters has been issued by the British Prometheus Co., Ltd. (9 Newman Street, Oxford Street, W.). This includes many artistic designs of both lamp radiators, and the company's special form of convectors, fitted with their open or armoured type elements of non-oxidisable metal films deposited on mica. A very large number of patterns are included, from simple electric heaters for business premises, to beautiful productions harmonising with the most refined styles of decoration.

**CABLES AND SUPPLIES.**—One of a series of leaflets issued by the Electrical Supplies Co. (41 Cheapside, E.C.) deals with wires, and contains net prices of a wide range of different qualities. Thus, for example, the prices of 3/22 cable per mile vary in nine steps from £9 to £23 6s. Other lists deal with Ferranti electric fires in a number of designs, Ferranti ovens and breakfast cookers.

**OZONAIR FOR MEDICAL PURPOSES.**—A new pamphlet, entitled, "Ozonair Apparatus for Therapeutical Applications," has been issued by Ozonair, Ltd. (96 Victoria Street, S.W.). After describing the valuable therapeutic value of pure ozone, a description of the well known Ozonair apparatus is given, followed by some extracts from the reports of medical men on the use of ozone for the treatment of different diseases.

**POTENTIOMETERS.**—A recently issued list by Crompton & Co., Ltd. (Chelmsford, Essex), deals in detail with the principles, construction, and use of the Crompton Potentiometer. This celebrated piece of apparatus as now made may be used for accurate measurements of various quantities, including resistance, the power absorbed by a motor, the efficiency of a pair of similar machines, the pressures on the two sides of a three-wire distribution system, as well as for instrument calibration, &c. The mirror galvanometer used has a moving coil with 100, 300, or 1,000 turns, and the sensitiveness of the instrument, when adjusted to give a complete period of oscillation of from 6 to 8 seconds, is approximately 1.1, 1.4, and 0.4 mm. deflection of the beam of light on a scale one metre distant for a P.D. across the instrument of one micro-volt. For one micro-ampere the deflections under the same conditions are 20, 56, and 160 mm. respectively.

### CHRISTMAS SOUVENIRS, &c.

The Jandus Arc Lamp & Electric Co., Ltd., are distributing to their friends a calendar bearing a fine coloured reproduction of an original crayon drawing prepared specially for them by Mr. C. E. Ritchie, of which they hold the copyright. They state that there will be no reprints of the picture beyond the limited number already prepared.

A very convenient-shaped narrow, thin pocket memorandum book accompanies the good wishes of Chas. H. Blume, varnish manufacturer, Sheffield.

We have received a neatly executed calendar from the Submarine Signal Co., which is made all the more interesting by the illustrations of vessels on which their submarine bell signalling system is employed.

The calendar of the United States Metallic Packing Co. is always attractive, and this year bears an embossed representation of Canova's statue at Hebe.

A very practical office calendar is that of Nalder Bros. & Thompson, who, in sending us a copy, inform us that they are shortly moving into much larger works at 97A Dalston Lane, N.E.

A neat little leather card-case has reached us from the Union Electric Co., Ltd.

### CRYSTAL GLASS FITTINGS

At the present time there is such great diversity in the schemes of decoration made use of, including the best of the old and historic modes as well as novel ideas of varying beauty, and the maker of electric light fittings has to enter into all these and to be able to supply numerous examples of his wares to accord with any style. The General Electric Co. (67 Queen Victoria Street, E.C.) have addressed themselves to this task assiduously, and a particular instance of their activities in this direction is afforded by the

FIG. 1.—CRYSTAL FOUR-LIGHT ELECTROLIER.

FIG. 2.—ORMULU MOUNTED CEILING FITTING.

FIG. 3.—GLASS CEILING FITTING.

fine new illustrated catalogue exclusively devoted to fittings in crystal glass which we have just received. A few of the fittings are illustrated here, and their variety is such that it is useless to attempt to particularise. The catalogue is admirably produced, and gives an excellent idea of the beauty of this series of fittings. Crystal glass fittings have a brilliancy and sparkle of their own which makes them harmonise well with rich and lavish schemes of decoration, and remind us of the styles in vogue in the France of the

Bourbons and of the glories of Versailles. Their modern applications are particularly the embellishment of dancing rooms, halls, restaurants and theatres, where a bright general illumination is required. The variety listed ranges from quite simple, inexpensive fittings to the most elaborate, and in most cases a few spare crystals or drops are included. We understand from the Company that no general distribution is to be made of this catalogue, but they will be pleased to forward a copy to those interested if they will apply to the Head Office at 67 Queen Victoria Street, E.C., or any of the provincial branches.

### A HANDY ELECTRIC GRINDER

A NEAT portable grinder, weighing only 5½ lb., which has been developed after careful experiments and tests by the Hamilton-Beach Manufacturing Co., of Wisconsin, has been put on the market in this country by H. W. Butler & Co. (Craven House, Kingsway, W.C.). The 4-pole series-wound driving motor is laminated throughout, and drives the wheel direct at about 10,000 r.p.m. It is rated at 1/12 h.p., and the set is furnished complete with strong flexible cord and plug, so that it can be attached to any electric light socket. Owing to its construction the same motor may be used on either direct or alternating current circuits, so that only the voltage has to be stated when ordering. The armature shaft is ground on centres to a mirror finish, and the motor is well ventilated so as not to become excessively hot on overloads. The adjustable end thrust and bearing provided take up all wear and play. The bearing caps are

PORTABLE GRINDER ATTACHED TO SLIDE REST.

dust-proof, so that grit and dirt cannot enter. The illustration shows the grinder in use in the ordinary lathe slide-rest doing some difficult internal grinding (a 1½-in. hole 4 in. deep can be ground out), though there are many other purposes for which it can be used, including the grinding out of small holes if carborundum or emery pencils are attached.

### A NEW IGNITION BATTERY

A N ignition battery with a novel feature is being introduced into this country under the name of the "Varta" battery, by G. Braulik (8 Lambeth Hill, Queen Victoria Street, E.C.). These cells are sent out from the German works of "Varta" Accumulatoren G.m.b.H. with the plates in a charged condition, but unfilled with acid. When sold to customers they only need filling with chemically pure sulphuric acid, and they are then ready for use. At the first discharge in this way some 80 to 90 per cent. of the full capacity can be obtained. If desired the batteries can be kept unfilled as a reserve and filled up just when required for use, as for example, when a battery in use has unexpectedly given out. They can be stored for practically any length of time in an unfilled condition so long as kept in a dry place. The "Varta" battery is constructed with pasted plates with cakes of active material. The plates are rigidly mounted in a celluloid box with ebonite separators, and have substantial lugs. The outer cases can be of sheet-iron or wood.

### AUTOMOBILE LIGHTING SWITCHBOARDS

WE have received particulars from A. P. Lundberg & Sons (477 to 489 Liverpool Road, N.) of two standard forms of switchboard for automobile lighting circuits which they have recently introduced. These are very compact, and the row of six switches, the fuses and an ammeter and voltmeter are arranged in a case no more than six inches wide. One form has a fuse in the battery circuit only, and the other, which is illustrated here and has a slightly higher bottom compartment, is

AUTOMOBILE LIGHTING BOARD  
WITH FUSES ON ALL CIRCUITS.

provided with fuses for each lighting circuit. The cases can be either of mahogany or aluminium, or a brass front can be fitted if desired. On one side there is a plug connection for a movable hand-lamp, and a push-button is provided in connection with the voltmeter. The firm has also introduced some useful patterns of plugs for automobile lighting circuits. One of the designs is provided with a non-detachable screwed ring for securing the plug to the socket, and can also be fitted with the lamp-holder pattern of cord grip.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Belfast.**—An expenditure of about £15,000 is contemplated in 1914-15 upon mains extensions, services, meters, &c.

A supply of cables is required by the Belfast Harbour Commissioners. Secretary, January 28th.

**Bradford.**—One 5,000-kw. live steam turbo-generator. City Electrical Engineer, January 22nd. (See advertisement on another page.)

**Brentwood.**—The Asylum Authorities require a petrol-driven electric lighting plant capable of dealing with 50 lights at the Harold Wood Asylum.

**Ipswich.**—Generating plant, rotary-converter, voltage-regulator, booster, cable connections, switchboard and switchgear are required. Borough Electrical Engineer, January 31st.

**New Zealand.**—The Feilding Borough Council invites tenders for two Diesel-engine-driven generating sets, switchboard, &c., for 2,400-volt single-phase 50-cycles. Further particulars at 73 Basinghall Street, E.C.

**Rotherham.**—The Borough Electrical Engineer recommends additional generating plant and buildings at a cost of £15,956.

**Rhyl.**—Extensions of power station. Borough Electrical Engineer, January 14th.

**Salford.**—Three-phase extra high-pressure and medium-pressure switchgear; also transformers. Borough Electrical Engineer, January 12th.

**Turkey.**—The Trebizond municipality invites offers by March 14th for a forty years' concession for electric lighting. An English translation of the conditions may be seen at 73 Basinghall Street, E.C.

**York.**—In consequence of the considerable demand upon the mains, the City Electrical Engineer has reported that additions will have to be made very shortly. He is giving this consideration, and is to submit a scheme.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Batley.**—School at Healey Lane.

**Canterbury.**—Additions to Kent County Lunatic Asylum. Architect, W. J. Jennings, 4 St. Margaret's Street.

**Grantham.**—Additions to isolation hospital.

**Guildford.**—New municipal offices.

**Longton.**—Cinematograph theatre. Architects, Nagington & Shellan, 35 Dale Street, Liverpool.

**Mountain Ash.**—New bank for Metropolitan Bank of England and Wales. Architect, T. W. Millar.

**Nelson.**—Improvements scheme, including erection of arcade, shops, billiard halls, &c.

**Northampton.**—Public baths scheme (£16,800).

**Reading.**—Cinematograph theatre, London Road. Architect, W. J. Hodgson, The Avenue, Camberley.

**Thirsk.**—Additions to hospital (£1,000).

**Warrington.**—New school at Oakwood Avenue.

**Worcester.**—New premises for Messrs. J. F. Willis, boot manufacturers.

**Worthing.**—New school (£8,000).

### Miscellaneous

**Accrington.**—Tenders are invited for three single-deck and two double-deck radial truck tramcars.

**Australia.**—Five 1,000-kw. rotary-converters, fifteen 865-kw. single-phase transformers, &c., for N.S.W. Government Railways and Tramways Department. Further particulars at 73 Basinghall Street, E.C.

**Canada.**—The Canadian Department of Public Works requires about 20,260 yds. of 4-core gutta-percha telegraph cable, and 28,370 yds. of 2-core gutta-percha telegraph cable, by May 1st. Further particulars at 73 Basinghall Street, E.C.

**Plymouth.**—A twelve-months' supply of arc-lamp carbons, meters, transformers, cables, &c. Borough Electrical Engineer, January 19th.

**Russia.**—Permission has been given to the St. Petersburg Municipal Authority to purchase electric tramcars from abroad.

**South Shields.**—An expenditure of £17,260 is contemplated on tramway extensions.

## TENDERS RECEIVED AND ACCEPTED

**Bath.**—A contract for a twelve months' supply of D.C. meters has been placed with Messrs. Chamberlain & Hookham.

**Bedford.**—The Corporation has decided to accept the lowest tender for a turbo-alternator at £5,938. As stated on page 723 of our issue for December 18th, 1913, twenty tenders were received for this plant, but so far the names of the tenderers have not been made public.

**Dundee.**—The Council has given the Chairman of the Electricity Committee and the General Manager powers to purchase a 5,000 kw. turbo-alternator either by repeat order or otherwise as they think fit. The results in the reliability of the Willans & Robinson turbines have been favourably commented upon in connection with this action of the Council, but no definite instructions have been given, the matter being left entirely to the judgment of the Chairman and Mr. Richardson.

**London.**—The Edison & Swan United Electric Light Co. have received a contract for 1914 for the supply of Royal Ediswan lamps to the British India Steam Navigation Co.

## APPOINTMENTS AND PERSONAL NOTES

Among the New Year's Honours we notice that Professor E. Rutherford, F.R.S., and Mr. W. E. Garforth have been created Knights. The latter has done a considerable amount of work in connection with the prevention of explosions in coal mines. Sir C. A. Cripps, who has been made a Peer, is, of course, well known as having taken a distinguished part in many leading arbitrations in connection with the electrical industry, not the least important of which were those in connection with the acquisition of the National Telephone Co. by the State, and the selection of the system of traction on the Metropolitan and District Railways.

Mr. Cyril Clarke, Borough Electrical Engineer at Birkenhead, has now been appointed Tramway Manager. Mr. Clarke, who was appointed Borough Electrical Engineer in succession to Mr. W. Wyld, on the latter's appointment to Hampstead last year, has been discharging the Tramway Manager's duties temporarily hitherto.

The Earl of Lauderdale, who was Chairman of the Great Northern & City Railway Co. prior to its absorption by the Metropolitan Railway, has now joined the Board of the latter.

The salary of Mr. C. C. Atchison, Borough Electrical Engineer at Rochdale, has been increased from £450 to £500 per annum.

We regret to learn the death of Mr. W. W. Alston, Chief Assistant Electrical Engineer to the West Bromwich Corporation.

## LOCAL NOTES

**Belfast: Street Lighting.**—The action of the Electricity Committee, in deferring for the present the electric lighting of North Street, created a little discussion at the last meeting of the Corporation, in view of the expression of opinion on the part of the police that this thoroughfare should receive similar treatment in the matter of electric lighting to the other important streets in the city. It appears that the Electricity Committee's action is due to the possibility of obtaining half-watt lamps in the very near future, and beyond urging that the lighting of North Street should receive favourable consideration, the Corporation did not give any definite instructions to the Electricity Committee.

**Birmingham: Explosion in Cable Inspection Box.**—Last Friday evening the lid of an inspection chamber at the corner of Station Street and Hurst Street was blown off, owing to an explosion which took place within. The immediate application of sand prevented a fire.

**Bolton: New Power Station.**—The turbines under construction by Messrs. Musgrave & Sons for the new power station have been reported to the Corporation as ready for inspection, and a deputation from the Electricity Committee is to visit Messrs. Musgrave's works for this purpose.

**Cheshire: Electric Supply Scheme.**—The Weaverham Electric Supply Co. has inaugurated a supply of electrical energy in a number of villages in the Weaverham district as an extension to the supply in Weaverham itself. The water of the River Weaver is made use of for generating purposes, and the scheme has been developed under the supervision of Mr. A. J. Leigh, Consulting Engineer. A special tariff has been evolved for cottages, and as an example the unlimited use of one light can be had for 3d. per week.

**Chorley: Electric Lighting.**—The Council and the Lancashire Electric Power Co. are in negotiation with regard to the latter applying for an electric lighting provisional order.

**Darfield: Electric Lighting.**—The Council and the Yorkshire Electric Power Company are negotiating with regard to a supply of electricity.

**Dundee: Supply Interruption on Christmas Eve.**—We have obtained particulars of a serious interruption in the supply in Dundee which occurred on Christmas Eve owing to a very unusual mishap. Owing to the non-delivery of plant due to increasing labour troubles in this country, all the existing plant was running at its full capacity just as dusk was coming on, when, unluckily, one of the B.T.-H. Co.'s employees, who was at work in connection with the extension of the high-tension switchgear, apparently had some slight accident which caused an arc from a high-tension bar, and made it necessary to shut down in order to stop the arc. The damage done to the switchboard was very slight, but the shut-down, which lasted for a quarter of an hour to thirty-six minutes in various districts, was, of course, serious. To be quite accurate, the pressure was not really entirely off the mains, as the old station at Dudhope was running, but could only keep the pressure up to about half the normal.

**Eastbourne: Supply Interruption.**—Mr. J. K. Brydges, the Borough Electrical Engineer, reported at the meeting of the Corporation on Monday, with regard to the recent interruption in the supply, in the terms of the account given on page 14 of our last issue. The Corporation passed a vote of confidence in the staff on the manner in which they worked to overcome the difficulty, and the suggestion was made that some system of sectionalising the mains would prevent any such occurrence in the future. This matter is now receiving the attention of the Borough Electrical Engineer and the Committee.

**Hove: Purchase Price of Company's Undertaking.**—According to the *Sussex Daily News*, the Corporation has agreed with

the Hove Electric Lighting Co. to pay a figure of between £175,000 and £176,000 for the company's undertaking. In coming to this agreement the Corporation has been advised by Messrs. Handcock & Dykes, who also recommend an expenditure of a further £20,000 in modernising the plant. This latter includes 600 kw. Diesel-engine-driven generating sets, bringing the total plant capacity up to 2,700 kw. Even now, however, the Corporation has come to no decision as to whether it will work the undertaking itself or not, and the carrying out of the extension works will no doubt depend on this decision.

**London: Islington: Workhouse Lighting.**—A L.G.B. inquiry was held at the offices of the Guardians last week with regard to a decision of the Board to instal electricity in place of gas in several of its institutions. The inquiry was the result of a protest on the part of eleven members of the Guardians against the use of electricity. The inquiry was private, and neither the Borough Electrical Engineer nor the representative of the Gas Light & Coke Company were allowed to be present.

**Peterborough: Large Power Contract.**—The Electricity Committee had entered into a contract for the supply of electrical energy to a large factory at a flat rate of 0.9d. per unit, the minimum consumption being 75,000 units, although the firm stated that the probable consumption will be between 175,000 and 200,000 units per annum. When the matter came before the last meeting of the Corporation, the expenditure of £1,888 upon mains involved in this contract was the subject of a good deal of comment and some opposition, and in the absence of the Chairman of the Lighting Committee the matter was referred back. It was explained, incidentally, that the mains involved in this large contract would also be available for supplying other consumers on the line of route.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Son, of 5, Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £67 to £67 10s. (last week, £68 5s. to £68 15s.).

**The Electrical Supplies Co.**—Mr. E. C. Beman (late of the Edison Swan Co. and the Brush Co.) and Mr. F. J. Allen (late of the Brush Co.) have commenced business at 41 Cheapside under the above style as wholesale factors of electrical apparatus of every description.

**Change of Address.**—Nalder Brothers & Thompson, Ltd., who, as announced on another page, will shortly be moving to a new works at 97A Dalston Lane, N.E., ask that for the next two or three weeks, till they are in full working order there, correspondence should still be addressed to 34 Queen Street, E.C.

**New Telephone Number.**—Messrs. Morris & Lister (3 and 4 Palace Chambers, Westminster, S.W.) inform us that their telephone number is now Victoria 7844.

**Oliver-Pell Lamp.**—The advertisement on page iii. of our last issue relating to the new Oliver-Pell Flame Arc Lamp was inserted owing to an error on our part, as Oliver Arc Lamp, Ltd., is not yet quite ready to supply the Oliver-Pell (120 to 150-hour) lamp, which is to supersede the "Oriflamme" at an early date. When the lamp is ready for the market we hope to publish a description of it and its advantages in our columns.

**Ediswan Motor Service.**—A card from the Edison & Swan United Electric Light Co. calls attention to the large fleet of motor-vans which they employ between the Ponders End works and other parts of the metropolitan area, and bears an effective illustration of a procession of these vans.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

THE "half-watt" lamp is now on the market in sizes of 600, 1,000, 2,000, and 3,000 c.p. The smallest size is made only for voltages between 50 and 65; the 1000 c.p. size for 50-65 and 100-130 volts; and the 2,000 and 3,000 c.p. lamps for voltages from 100 to 130, and 200 to 250. One maker also manufactures these larger sizes for 50 to 65 volts. Descriptions of the lamps, a review of the course of research which led to its development, the reasons which prevent its being made for small candle-powers at present, a consideration of the question of series connection, and the views of central station engineers all over the country on the prospects of the lamp in their districts, will be found in articles on pages 31 to 33, and 37 to 39.

A LETTER from an "Indignant Britisher" asks why England was three months behind Germany in placing the half-watt lamp on the market.—Mr. W. P. Durnall writes to the effect that though there may be isolated cases in which the electrical control of guns on warships has proved not to be perfect, yet there is no necessity to replace all electrical gears by hydraulic gears. (Page 34.)

To facilitate the comparison of tests of conductor rails, a collection of suitable test sheets has been published.—The scheme for running tramways under the Mersey is being considered by a Committee of the Liverpool Corporation. (Page 34.)

THE Portsmouth Corporation has decided to transfer its telephone undertaking to the Post Office for £35,000.—The Post Office has acquired the Inns of Court Hotel,

**BINDING "ELECTRICAL ENGINEERING."**—Vol. IX. of "Electrical Engineering" (Jan.—Dec. 1913) closed with our issue of December 25th, 1913. Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to THE KILOWATT PUBLISHING CO., LTD., Temple Chambers, London, E.C., carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad. Binding Cases (including index, but not including binding) 2s. each, or post free 2s. 4d. (Abroad 2s. 6d.) Index alone, 1d. (Post free 2d.)

Holborn, for the purpose of a telephone exchange. (Page 34.)

In a Paper read before the Institution of Electrical Engineers, Mr. B. Welbourn mentioned that there are over 1,000 miles of overhead high-tension transmission lines in the United Kingdom. He reviewed the various questions arising in their construction, and in the course of his Paper suggested that the Merz-Hunter split conductor system of protection rendered guard wires unnecessary, and also mentioned that Messrs. Merz & McLellan had discarded lightning arresters, and, instead of using them, increased the insulation on the end windings of the step-up and step-down transformers by 300 to 400 per cent. Mr. Welbourn also advocated the initial construction of lines for double the voltage for which they were intended, in view of a general increase in transmission pressures becoming expedient. In the course of the discussion the menace of H.T. overhead wires to air-craft was mentioned. (Page 35.)

THE regulation of the pressure of A.C. circuits, fed by alternators with different characteristics, by means of a single regulator, is dealt with in our "Questions and Answers" columns. (Page 36.)

MAINS extensions are required at Dorking (£2,000); Dublin (15,000); Hackney; Monmouth (£1,800); Napier (N.Z.) (£2,500); and Walsall (£600).—A scheme of extensions costing some £50,000 has been prepared at St. Pancras; the Lytham Council has decided to proceed with its lighting scheme (£23,700); new plant is required at Shipley (£27,000), and Wakefield (£18,000).—Stores are required at Marylebone, Cheltenham, and Belfast. (Page 40.)

THE Patent Specifications published last week include one for the pressure regulation of rotary converters by Siemens Bros. Dynamo Works, and J. C. Wilson. Another specification by Siemens Bros. Dynamo Works relates to the pressure regulation of A.C. circuits by the use of an auxiliary transformer and induction regulator. Two specifications by the B.T.H. Co. relate to the drawing of tungsten wires and to the use of cryolite for preventing bulb blackening in incandescent lamps, while one by H. Zschockf describes a method of mounting filaments using glass or porcelain spider arms. (Page 41.)

ERSOM has the honour of being the first town in this country to have a street lighted with half-watt lamps.

An illustration of this taken at night appears on page 42.

LONDON municipal engineers are unfavourably disposed towards any proposal to supply London in "bulk" from large power stations in the hands of companies.—A proposal that the Monmouth electricity undertaking should be sold has been rejected by an overwhelming majority.—A town's meeting is to be held at Redditch to consider a suggestion that the electricity undertaking should be handed over to a company.—The Carnarvon Council is inclined not to enter into any further "free wiring" agreements. (Page 42.)

**Institution of Electrical Engineers.**—The following is the result of the ballot for new members at the meeting on Thursday:—*Member:* R. Hersfeld. *Associate Members:* J. Denham, A. B. Eason, S. Evans, A. M. Field, W. J. Oswald, C. T. Pressland, J. P. Tivey, C. F. Wade. *Associate:* E. McKenzie. *Graduates:* F. Carr, H. Fasnacht, F. B. Joseph, A. J. Mavor, J. Morgan, F. C. Platt, F. A. Simpson, A. E. Smith. *Students:* H. G. Baker, R. A. Bottone, T. S. Brunton, R. R. Dawes, L. H. Field, W. J. Jones, A. W. Langridge, F. H. Mann, J. E. Odgear, B. Paul, P. Singh, F. K. Skevington, C. C. Sleigh, H. C. Vereker, P. Ward.

*Candidates Transferred—Associate Member to Member:* C. L. Cartwright, F. R. Marsh, J. M. Maxwell, E. E. Moore. *Associate to Member:* W. H. Ashman, A. F. Richards. *Graduate to Associate Member:* T. S. Mann. *Associate to Graduate:* O. C. Waygood. *Student to Associate Member:* J. O. Archer, F. A. Broadhurst, G. A. Hollings, C. G. Le Feuvre, J. A. Manners-Smith, C. A. Martin, H. T. Nadejde, H. Papazian, T. F. Potts, A. K. Roxburgh, J. A. Taylor, J. L. Thompson. *Student to Graduate:* L. J. Brennan, R. Gray, K. C. Mittra, W. C. Tisch, S. Wilkinson, E. Wyatt.

**Electrical Trades Benevolent Institution.**—A leaflet has been issued by the Electrical Trades Benevolent Institution, in which is set forth the necessary qualifications for membership and the advantages. The two chief of these are provision by the member for himself against the possibility of being in a destitute position, and help for those who have had the misfortune to arrive in that position. Members may also insure their lives on very favourable terms. The minimum subscription of members is 10s. per annum. Full particulars may be obtained from the Secretary, Mr. F. B. O. Hawes, of 18 Park Mansions, South Lambeth Road, S.W.

## ARRANGEMENTS FOR THE WEEK

FRIDAY, JANUARY 16TH.

*Manchester Electro-Harmonic Society.*  
7.30 p.m. Concert at Albion Hotel.

MONDAY, JANUARY 19TH.

*Institution of Electrical Engineers: Western Section.*  
5.30 p.m. At Bristol University. "The Employment of Power in H.M. Post Office," by H. C. Gunton.

TUESDAY, JANUARY 20TH.

*Institution of Post Office Electrical Engineers.*  
6 p.m. At Institution of Electrical Engineers. "Overhead Wire Construction for Medium and Low Pressures," by A. P. Trotter.

*Institution of Electrical Engineers: Manchester Students' Section.*  
7.30 p.m. At Municipal School of Technology. "Electrotherapeutics," by S. D. Anderson.

WEDNESDAY, JANUARY 21ST.

*B.E.A.M.A.*  
7 for 7.30 p.m. Annual Dinner at Savoy Hotel.  
*Wireless Society of London.*  
8 p.m. At Institution of Electrical Engineers. Address by President, Mr. A. A. Campbell Swinton.

THURSDAY, JANUARY 22ND.

*Institution of Electrical Engineers.*  
8 p.m. Fifth Kelvin Lecture by Sir Oliver Lodge, F.R.S.

FRIDAY, JANUARY 23RD.

*Physical Society.*  
5 p.m. At Imperial College of Science. The Agenda includes an Exhibition of a Water Model of the Musical Arc by W. Duddell, F.R.S.

## The London Electrical Engineers.

(TO-DAY) THURSDAY, JANUARY 15TH.—*C. Company.* Technical Instruction, 7 to 10 p.m.

FRIDAY, DECEMBER 16TH.—*D. Company.* Special Class on Crossley Engine and Technical Instruction, 7 to 9.30 p.m.

SATURDAY, DECEMBER 17TH.—*Headquarters open from 10 a.m. till 12 noon.*

MONDAY, JANUARY 19TH.—*A. Company.* Technical Instruction, 7 to 10 p.m.

TUESDAY, JANUARY 20TH.—*B. Company.* Technical Instruction, 7 to 10 p.m.

WEDNESDAY, JANUARY 21ST.—*Recruits only.* Infantry Drill and Technical Instruction, 7 to 10 p.m.

THURSDAY, JANUARY 22ND.—*C. Company.* Technical Instruction, 7 to 10 p.m.

FRIDAY, JANUARY 23RD.—*D. Company.* Technical Instruction, 7.30 to 9.30 p.m.

SATURDAY, JANUARY 24TH.—*Headquarters open from 10 a.m. till noon.*

WHAT'S IN A NAME?

**CUSTOMER (To Contractor).**—This shop is a good bit bigger than the others, and I want some really fine lighting. You had better put in whole-watt lamps here.

### THE HALF-WATT LAMP

ON Monday last the "half-watt lamp" was placed on the market in this country simultaneously by six firms of lamp manufacturers, whose names appear elsewhere in this issue. The sizes, voltages, and prices are as follows:—

300 WATTS (*approximately 600 British candle-power*).—50 to 65 volts. £1 10s. each.

500 WATTS (*approximately 1,000 British candle-power*).—50 to 65 volts, and 100 to 130 volts. £1 15s. each.

1,000 WATTS (*approximately 2,000 British candle-power*).—100 to 130 volts, and 200 to 250 volts. £2 10s. each.

1,500 WATTS (*approximately 3,000 British candle-power*).—100 to 130 volts, and 200 to 250 volts. £3 each.

The lamp is the outcome of a discovery made by Dr. W. R. Whitney, of Schenectady, after a long series of researches, that the blackening of the bulbs of tungsten lamps run at a high temperature is enormously diminished if nitrogen is introduced in the bulb, so that the filament glows in an atmosphere of nitrogen instead of in a vacuum. The importance of this is at once apparent from the fact that a tungsten filament, at a temperature just below the melting-point of the metal, would have an efficiency of 0.2 watt per c.p., whereas it is not found expedient to run ordinary tungsten lamps at a higher efficiency than between 1 and 1½ watts per c.p. Unfortunately, however, another phenomenon comes in, namely, that the presence of gas in the bulb has a cooling effect on the filament owing to the currents of heated gas rising from the hot filament, so that a certain amount of extra energy has to be given to the filament to compensate for the heat given off in this way. With filaments of large diameter, the additional energy required is not so great as to prevent a much better efficiency being obtained with the nitrogen-filled lamp, but the cooling effect of these convection currents is relatively much greater on a filament of small diameter. So marked is this contrary effect that, if an ordinary tungsten lamp were filled with nitrogen and then run so as to give the same light as a lamp of the same size with the filament in a vacuum, it would require more watts instead of less. This is roughly the reason why the present "half-watt" lamps can only be made in sizes of large candle-power.

To a considerable extent, however, the same result as giving the filament itself a large diameter can be arrived at by winding it in the form of a close helix, and this is the form of the filaments in the half-watt lamp as now developed. If the diameter of the helix is too great or the diameter of the filament too small, however, it will sag at the high temperature employed, as tungsten is soft at temperatures near its melting-point, and the turns of the helix would touch and short-circuit. Considerable further experimental research will therefore be necessary before lamps of low candle-power can be produced on this system.

The blackening of a tungsten lamp is partly due to two causes. One is simply evaporation of the tungsten itself, and the other is the presence of small quantities of water-vapour. The effect of the water-vapour is to attack the tungsten at its high temperature, producing a volatile oxide of tungsten and atomic hydrogen; the latter reduces the oxide, deposits metallic tungsten on the bulb, and combines with the oxygen again to form water-vapour, so that the process is cyclic. It is said, however, that in the best lamps the water-vapour present is extremely small, and that in them the blackening is entirely due to evaporation of the tungsten. The convection currents of the nitrogen gas which is introduced in the half-watt lamp carry the evaporated tungsten upwards, and it is deposited either on baffle plates, seen above the filaments in some of the makes of lamps, or in the neck of the bulb. This is one of the reasons why the necks of

the lamps are so long; another reason is that, owing to the convection currents, the upper part of the bulb would otherwise be liable to get too hot.

Readers who may desire to study further the extremely able course of research which has led to the evolution of the "half-watt" lamps, should refer to articles of a technical nature which appeared in *ELECTRICAL ENGINEERING* of October 9th and November 20th; they may also be interested in the light distribution curves published in our issue of January 1st. Further detailed information and particulars of a commercial nature will be found this week in our Trade Section and our advertisement pages. We also publish overleaf the opinions of central station engineers all over the country as to the applicability and prospects of the half-watt lamp in their districts, and of the situation generally.

### PROSPECTS OF THE HALF-WATT LAMP

HAVING in view the early advent of the "half-watt" lamp, we wrote last week to a number of supply station engineers all over the country to ascertain their views as to the prospects of the lamp in their districts. We give on the next two pages extracts from some of the replies received. It will be seen that the half-watt lamp is welcomed by practically all, and the demand for the new lamp is likely to be enormous. These letters show that in almost every town there is an immediate applicability of the lamp for outside shop lighting, while, on the other hand, the extent to which the prospects for street lighting with half-watt lamps are favourable, vary very much, owing chiefly to the different conditions in the various towns.

We have endeavoured on previous occasions to allay the "half-watt panic" among central station engineers, fostered, we regret to say, by some of our contemporaries. From the technical article which appears on this page, it will be evident that a 16-c.p. lamp or even one of 50-c.p., constructed on precisely the same lines as the 600- to 3,000-c.p. lamps described, would have a poorer and not a better efficiency than the existing 1½-watt metal filament lamps. That the difficulty will eventually be overcome is by no means improbable, but the knowledge already gained by the extremely clever and laborious research work will have to be largely augmented by further painstaking experiment in the laboratory before the goal is reached, and if a low candle-power half-watt lamp is produced within the next two or three years, it is bound to come in easy stages. When it does come, however, it will be the meter manufacturer and not the supply station manager who will enlist our sympathy, for, except to the larger houses, electric lighting will then obviously be supplied on a contract or "per lamp" system of charging.

Returning to the present situation, the question is sure to be asked by many central station engineers: Will it be worth while to use series connections for the 300- and 500-watt lamps, or will these sizes be soon available for 200-volt circuits? The answer is, use the lamps which are most suitable, and put up with the series wiring if necessary. The problem is not the same as with the 1½-watt tungsten lamp, for the candle-powers are so much greater, and the number of lamps involved in each installation so much less, that the amount of series wiring required as a temporary expedient would not be formidable.

In conclusion, we would warn our readers that the effect of the half-watt lamp upon the gas companies will be to stimulate their competition for the heating and cooking load, and, after this digression, we return to the immediate question of the prospects of the half-watt lamp in the various towns of the United Kingdom,

and quote the views of the supply station engineers in different parts of the country.

#### LONDON.

**Mr. J. S. HIGHFIELD** (Metropolitan Electric Supply Co.): The lamps give a most beautiful light, and I should imagine that a number of shopkeepers and others, desiring a specially powerful light, would use them. They may also replace arc lamps for street lighting purposes, but of course it all depends on whether the life is reasonably long and the price sufficiently low.

**Mr. C. P. SPARKS** (County of London Electric Supply Co.): My personal opinion is that all improvements of this kind are to be welcomed, as they open up new lines of business.

**Mr. H. W. KINGSTON** (Charing Cross, West End, and City Electricity Supply Co.): As a rule it takes many years for this type of lamp to develop into a low-priced, low c.p. commodity, but if this were an exception to the rule it would undoubtedly influence our revenue. Assuming the development to be slow, I am of the opinion that it will be of considerable advantage to this Company and the industry as a whole.

**Mr. G. W. PARTRIDGE** (London Electric Supply Corporation): This half-watt lamp will be a great thing to the companies supplying alternating current where street lighting is contemplated.

**Mr. A. H. SEABROOK** (St. Marylebone): The immediate benefit to be obtained is in the direction of assisting competition with high-pressure gas, especially for outside shop lighting. Many supply undertakings run a flame arc lamp hire and maintenance scheme for this purpose, and any improvement that cuts out the necessity for skilled attendance is to be heartily welcomed. Comparing the arc and the half-watt lamp we are going to use more of our own product, i.e., electricity, and pay less in wages and carbons.

**Mr. W. C. P. TAPPER** (Stepney): So long as they are put on the market in very large candle-powers only, I think they will be welcomed by all central station engineers, as such lamps will form a very useful substitute for arc lamps, particularly for street lighting. If, however, the makers are contemplating the manufacture of these lamps in smaller sizes, the development should be spread over a sufficient time to enable the industry to adjust itself to possible new conditions.

**Mr. W. WYLD** (Hampstead): Owing to their large sizes, their use for some time will be restricted to the lighting of main streets and large areas. The majority of our 2,500 public lanterns are equipped with two 40-watt, and in some cases, two 80-watt lamps. Anything which tends to cheapen electric lighting and therefore strengthen us in the competition with gas, is to be welcomed, but perhaps it is well that these highly efficient lamps have come to us in stages of such length that we have been able very nearly to recover from the reduction of current and revenue before the next lamp has been brought out.

**J. H. BOWDEN** (Poplar): In this area the whole of the original open type arc lamps have been converted to high c.p. incandescent, excepting in three main thoroughfares, where 87 flame arc lamps have been installed, so that there is the prospect of doubling the light without increasing the cost, provided the price of the lamps in each instance remains constant. I am looking forward to the advent of this lamp as a means of introducing indirect lighting into offices and public buildings; the efficiency of existing lamps renders the present cost for current prohibitive.

**Mr. A. GAY** (Islington): It is a very great pity that this lamp should have been boomed some twelve to eighteen months before it was obtainable, with the result that the competitive forms of lighting have been pushed to the fullest extent. In connection with the half-watt lamp we have lost quite a number of consumers, as business houses are not prepared to wait indefinitely, and even begin to doubt the truthfulness of the representative's statements.

**A. J. FULLER** (Fulham): I have always been an advocate of high c.p. metallic filament lamps for shop and street lighting purposes. The larger lamp, if it has a reasonable life, will enable us to double the c.p. in all our streets without affecting the cost.

**Mr. G. W. KEATS** (Woolwich): They will prove a most effective weapon against pressure gas, and generally tend towards improved lighting, as many of the arc lamps at present on the market, quite apart from the cost of trimming and cleaning, are excessively costly to maintain, and leave much to be desired with regard to steady burning. I am of opinion that the new lamps will eventually entirely replace them in the majority of the positions in which they are at present installed.

**MANCHESTER.**—**Mr. S. L. PEARCE** writes: There is a reasonable prospect of our using some of the new half-watt metal filament lamps, of large candle powers, in connection with certain street lighting extensions that we are carrying out within the next twelve months or so. It is also quite likely that these lamps may in some instances be preferred to flame arc lamps in connection with our outside shop front lighting scheme.

**GLASGOW.**—**Mr. W. W. LACKIE** writes: The lamp will be welcomed in the same way as the 14-watt lamp was welcomed, as it will enable us to compete more effectively with incan-

descent gas lighting. In the meantime, however, until we get a half-watt metal filament lamp taking less than 400 watts, the flame arc lamp taking less than a fifth of a watt per candle will hold the field for the lighting of the principal streets.

**SHEFFIELD.**—**Mr. S. E. FEDDEN** writes: I welcome any apparatus of improved efficiency, as I believe this is bound to have a good effect on the electric supply undertakings sooner or later. In the first place, large c.p. lamps should be useful for outside shop lighting, and should prove a useful weapon to the electrical undertakings to fight the high-pressure incandescent gas lamps. They will also doubtless be well suited for street lighting purposes.

**NEWCASTLE-ON-TYNE.**—**Mr. L. E. BUCKELL** thinks that the lamps will be of considerable use for shop front lighting, street lighting, and large open spaces, assuming that the life of the lamp is satisfactory. They will displace arcs owing to the saving in trimming and maintenance.

**DUNDEE.**—**Mr. H. RICHARDSON** writes: There is a wide field for half-watt lamps of the smaller sizes being used in shops, warehouses, workshops, &c., if the results are satisfactory. For street lighting, neither from a technical nor commercial point of view are they in the running with modern flame arc lamps, and it certainly would be impossible ever to convince the "man in the street" that they were anything like so good as the flame arcs.

**BELFAST.**—**Mr. T. W. BLOXAM** writes: In the absence of experience as to the life of the half-watt lamp, I cannot say how the total cost will compare with arc lighting. It would appear to be only slightly less. Double the number of points of distribution in the same area can, however, be got for the same money, and, further, those people who estimate the illuminating power of a high-pressure gas lamp by staring at the mantle, will have to give the palm to the new lamps after applying the same "test."

**CROYDON.**—**Mr. A. C. CRAMB** thinks that the whiteness of the light will probably make it suitable for large drapery and other stores, but says that the effect of the cost of the lamp, life of filament, &c., have still to be considered.

**WEST HAM.**—**Mr. J. W. BEAUCHAMP** writes: Unless the price falls to a much lower figure and the life is of the order of 2,000 hours, I do not think these high c.p. lamps will show any great economy over the one-watt pattern. For street lighting, in large areas the cost of production for such a good load factor supply is comparatively low. We are, however, looking forward very much to the trial of the new lamps as a means of fighting the high-pressure gas outside shops, although at present we have not been troubled very much with that competition, owing largely to the very low rates at which we are able to supply and maintain flame arc lamps.

**BRIGHTON.**—**Mr. J. CHRISTIE** thinks the new lamps will be admirably suited for certain classes of street and outside shop window lighting, and as the tendency is to increase the standard of lighting for these purposes, he believes that users will prefer the increased light to halving their bills.

**STOKE-ON-TRENT.**—**Mr. C. H. YEAMAN** says that potters in his district estimate factory lighting only at about 100 hours a year. A good deal has been done there, however, with arc lamps for outside shop window supply, supplied with current at a fixed rate per annum, and the half-watt lamp may replace some of these, which he would regret. Generally in this area he estimates that the half-watt lamp will have the same competition with high-pressure gas lighting, as the ordinary metal filament lamp has with low-pressure mantle gas lighting.

**BURY.**—**Mr. S. J. WATSON** writes: While I cannot go so far as to say that we should be better off without the improvement in efficiency, still I feel that for a time the general adoption of the half-watt lamp is bound to have a rather serious effect on the industry. The outcome of further investigation into the problem will undoubtedly result in the manufacture of lamps of small as well as of large size. We have recently passed through the rather difficult stage covered by the conversion of carbon to metal filament lamps, but very few undertakings found it necessary to increase the charge for lighting. The income per house per annum at the present time, where a charge of 3d. to 4d. per unit is made for domestic lighting, is so small that it appears extremely probable that a revision of the lighting tariffs will have to be made. Only one-fifth of the income of the Bury undertaking is derived from lighting, the remainder is from power. The increased efficiency of the new lamps will not, therefore, have such a serious result to us as in other districts of a purely residential character. I am profoundly thankful that it is quite impossible to effect any improvement which will reduce the consumption of a motor below the standard of 746 watts per h.p.

**IPSWICH.**—**Mr. F. ARTON** writes: It is a satisfactory feature that it appears at first in large units. It will put us in splendid position for fighting gas for outside shop lighting, and for getting all the street lighting into our hands. It gives the progressive manager another splendid weapon in militant publicity work, and may bring nearer the day of a real concerted effort in advertising work shared by undertakers and manufacturers alike.

**BARROW-IN-FURNESS.**—**Mr. H. R. BURNETT** thinks that the large majority of consumers will use the lamp for improving

the illumination of their premises, without altering their electricity bills, and that if the lamp proves reliable gas for outside shop lighting will cease to be a serious competitor. For street lighting the half-watt lamp will be the greatest boon; the increasing motor traffic calls for an increase in the standard of illumination in most towns, and few, he says, can afford flame arc lighting except for important thoroughfares.

**WOLVERHAMPTON.**—MR. S. T. ALLEN writes: It is quite possible that they will displace altogether the arc lamps for public lighting, for although their efficiency will not be as high as that of some of the modern flame arcs, their low maintenance cost and absolutely steady light will give them a very strong position. I propose to carry out some tests in the main streets here with these lamps immediately I can get hold of some.

**BIRKENHEAD.**—MR. G. P. SHALLCROSS sends us particulars of a scheme for hiring out high c.p. filament lamps for outside shop lighting, which he has had in use for about twelve months. The charges are extremely low. For instance, for three evenings a week from dusk to 8 p.m., one evening from dusk to 10 p.m., and one evening from dusk to 11 p.m., the charge is only £3 14s. per annum for a 400 c.p. lamp, £4 7s. 6d. for a 600 c.p. lamp, and £5 15s. for a 1,000 c.p. lamp, including wiring, fixing, current, and maintenance. In fixing these rates, he had in view the advent of the half-watt lamp.

**ABERDEEN.**—MR. J. A. BELL says that everything depends entirely upon the price and life of the lamps.

**CARLISLE.**—MR. F. W. PURSE says that in a city like Carlisle there should be a good opening for the half-watt lamp.

**LEICESTER.**—MR. T. R. SMITH is about to adopt the lamp for a test on one of the tramway routes, and adds that he will heartily welcome the day when the half-watt lamp replaces in toto the present one-watt lamp.

**BARNES.**—MR. C. S. DAVIDSON writes: When the metal filament lamp was first introduced, the factors and contractors reaped a rich harvest, whilst for the supply authorities there was a considerable period of depression which could have been counterbalanced to a large extent had they had the power to make a profit on the sale of lamps. Is not this the time for the I.M.E.A. or the supply authorities to demand (the system of proceeding cap in hand does not appeal to present-day legislators) an extension of powers which are so essential to the proper development of their undertakings?

**HARROGATE.**—MR. G. WILKINSON will give the lamps a trial for street lighting as soon as they are available. He hopes that the manufacturers will pay special attention to the growing practice of using incandescent lamps without lanterns for street lighting, and that they will provide a satisfactory copper lamp-holder to screw on to the ordinary nipples, and strong enough to maintain the lamp in position without damage during all weathers. [We fear Mr. Wilkinson's suggestion will not be adopted; owing to the large amount of heat developed in the neck of the lamp, weatherproof lanterns are deemed to be essential.]

**ST. HELENS.**—MR. E. M. HOLLINGSWORTH writes: I am very anxious to obtain a number of half-watt lamps of 1,000-c.p. for the purpose of street lighting. We have in St. Helens an inclusive charge for the supply and maintenance of the lamp and energy taken. The majority of the lamps in use at the present time are of the enclosed arc type, and we have some high c.p. metal filament lamps.

**HALIFAX.**—MR. W. M. ROGERSON writes: The difficulty most electrical undertakings are experiencing at the present time is the installation of high-pressure gas for outside shop lighting and street lighting, and we require, I think, a good arc lamp or metal filament lamp which can be installed, maintained, and run for 700 hours per annum for a charge of £4 to £4 10s. to the consumer.

**COVENTRY.**—MR. G. TOUGH says the lamps should be very suitable for exterior shop lighting, street lighting, and interior workshop lighting in sizes up to the 1,000 c.p.

**GRIMSBY.**—MR. W. A. VIGNOLES writes: Although large c.p. unshaded lamps outside shop windows form a crude and inefficient method of lighting, a certain number of shopkeepers will have them, and the gas company are getting a number of people to use high-pressure gas. With the half-watt lamp it should be possible to compete and more than hold our own against the gas interests. If the half-watt lamp sounds the death-knell of the arc lamp, I shall have no regrets, as I find it extremely difficult to pay sufficient attention to arc lamps to ensure satisfactory results.

**NEWPORT, MON.**—MR. A. N. MOORE writes: It must, of course, be only a matter of time before half-watt lamps of all normal candle-powers are put on the market, and this, in my opinion, is the serious aspect of the question from the central station engineer's point of view. It emphasises the necessity for the pushing forward vigorously of a heating and cooking campaign.

**EXETER.**—MR. H. D. MUNRO has been only waiting for the appearance of these lamps to bring out a scheme for extending electrical street lighting. For outside shop lighting, he thinks they will be even more valuable, as from his own observation he believes that the high-pressure gas lamp is anything but satisfactory to the consumer.

**CHELTENHAM.**—MR. W. J. BACHE thinks that the introduction of the half-watt lamp will not have much effect on output, and that its adoption for general use will be very much more gradual than that of the one-watt lamp. He believes, however, that it will lead to a considerable extension of outdoor and display lighting.

**BEDFORD.**—MR. R. W. PHILLIPS does not fear the advent of the half-watt lamp any more than he did the 1½-watt lamp.

**LUTON.**—MR. W. H. COOKE regrets that the lamps will only be made in very large candle-powers at first. These will meet a very great need as a competitor to high-pressure gas, but he looks forward without fear to the day when half-watt lamps can be obtained at the same price and similar candle-powers to the existing metal filament lamp.

**ASHTON-UNDER-LYNE.**—MR. N. APPELBEE will find an immediate use for the lamp in competing with high-pressure gas, which the local gas company offers to the public at very moderate terms, fixed and maintained free.

**WALSALL.**—MR. A. S. BARNARD anticipates that the lamp will prove the most useful and efficient counterblast to the high-pressure gas lamp for shop lighting.

**LOUGHBOROUGH.**—MR. W. H. ALLEN will welcome the lamp for use in street lighting and large factory installations where high-pressure gas is being employed.

**EASTBOURNE.**—MR. J. K. BRYDGES writes: Although at first the half-watt lamps will require separate transformers, as the smaller lamps will not be made for use on our 200-volt supply, they will prove most useful for lighting the outside of business premises and for other purposes, and as a satisfactory lamp to fight the high-pressure gas lantern.

**LEATHERHEAD.**—MR. H. L. DIXON writes: For street lighting and shop lighting, they will be a valuable weapon, and where the bulk of the station's output is for power their advent will have no detrimental effect on the revenue. Where lighting is the chief load, the future outlook is serious.

**LEYTON.**—MR. F. HARMAN LEWIS anticipates a demand for the lamps of medium size if experience shows they have reasonable life and are not too expensive.

**WATFORD.**—MR. A. W. BARRHAM writes: As the whole of the Watford street lighting is electrical, the half-watt lamp should undoubtedly be of good service, providing that the cost and life are such that the difference in current consumption is not nullified. After the benefits which have accrued to the central stations since the introduction of the metallic filament lamp with its low current costs, I see no reason to anticipate other than like results from the half-watt lamp.

A large number of further letters have been received, extracts from which will be published in our next issue.

## CORRESPONDENCE

### WHY WAS ENGLAND LATE?

*To the Editor of ELECTRICAL ENGINEERING.*

SIR,—The tungsten lamp owed its origin to the inventions of Auer von Welsbach and Just and Hanaman; it was to be expected, therefore, that it should appear on the Continental markets before it was manufactured in this country. The first drawn-wire tungsten lamps were developed from American and German patents, following upon researches carried out by the General Electric Co. of America and the Siemens Co. in Germany, and one cannot grumble because the electrical industries of those countries should have derived the first benefit from this improvement. But with the half-watt lamp it should have been otherwise. It is evident that the various firms who announced their half-watt lamps to-day are working in concert, and it is more or less common knowledge that some or all these firms have arrangements by which they are free to employ the processes patented by any one of them or their American and German associates. The half-watt lamp is apparently made in accordance with a process patented in America, and presumably available automatically, under this arrangement, to a number of these firms manufacturing lamps in England as well as to some of the German lamp manufacturers. Yet the Germans were able to develop their lamps, and to place them on the market at the beginning of October, and we in England are three months late. Why must this be so? In the days of the carbon filament lamps, the British-made lamp was second to none. We have many years' experience in the manufacture of tungsten lamps, our lamp factories are said to be as well equipped as those in any other country, and are presumably managed by men whose technical and commercial knowledge is of the best. Why must we lag behind Germany to the extent of three months? Why was England late?

Yours, &c.,

Jan. 12, 1914.

INDIGNANT BRITISHER.

### THE ELECTRICAL GEAR OF H.M.S. "INVINCIBLE."

*To the Editor of ELECTRICAL ENGINEERING.*

DEAR SIR,—An astounding announcement appeared in the *Pall Mall Gazette* on December 31st last, to the effect that the above vessel is to now have a refit at a cost of £200,000, most of which amount is to be spent in replacing the existing "electrical" gun-working gear by "hydraulic." It was stated that, although much money and time had been devoted to perfecting it, the electrical gear had turned out a failure.

I have been in touch with ship-owners and builders for many years now, and have endeavoured to enlighten them on the great economy of electric driving, and they are gradually coming to the conclusion that it is true. Many ships have been fitted with electric driving, and are in operation with great success in various parts of the world; still shipowners, when approached, will now say that if specialised men (as in the British Navy) cannot make and run electrical gear, they don't want it on their ships. Bearing in mind that the Merchant Marine is the greatest field for electrical driving, the result of the above statement concerning the *Invincible* is a great blow to the electrical power trade.

Now, Sir, the British Navy is a public service, for which the people of this country are paying plenty of money, and, as members of the joint ownership of this national service, we electrical engineers should now demand the true facts of this supposed failure, and a thorough investigation should be made by a representative body of electrical power engineers, to see if the failure is not without remedy, considering the enormous damage done to our industry.

This ship is one of four fitted with electrical power for gun-working in the British Navy, and was tried in 1908, when it was found that there existed certain defects. The question was raised in Parliament, and a reply was given that the defects were entirely got over in February, 1910, and now comes the news, after five years' devotion to the matter, that close on quarter of a million pounds sterling is to be spent in making the change.

I have no doubt that the existing electrical gear on the *Invincible* has defects, but I fail to see why the whole system of electric driving should be so condemned. We have at our disposal the latest polyphase alternating-current system for turret operation, and which can hold a gun on the target when ship and target are travelling at different velocities, or when the ship may be pitching or rolling; and, being alternating current, the well-known defect in all D.C. heavy torque and slow-speed power systems is avoided, and the torque-speed variation for either depressing or elevating guns or turret-turning can be, if anything, more effective than hydraulic methods—from, say, a motor speed of 600 r.p.m. down to, say, 1/15th revolution per minute, or 1 r.p.m. per quarter-hour with full torque

on, and with no steps in the speed or torque up to the top speed.

I give below a list which shows the numbers of ships in the navies of the world which have electrically-operated guns and ammunition hoists. It is strikingly interesting to note that even though the people have to pay nearly £50,000,000 per year on naval armaments, that Great Britain has four ships fitted with rapid-loading electrical gear, whilst other countries, from their actual war experience, are still demanding it. The number of ships fitted with electric gun equipments are as follows:—

France, 36; U.S.A., 32; Germany, 30; Japan, 18; Russia, 14; Austria, 14; Italy, 9; Great Britain, 4. Electrical gun gears are also used in the Chilean, Chinese, Argentine, Spanish, and Brazilian navies.

Comment on the above is almost needless. To say that electrical power is a failure is absurd. French, American, German, Japanese, Russian, and other naval artillery engineers have the experience of modern and practical warfare, especially those of Russia and Japan. The British electrical industry should demand an investigation into the matter before this public money is squandered.

Yours faithfully,

76 Gladsmuir Road, N.

WILLIAM P. DURTNALL.

## ELECTRIC TRACTION NOTES

To facilitate comparison of the results of electrical tests of conductor rails which are not expressed in the same terms, a complete edition of the test sheets, dealing with conversion factors, tables, &c., prepared by the Technical Bureau Department of Ridsdale & Co. (3 Wilson Street, Middlesbrough), is now available at the price of 6s. The sheets have hitherto only been obtainable singly. They are of considerable value.

A committee has been appointed by the Liverpool Corporation to consider in detail the scheme for running tramways under the Mersey.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The Portsmouth Corporation Telephone Committee's recommendation that their undertaking shall be transferred to the Government, the purchase-price being £35,000, has been adopted. The Portsmouth licence in the ordinary course would not expire until 1926, and an offer by the Postmaster-General to sell the Post Office system to the Corporation similarly to Hull was declined. Considerable interest attaches to this decision, as Portsmouth will be the last of the municipalities who set up telephone systems of their own, to deal with its undertaking under the altered conditions since the National Telephone Company was transferred to the Post Office. The Glasgow, Brighton, Tunbridge Wells and Swansea undertakings were disposed of some years ago, and, as reported in our columns last week, the Hull Corporation has decided to purchase the Post Office system there. Thus there will only remain one municipal system in the United Kingdom, but the action of the Hull Corporation and the lower rates which it intends to charge to the Post Office subscribers has set a number of other municipalities thinking in the same direction, and reports, among other places, from Dundee, Manchester, and Sheffield show that public opinion is inclined to be in favour of attempting to follow Hull, although, of course, it is extremely improbable that the Postmaster-General would sanction any such course, in the absence of an already existing municipal system.

The Inns of Court Hotel, Holborn, is to be purchased by the Post Office for the purpose of a new telephone exchange.

Marconi's Wireless Telegraph Co. was licensed on January 1st to conduct a wireless service between Poldhu and Spain.

On 6th inst. the Tenedos-Chio cable was restored.—On the 16th inst. it will be possible to send deferred telegrams to Monrovia, Conakry, Libreville, the Belgian Congo, &c. This class of telegram is not, however, admitted by the Amazon Telegraph Company.—Communication with Siam *via* Moulemein, and between Moulemein and Kanburi is down.—Telegrams for Siam are sent *via* Madras-Saigon. Telegrams for Santa Elena-Ecuador are subject to censorship. The Minister of Posts and Telegraphs of Albania notifies that cipher or code language is prohibited in private telegrams.—Communication with Siam was restored on January 10th.—The "Indo" lines were down between Kertch and Soukhouni-Kale on 11th inst., and restored on the 12th.—Telegrams to Syria are subject to delay, the lines between Adana and Alep and Diarbekir Alep being down.

## THE INCREASING USE OF H.T. OVERHEAD LINES IN THE UNITED KINGDOM

MANY engineers will be surprised to know that there are now over 1,000 miles of overhead high-tension transmission lines in the United Kingdom working at pressures from 2,000 to 20,000 volts. Of these, 115 miles are at 20,000 volts. The longest extends twenty miles, and one forty miles in length is under consideration. This information was given in the introductory remarks of a valuable Paper dealing with British practice in this direction, read by Mr. B. Welbourn at the Institution of Electrical Engineers last Thursday. The Paper has also been read at the Birmingham and Manchester and Yorkshire Local Sections.

The author estimated that for 6,000 volts an overhead line costs only about £900 per mile, compared with £1,400 for an equivalent cable, while for 20,000 volts the costs are £950 and £2,100 per mile respectively. Costs per mile, however, are not the only items to be considered in a transmission scheme, for, as an offset to the cost of wayleaves for overhead lines, cables generally have to follow more circuitous routes, as was pointed out in the discussion by Mr. W. B. Woodhouse (Chief Engineer and Manager, Yorkshire Electric Power Co.) and Mr. C. Vernier (Mains Engineer, Newcastle-on-Tyne Electric Supply Co.). It was also suggested that the present was an opportune time for the Institution Council to take up the consideration of the wayleave question with the Government, since, besides the tedious process of getting wayleaves at all in this country, the cost was more than sufficient to purchase a strip of land some 10 yds. wide for the whole length of the pole line in most other countries. The author also suggested that the Council might now usefully consider the appointment of a permanent Transmission Lines Committee, with a view to evolving standard specifications of materials, watching and reporting on important modifications of the Regulations and practice affecting overhead lines in this and other countries, advising the Council on representations to be made to the Board of Trade, other Government Departments, the Engineering Standards Committee, &c.

In the course of his Paper, Mr. Welbourn described systems of guarding conductors, and showed the simple triangular guard recently devised by Mr. A. P. Trotter, but he suggested that with the use of the latest automatic protective devices, it should be allowable to dispense with guard-wires altogether. There is reason to believe, he said, that the line wires become dead within one-eighth of a second after the occurrence of a fault, short-circuit, or the breakage of a wire, when the Merz-Hunter split-conductor system is employed. The Merz-Price system, on the other hand, although it will cut out the line within one-twentieth of a second when an earth fault or short-circuit occurs, will not deal with the case of the opening of a circuit by a wire breaking until the wire actually becomes earthed. Mr. Welbourn was of opinion that the time was approaching when it would be justifiable to ask for the Board of Trade's consent to run high-tension lines along public roads where the conditions are suitable. Mr. Trotter, speaking, we presume, unofficially as usual, said that the B.O.T. regulations could be regarded as representing the best practice of the day. He himself had proposed years ago that high-tension lines could be run along the sides of roads, but it was found to be hardly worth while, since all the straight roads were already monopolised by the Post Office. He noted that Mr. Welbourn was in favour of using transformers on the poles for affording supply to consumers on the route, but he would be very sorry to see little transformers, the size of hat boxes, dotted along a line, as they were very dangerous. Commander Schwann, R.N. (Admiralty Aerial Department), spoke of the danger to aerial navigation of cross-country lines from fire, and also because they were very difficult to see. He suggested that they might be limited to certain areas, and maps of the positions of all the lines in the country prepared. Mr. Welbourn, in reply, said that the point was an entirely new one to him, and he thought that it might be advisable to forbid overhead lines within a radius of five miles or so of any coast air-station, so as not to interfere with the defences of the country.

Although the subject of earth plates and earthing was dealt with quite briefly in the Paper, a considerable portion of the discussion was devoted to it. It is now generally recognised that a continuous earth wire should be run along all overhead transmission lines, and earthed frequently by small plates about 1 ft. 6 in. square. Another point mentioned was the trouble experienced in all parts of the country by birds earthing the lines through their bodies.

The author advised the use of aluminium in preference to copper when the cost of the former gives the cheaper line, except where the air is laden with sulphurous products. In this connection Mr. Woodhouse pointed out that with aluminium the sag is greater, and therefore higher towers are necessary, and a greater spacing must be adopted. Pressure regulation is not so good by something like 4 per cent.

Mr. Welbourn summed up in an admirable manner the present knowledge as to lightning arresters, and the reasons for failure of the horn arrester combined with a non-inductive resistance in the earth circuit, and a choking coil in series with the line. Moscicki condensers, although high in first cost, he said, are slowly coming into use, but are always installed, as a matter of course, on new lines. Messrs Merz & McLellan have discarded lightning arresters on all new lines connected through step-up and step-down transformers, and adopt the device of increasing the insulation of about 10 per cent. of the end turns of the transformers connected to the line by 300 or 400 per cent.

Telephone and pilot circuits were fully discussed by Mr. Welbourn. Suspended lead-sheathed cables are commonly used for this purpose. The author attributed failures of these to the omission of the necessary 2½ per cent. of tin in the lead sheath and unsatisfactory suspension. He described and eulogised a form of suspension patented by Mr. C. E. Elder, and used in the Newcastle district. The lead sheath, he recommended, should be definitely bonded at every fifth pole to the supporting earth wire in order to carry away any charges induced by the power lines.

No Paper or discussion on overhead transmission lines is complete without the usual comparison between steel and wooden poles. In the industrial districts, Mr. Welbourn pointed out that the spans do not usually exceed 85 yds. in length, so that it is cheaper to use wood poles; but in any case, he explained, steel poles should not be used in a smoke or fume-laden atmosphere, without careful consideration. In any case all steelwork should be galvanised and treated with a bitumastic paint. Wood poles should be erected soon after creosoting, and should not be cut after this if it is avoidable. Any incision made should be treated with a hot tar. Mr. Vernier said that he had never yet been able to make out a case for steel poles, but Mr. C. W. Kay (Callender's Cable & Construction Co.) described the simple tubular steel pole, of great strength and very easy to erect, recently perfected by his firm.

On the question of the spacing of conductors, the author recommended a minimum of 3 ft. apart for 20,000 volts, 2 ft. 6 in. for 11,000 volts, and 2 ft. for 3,000 volts and for 6,000 volts, but Mr. Woodhouse thought these spacings too great. There is a growing tendency to mount the lines horizontally or vertically, but duplicate circuits often suffer equally in a storm, so that, as Mr. Vernier said, there is more chance in case of an accident to continue the supply on a ring main system. For the tying-in of conductors the author condemned the rigid and advocated the flexible binder; he also described a "semi-rigid" one designed by Mr. G. K. Paton, and used with success by the North Wales Power and Traction Co. Galvanised channel, he said, is found most useful for the cross arms, but this, being earthed, has one disadvantage on lines which are operated with an earthed neutral and are controlled by any form of instantaneous overload or automatic protective apparatus. Big birds, chiefly crows, stand on the arms and peck at the live wires with results altogether disastrous to themselves, but involving nothing worse than a shut-down of the line and an interruption of the supply. This trouble is usually experienced from May to August while crows are young and presumably learning wisdom. The difficulty has been overcome on several lines by providing porcelain bushes round the insulator pins—pin-type insulators are generally used—from the channel arms upwards into the insulator, and by clipping pieces of bitumenised fibre conduit on to the arm so as to insulate the bird. On delta-connected lines birds are frequently killed, but no shut-down of the line is involved.

As the working voltage has scarcely any influence on the first cost of a line, the author put forward the suggestion that, in view of the rapidly increasing loads in industrial districts, all main lines should be designed so that they might ultimately be worked at a higher pressure than that at which they are first operated. For instance, 6,000- and 11,000-volt lines might be designed for a pressure of 20,000 volts, and 20,000-volt lines for 40,000 or 50,000 volts. He thought that there could be no doubt that the time is approaching when there must be a further raising of working pressures on main alternating-current high-tension circuits, similar to the big change which was made in passing from 11,000 to 20,000 volts on underground cables eight years ago.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,374.

When an induction motor develops a loose connection in the rotor, the ammeter will be caused to set up a periodic swing. It is desired to know the relationship which exists between this swing, the frequency, and the number of poles. Explain fully what causes the swing.—"DUB."

(Replies must be received not later than first post, Thursday, January 22nd.)

### ANSWERS TO No. 1,372.

When slow-speed alternators of low reactance and fine regulation are coupled in parallel with high-speed turbo-generators with high reactance and coarse regulation, can the voltage of the circuit be kept constant by installing one automatic regulator? If this be possible, and as the load saturation characteristics of the two types of alternators must differ, how is the excitation point determined at which connection should be made to the regulator, in order to obtain the best results as regards constant voltage?—"X."

The first award (10s.) is made to "W. A. H." for the following reply:—

When slow speed alternators of low reactance and fine inherent regulation are running in parallel with high-speed turbo-generators with high reactance and coarse regulation, it is quite possible to control the voltage of supply by means of one automatic voltage regulator. The best method of accomplishing this is to connect the regulator to the largest machine, and to carry out the whole of the regulation on this one machine. If this machine happens to be the machine with the coarse inherent regulation (as is generally the case, the turbo-plant being usually of large units), the matter is greatly assisted. The remaining machines are then set with a constant excitation, the value of which depends a great deal on the conditions. This method is usually termed "trailing." For example, we will take it that the load variations are from no load to full load of the whole of the running plant. The best results would then be obtained by setting the excitation of the uncontrolled or trailing machines to the excitation required to give normal volts at half load, and at this point the regulator will adjust the excitation of the machine under its control to the value required to give normal volts at half load, and the power factors on each machine will be equal.

At no load the excitation of the trailing machines would be too high, but the regulator will maintain the supply voltage at its normal value by weakening the field of the machine under its control sufficiently to allow it to draw a magnetising current from the trailing machines of a value just large enough to reduce the voltage of these machines to normal. The value of this magnetising or wattless current depends on the inherent regulation of this machine, but being 90 deg. out of phase with the potential, it has a great demagnetising effect, and therefore does not reach an appreciable value. Of course, the reverse operation takes place at full load, that is to say, the trailing machines are then under-excited, and the regulator will then increase the excitation of the machine under its control sufficiently to meet its own requirements and to allow it to supply a

magnetising current to the trailing machines. It will be seen from this that it is considered advisable to connect the regulator to the largest machine, due to the fact that the smaller machine will then only be required to supply the magnetising current when running on low loads, and this is assisted if the regulator is on the machine with the coarsest regulation, as the amount of magnetising current that is required for the trailing machines when on top load is less, due to the fine inherent regulation of these machines.

The conditions given above are very severe, as usually the plant is running with a certain amount of constant load with variation over and above this. It can be taken that under most conditions the best value of excitation for the trailing machines is a value corresponding to that required to give normal volts at a load equal to the constant load plus half the maximum variation. A large number of installations are in operation on the above system with the well-known Tirrill regulator, where it has been found possible to maintain the supply voltage within 1 per cent. Of course, one regulator can be used to control the supply of a number of alternators by making the regulator operate on a booster either in series with the fields of the exciters or the fields of the alternators, but these schemes have no advantages in cases as mentioned above, more especially if the exciter voltages differ, as all the machines are subjected to the same increase in voltage, which may be a larger percentage of one than of the other. For example, suppose the range of excitation voltage on the close regulated machines is 50 to 100 volts from no load to full load, and that of the coarser regulated machines 50 to 150. If all the fields are taken through a common booster, and the machines are running at the time at no load, and sufficient load is thrown on so that the regulator operates to make the booster give 50 volts, it would mean that the excitation voltage of the close regulated machines would be increased from 50 to 100 volts, i.e., full excitation, whereas the coarser regulated machine, which really required the greatest increase in excitation, has its excitation only increased from 50 to 100 volts, which is only two-thirds full excitation; greater discrepancies than these will occur if the values of the excitation voltages are wider apart than those given above.

The second award (5s.) is made to "W. H.," who writes substantially as "W. A. H.," and says:

The alternator or alternators controlled by the regulators (connected as already mentioned) will take all the variation in load, and their field currents will be automatically adjusted to suit the load and to give constant voltage. The generators under hand control will keep a constant load, and therefore a constant voltage, without any adjustment of the excitation current. In cases where large variations in load are met with, such that any similar machines in the station would not be together capable of dealing with them, the regulator is arranged to have sufficient relay contacts to deal with the exciters of all the alternators which are to be automatically regulated, and the connections to the exciter field resistances will be made so that at the average load each alternator is taking the correct field current. That portion of the field resistance of each exciter which is automatically cut "in" and "out" of circuit by the regulator contacts is then separately adjusted on each individual exciter, such that the corresponding alternator receives as closely as possible the correct excitation current for the various loads. Machines having bad regulation will have a greater proportion of the exciter field resistance operated on than will those machines having good regulation, thus giving in the former larger variations in field current. It will be understood that the excitation will be only approximately correct, and that the alternators will take a leading or lagging current from the bus-bars depending on whether the machines are over- or under-excited. There are variations in the methods outlined above, such as paralleling the exciters of similar machines on to exciter bus-bars, but they all use the same principle.

**Electricity v. Gas.**—Mr. C. H. Yeaman (Borough Electrical Engineer, Stoke-on-Trent) asks for suggestions for more or less reliable figures for comparison between gas and electric lighting with  $1\frac{1}{4}$ -watt lamps under existing conditions. He suggests that a fair comparison would be to take gas with a low-pressure mantle burner as giving a mean value of about 45-c.p. for 3 cub. ft. per hour. 60-c.p. with  $2\frac{1}{2}$  cub. ft. per hour is generally claimed, but a gas mantle falls to about two-thirds of its efficiency after about the first 100 hours. The gas engineer had stated, however, that he was prepared to guarantee 30-c.p. per cub. ft. of gas per hour.

**The "Northampton Gazette."**—The last issue of this official publication of the "Northampton" Past Day-Students' Association contains notes on the doings of several old students in this country and abroad. The latter are quite interesting. There is also a report of the address recently delivered by the President of the Association, Mr. H. K. Whitehorn. It is suggested that Past Students might make more use of the Appointments Bureau than they have in the past. It is pleasing to read in this connection that the Bureau is "constantly being offered openings of all kinds, electrical, mechanical, scientific, and literary, and usually is unable to find men."

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 40. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**MAZDA HALF-WATT LAMPS.**—This is a four-page leaflet sent by the British Thomson-Houston Co., Ltd. (77 Upper Thames Street, E.C.), giving the fullest information with regard to the sizes and prices of the Mazda half-watt lamps, illustrations, and prices of special lanterns and fittings designed for them, and also of lamp-holders.

**OSRAM HALF-WATT LAMPS.**—The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.) have issued a list of Osram half-watt lamps, embodying some of the particulars given in our article this week. A facsimile of the list appears in the advertisement pages in the centre of this issue. It will be noticed that a useful feature of this is a set of dimension diagrams.

**WOTAN HALF-WATT LAMPS.**—The pamphlets issued by Siemens Bros. Dynamo Works (Lamp and Fittings Department, Tyssen Street, Dalston, N.E.), are reviewed on a later page.

**THE NITRA LAMP.**—The Electrical Company, Ltd. (122-124 Charing Cross Road), have sent us a price list of their "Nitra" half-watt lamps and fittings. A description of the lamp appears on a later page.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**"E.C." JOURNAL.**—The first issue of this new monthly publication of The Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.) is now available, and is being sent to the company's customers. It contains references to the vast business carried by the A.E.G., which, as most of our readers know, is the parent company, and the allied companies. There are notes on the arrangement and equipment of the various factories, and articles on the "Half-Watt" lamp and prepayment meters. Curves are given showing the variation in the price of raw materials, electrolytic copper, spelter, tin, lead, Para rubber, and cotton, during December, as compared with December, 1912. A useful addition is a stock sheet of A.C. and D.C. motors in the London stock just prior to the day of publication. It is announced that the company is shortly to issue a bound price list of some 1,000 pages, 8½ in. by 5½. It will be a complete and concise combination of all the various sectional lists that have been lately issued. These are also being reprinted. The list will be sent to intending purchasers of The Electrical Company's goods, and the cover, which will be finished in dark brown linen, will have the recipient's name in gold lettering on it. Enclosed with the current issue of the "E.C." Journal is a clear 4-inch aluminium pocket rule, which is also divided into centimetres.

**MAGNET COILS.**—A leaflet just published by the British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), points out the advantages of magnet coils in which aluminium, protected only by the skin of oxide, is used.

**ALUMINIUM.**—Other leaflets from the same firm deal with aluminium netting and gauze, aluminium mandrils for rubber manufacturers, and the uses of aluminium in the automobile chassis.

### NEW YEAR SOUVENIRS, &c.

Simplex Conduits, Ltd., are always original in their ideas, and the Editor has this year received from them not only a copy of their useful pocket-book and diary, but a most ingenious pen and pencil rack, consisting of upright tubes standing up from the lid of a cast-iron box, and all similar to their well-known conduit material. The gift is complete with black, blue, and red pencils, indiarubber, and compass, and is most acceptable.

The General Electric Co., Ltd., has sent a refill for 1914 to be used in the useful desk calendar distributed to its friends last season.

A calendar with a delightfully humorous illustration is that issued by Pinchin, Johnson & Co., Ltd., well known to our readers as manufacturers of varnish for electrical purposes. A puppy who has upset a pail of bright-coloured colouring material is regarding the mess, and remarking, "I think I've got distemper."

### THE OSRAM HALF-WATT LAMP

THE Osram half-watt lamp is illustrated below. It is made in all the sizes mentioned on page 31, at a uniform efficiency of approximately half-a-watt per British candle power. The relative sizes of the bulb and filament are clearly shown in the illustration. For the 300 and 500-watt sizes the bulb is 5½ in. in diameter and 11½ in. long; the 1,000-watt size is 6½ in. in diameter and 12½ in. long; and the 1,500-watt size, 7½ in. in diameter and 14½ in. long. The filament consists of a continuous length of pure drawn tungsten wire formed into a series of spirals which are mounted as shown, and we are informed that its mechanical strength even surpasses that of the ordinary tungsten lamp. The bulb is filled with an inert gas such as nitrogen, and the high efficiency is due to the high temperature of the filament, which is about 500° F. higher than that of an ordinary tungsten lamp. At this temperature the light approaches to

sunlight in whiteness: the filament has an intrinsic brilliancy about eight times that of the ordinary tungsten filament, or twenty times that of the carbon lamp.

The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), state that exhaustive tests have shown that the average burning life of the half-watt Osram lamp is 1,000 hours, during which period the candle power is practically constant. The uniformity of the light distribution is excellent, as might be expected from the shape of the filament, and the ratio of mean spherical to maximum horizontal candle power actually averages 85 per cent. Moreover, the concentration of the filament in a small area assists the design of reflectors to give any required distribution.

As will have been gathered from the dimensions given above, the bulbs of the Osram half-watt lamps are smaller than those of ordinary tungsten lamps of the same wattage, but it is claimed, nevertheless, that there is hardly any loss of candle power due to blackening, as any deposit which forms merely coats the upper part of the lamp, owing to the convection currents.

During some time past the Osram Lamp Works have been busy manufacturing, and the General Electric Co. had, at any rate on Monday, when the lamp appeared on the market, a large stock in hand ready for delivery. Central station engineers on Monday were offered small quantities delivered immediately, if ordered by return of post, and were informed that the works had now a considerable and rapidly increasing output of these lamps. In ordering lamps it should be stated whether they are for series burning, as, for this, only lamps with the same series number marked on them should be run together. Harrod's Stores, presumably by special favour, have already some Osram half-watt lamps in use.

### THE MAZDA HALF-WATT LAMP

THE advent of the half-watt lamp—an almost revolutionary development in incandescent electric lamp manufacture—was announced by the British Thomson-Houston Co., Ltd., towards the end of last August. Specimens of the lamp were then exhibited, for the first time in this country, at the Company's London Offices, Mazda House, 77 Upper Thames Street, E.C. An account of the demonstration and a description of the lamp was published in ELECTRICAL ENGINEERING on August 28th and September 4th.

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

FIG. 5.

FIG. 1.—1,000 c.p. 100-volt. Mazda "Half-Watt" lamp. FIG. 2.—Special weatherproof fitting for Mazda "Half-Watt" lamps. (This fitting can also be supplied without reflector. It is finished in durable black stove enamel, and is properly ventilated.) FIG. 3.—Special Mazda "Half-Watt" fitting equipped with Alba glass sphere. FIG. 4.—Alba semi-indirect lighting fitting, specially designed for use with Mazda "Half-Watt" lamps. FIG. 5.—Store fitting for use with Mazda "Half-Watt" lamps in shops, &c. (This fitting consists of a dome made of opalescent glass, covered on the under side with a cut glass bowl supported by a hinged ring.)

The preliminary announcement of the Mazda half-watt lamp aroused, as it deserved to do, a tremendous amount of public interest, and we are informed that since August inquiries on the subject have been pouring into Mazda House. The British Thomson-Houston Co. now state that they have completely standardised the production of these lamps at their Rugby factory, and are in a position to accept orders for them.

Below is a brief tabulation of the chief features of the Mazda half-watt lamp, as put forward by the makers:—

*Efficiency.*—Half-watt per candle, or two candles per watt.

*Average Useful Life.*—800 to 1,000 hours.

*Quality of Light.*—Owing to the high temperature of the filament, the light is much whiter in colour than that of the ordinary tungsten lamp, and approximates very closely to daylight.

*Intrinsic Brilliancy.*—The intrinsic brilliancy of the Mazda "Half-Watt" lamp is eight times as high as that of the ordinary tungsten lamp. For interior lighting this high intrinsic brilliancy renders it essential that Mazda half-watt lamps should be enclosed in suitable diffusing spheres or bowls in order that the light may be agreeably diffused and effectively distributed.

The sizes in which the Mazda half-watt lamp is available are given on page 31.

The bulb of the lamp, instead of enclosing an almost perfect vacuum, is filled with an inert gas such as nitrogen.

The use of a gas-filled bulb and a special form of drawn-wire tungsten filament, wound in a close spiral and mounted in short loops, are the constructional features chiefly responsible for the high efficiency of the new lamp. The Company point out that this epoch-making advance in lamp efficiency was only rendered possible by the invention of the drawn-wire tungsten filament, which was also a Mazda development, and is covered by fundamental patents owned by the British Thomson-Houston Co., Ltd.

With the placing on the market of the half-watt lamp there is now available a range of Mazda lamps in sizes from 1 c.p. to 3,000 c.p., suitable for all commercial voltages, and applicable to every conceivable lighting purpose.

In addition to the Mazda half-watt lamp, the British Thomson-Houston Co. have developed a range of special fittings for use therewith. For outdoor purposes—the lighting of streets, shop-fronts and open spaces—some very effective weatherproof lanterns, fitted with reflectors and opalescent globes, have been designed. As already stated, the high intrinsic brilliancy of the Mazda half-watt lamp makes the use of diffusing globes and bowls very desirable for interior lighting, and the Company have accordingly designed a number of fittings equipped with their well-known Alba and Veluria glassware. The half-watt lamp is, of course, specially adapted to indirect and semi-indirect lighting, with which systems the British Thomson-Houston Co. have identified themselves so closely. Undoubtedly the new lamp will very considerably increase the vogue of these forms of illumination.

The makers also look forward to a wide sale of the lamp for displacing the arc lamp and the high-pressure gas lamp for outside lighting.

Further information and prices of Mazda half-watt lamps and fittings will be found in the B.T.H. Co.'s price list No. 11,000, for copies of which readers are invited to write to Mazda House, 77 Upper Thames Street, E.C.

**The "Z" Half-Watt Lamp.**—The "Z" Electric Lamp Manufacturing Co., Ltd. (Oriel House, Cannon Street), have placed a series of half-watt lamps on the market, of the sizes given on page 31.

**Drake & Gorham.**—Messrs. Drake & Gorham, Ltd. (1 Felix Street, S.W.), inform us that they are supplying half-watt lamps of all makes on their usual terms. They have already put in four 1,000-watt lamps at Epsom for street lighting.

**Advertising Electricity Supply.**—The Ipswich Corporation, Electric Supply and Tramways Departments, have some neatly designed postcards for sending to prospective consumers. Of these, one is boldly arranged so as to call attention to the safety of electricity as regards fire; and another explains the simple control, and concludes with a reference to the Department's rental wiring system. A series of bookmarkers, issued with the Free Library books, deal each with one of the good points of electricity in the home.

### THE ROYAL EDISWAN HALF-WATT LAMP

THE Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), in bringing to the notice of their customers the Royal Ediswan half-watt lamp, state that these lamps will be offered in the following sizes for the present:—

Volts.	Watts.	C.P.
50-65	300	600
" "	500	1000
" "	1000	2000
" "	1500	3000
100-130	500	1000
" "	1000	2000
" "	1500	3000
200-250	1000	2000
" "	1500	3000

It will be seen that two sizes, 1,000 and 1,500-watt at 50-65 volts, are included, in addition to those tabulated on page 31.

They also recommend their customers to obtain the special lantern fittings with reflectors and globes for use with this class of lamp, especially when the lamp is used for outside lighting. The smaller candle power lamps of this type are quite suitable for inside shop-lighting, and wherever a strong light is required.

The Edison & Swan Co. have installed some of these lamps at their showrooms at College Hill, and at their Queen Street offices, for their customers to judge of the general appearance and effect of this class of lamp.

### THE WOTAN HALF-WATT LAMP

SIEMENS BROS. DYNAMO WORKS, LTD. (Lamp and Fittings Department, Tyssen Street, Dalston), embody the particulars of their Wotan half-watt lamps and lanterns in two small, neatly printed pamphlets. Some particulars of these lamps appeared in our columns on December 18th, and the sizes are those which appear on page 31 of our present issue. The shape of the lamp is shown in the illustration below, and it will be seen that it is slightly longer in the neck than some of the other makes.

In their pamphlet, the company state that the candle-power of Wotan half-watt lamps is taken, not as in the case of lamps of the one watt per c.p. type on the horizontal c.p., but on the

WOTAN 2000 C.P. 200/260  
VOLT "HALF-WATT" LAMP.  
Scale: About one-fifth full size.

"GATESHEAD" WEATHER-  
PROOF LANTERN.

average c.p. in all directions below the horizontal, i.e., it may be considered as the useful c.p. obtained without the help of a reflector.

As regards perfection in manufacture, strength, and durability, the Wotan half-watt lamp is identical with the standard types of Wotan lamps at present on the market. Perhaps the most interesting features of the new lamps are the novel arrangement of the filament, the fact that the bulb is filled with an inert gas, and its extremely low current consumption.

Wotan half-watt lamps, the pamphlet continues, give a powerful illumination closely approaching strong sunlight, the similarity extending not only to the appearance of the illumination, but also to the "spectrum" of the light emitted. The

whiteness of the light given, together with the mechanical strength of the lamps, should ultimately secure their universal adoption for the lighting of large areas, photographic studios, &c., &c.

We illustrate one of the many types of lanterns recommended by the company for half-watt lamps.

### THE NITRA LAMP

THIS is the name given by the Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.), to their half-watt lamp. The voltages and candle powers are the same as those given on page 31, but it will be seen from the illustrations below that the lamp has one very distinctive feature—there is no "pip." Another difference is the absence of the shoulder near the cap. The bulbs have long necks, and, except in the 300- and 500-watt sizes, are very much larger than those of other makes. The 1,000-watt lamp is  $7\frac{1}{8}$  in. in diameter and  $17\frac{1}{4}$  in. long, and the 1,500-watt lamp is  $9\frac{1}{8}$  in. in diameter and  $19\frac{1}{4}$  in. long. Nevertheless, the

NITRA LAMP.

NITRA LAMP IN SPECIAL  
REFLECTOR LANTERN.

bulbs are still smaller in diameter than those of ordinary (1-watt) high candle-power tungsten lamps. The object in placing the cap as far as possible from the bulb is to keep the heating down to a minimum. It is claimed that the mechanical fixing of the cap is such that loosening is impossible, even if the cement breaks away after long use. The bulbs are filled with nitrogen slightly below atmospheric pressure, viz., at 9 lb. per sq. in. Curves of light distribution were published in our issue of January 1st. The Nitra lamp has been in actual use in Berlin since September, and has been used for lighting the Tiergarten and the Kurfürsten Opera in that city. It is said to have a useful life of approximately 800 hours.

### "PRANA" DIE-CASTINGS.

We here illustrate two sections of "Prana" Alloys which are not only (as can be seen) entirely free from blow holes, but do not distort or disintegrate.

Write for Leaflet E E 3.

AERATORS, Ltd., EDMONTON, LONDON.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Dorking.**—Mains extensions (£2,000).

**Dublin.**—An expenditure of £15,000 is contemplated in the financial year 1914-15 upon new mains, services, meters, &c. In addition, an expenditure of £3,258 is recommended for the reconstruction of the Pigeon House Fort power station switch-boards.

**Guildford.**—Barometric condensing plant, capable of dealing with 15,000 lbs. of steam per hour. Guildford Electricity Supply Co.

**Leigh (Lancs.).**—Extensions to generating plant (£12,000).

**London: Hackney.**—Various mains extensions are contemplated.

**St. Marylebone.**—Twelve months' supply of stores, including wood troughing, meter boards, casings, underground cables, house cables, flexible cords, box compound, and insulating materials, &c. Borough Electrical Engineer, February 11th. (See an advertisement on another page).

**St. Pancras.**—The Borough Electrical Engineer has reported upon additional extensions at the King's Road station, estimated to cost £51,218. He calculates that a saving of £12,000 per annum will be made when this new plant is in full operation. The details of the new plant are as follows:—Buildings, &c., £20,298; coal handling plant, &c., £3,190; four boilers, &c., £22,530; condensing pipes and pump accommodation, £2,200; railway sidings, £1,900; contingencies, £1,100. The Council has already sanctioned a new turbine at an estimated cost of £15,000.

**Lytham.**—The Council has decided to apply for a loan of £23,700 for its electric lighting scheme.

**Monmouth.**—A loan of £1,800 for new cables is to be applied for.

**New Zealand.**—The Napier Council proposes to spend £2,500 upon mains extensions.

**Shipley.**—A L.G.B. inquiry has been held concerning a loan of £27,000 for new plant and cables.

**Wakefield.**—A L.G.B. inquiry was held last week concerning a loan of £13,000 for new plant and mains.

**Walsall.**—The Corporation has decided to proceed with the new power station scheme designed by its consulting engineer, Mr. E. M. Lacey, and as a first step, the necessary land is to be acquired.

Mains extensions at an estimated cost of about £600 are to be carried out.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Barnet.**—New Council offices.

**Blackpool.**—Hotel, £250,000. New school for 900 children.

**Bournemouth.**—New pavilion (£60,000).

**Bridlington.**—Workmen's housing scheme (£3,150).

**Broadstairs.**—New school. Kent Education Committee.

**Caister.**—Electric lighting of workhouse. Clerk to Guardians.

**Chester.**—Garden village consisting of 180 houses.

**Dewsbury.**—Proposal to electrically light all Council schools.

**Doncaster.**—Cinematograph theatre, St. Sepulchre Gate.

**Hertford.**—New County Council school. County Surveyor, Hatfield.

**Llandudno.**—New cinematograph theatre.

**Manchester.**—40 points, lighting, heating and cooking, private house. 15 High Street, Chorlton-cum-Hardy.

**Middleton.**—New Town Hall.

**Northwich.**—Forty-eight workmen's cottages (£8,500). Town Clerk.

**Widnes.**—Additions to hospital.

### Miscellaneous

**Belfast.**—Tenders are invited for annual supplies, including electrical sundries, for the Electricity and Tramways Departments.

**Cheltenham.**—Twelve months' supply of electric lighting fittings. Borough Engineer, January 31st.

**Harwich.**—Some electrical plant is required at the pumping station of the Corporation at an estimated cost of £245.

**Kirkcaldy.**—An expenditure of £3,000 upon new tramcars is contemplated.

**New Zealand.**—The Napier Council proposes to spend £3,000 upon new tramcars, &c.

**Wolverhampton.**—One boiler feed-pump. Borough Electrical Engineer. January 26th. (See advertisement on another page.)

## TENDERS RECEIVED AND ACCEPTED

**Aberdeen.**—A contract has been placed with Messrs. T. C. Smith & Co. for the provision of forty-six additional lamps for street lighting purposes in the Ballater district, bringing up the total number of lamps to the 1,500 guaranteed by the Corporation.

**Bournemouth.**—The tender of the British Westinghouse Co. has been accepted for the electric lighting of the Undercliff Drive.

**Manchester.**—The following tenders have been accepted:—Traction storage battery, Chloride Electrical Storage Co.; reversible booster, regulator and switchgear, Lancashire Dynamo & Motor Co.; cable, Electrical Engineering & Equipment Co.; two 500-k.v.a. static transformers, Siemens Bros. Dynamo Works, Ltd.; two 300-kw. rotary converters, British Westinghouse Co.; metal filament traction lamps, Drake and Gorham.

**Rathmines.**—Contracts have been placed with Messrs. Bellis and Morcom and the British Westinghouse Co. for two 200-kw. generating sets. The total price is £1,003.

**Southport.**—The Corporation has accepted the tender of the British Westinghouse Co. for an alternator at £1,920.

The Edison & Swan United Electric Light Co. has secured contracts for the supply of Royal Ediswan Lamps to the Cunard Steamship Co., Elder, Dempster & Co., and Cammell, Laird & Co.

## APPOINTMENTS AND PERSONAL NOTES

By an unfortunate error, we referred in our last issue to Mr. Cyril Clarke as the Borough Electrical Engineer at Birkenhead. This was not correct. Mr. Cyril Clarke has been appointed Tramways Manager at Birkenhead in succession to Mr. W. Wyld (who was appointed Chief Electrical Engineer at Hampstead last year). The salary is at the rate of £350 per annum, rising £25 yearly to £450. On Mr. Wyld's resignation from Birkenhead, the dual position of Borough Electrical Engineer and Tramways Manager was abandoned, and Mr. G. P. Shallcross was appointed Borough Electrical Engineer.

Mr. David Tattersall has resigned his position as Engineer and Secretary to the Ingleton Electric Lighting & Power Co., and is taking up the position of Mains Engineer with the Hindhead & District Electric Light Co. Mr. W. G. Hurst, late Chief Assistant at the Heckmonkwiike Electric Supply Station, has been appointed to succeed Mr. Tattersall.

The Chesterfield Corporation is recommended to increase the salary of Mr. R. L. Acland to £500 per annum, representing £350 as Electrical Engineer, and £150 as Tramways Manager.

The Portrush District Council requires an electrical engineer to take charge of the electricity works which are shortly to be erected. Applications to Town Clerk by January 31st.

An assistant is required in the street lighting department of a Midland municipality. (See advertisement on another page.)

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published January 8th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**

28,945/12. **Analysis of Gaseous Mixtures.** SIEMENS BROS. & Co. (*Siemens & Halske*). The density of a gas of known constituents is compared with that of a standard gas on a single instrument. The pressure difference required to produce a certain acceleration in the gaseous mixture acts on a lever, or sliding contacts are caused to vary the resistance in an electrical circuit as the gas pressure varies. The indicating instrument is of the d'Arsonval type, with two coils. Four figures.

29,338/12. **Pressure Regulation of Rotary Converters.** SIEMENS DYNAMO WORKS and J. C. WILSON. The exciter shunt field winding is in series with a resistance controlled by an automatic regulator with its coils connected on the D.C. side of the set. One figure.

29,389/12. **Refractory Material for Radiators or Furnaces.** B.T.-H. Co. (*G.E.Co., U.S.A.*). Silica, carbon, and an aluminium silicate with or without manganese oxide is heated in a "smothered arc" furnace until reduction takes place. A sublimate is formed and condensed in a housing round the furnace. The product will stand compression without much loss of its heat insulating properties. The proportions of the constituents used are approximately 4:2:4:1.

2,001/13. **Drawing Tungsten Wires.** B.T.-H. Co. (*G.E.Co., U.S.A.*). A liquid lubricant, comprising an aqueous suspension of finely divided graphite containing a binding material, such as glucose, sufficient to cause the graphite to adhere firmly to the wire, is used. The wire is lubricated by the application of the lubricant, which is then carbonised by the heat of a gas flame, so as to cause the adhesion of the lubricant.

2,901/13. **Incandescent Lamps.** B.T.-H. Co. (*G.E.Co., U.S.A.*). To prevent blackening of incandescent lamps, cryolite, a double fluoride of sodium and aluminium, is ground to a powder; made into a paste and applied to a part of the lamp interior, where a temperature of between 300° C. and 800° C. is attained during normal burning. The claims cover the use of a double halogeneous salt or compound of aluminium and an alkaline metal or alkaline earth metal, including a double fluoride of aluminium and an alkaline metal.

5,448/13. **Vapour Rectifiers.** B.T.-H. Co. (*G.E.Co., U.S.A.*). The rectifier claimed comprises communicating evacuated metallic chambers, one or more anodes in one of these and a mercury cathode in the adjoining chamber. There is a vacuum tight insulating seal between the chambers, at a point well removed from the cathode. A barrier of insulating material lines the cathode chamber, overlaps the seal, and encloses the active part of the cathode. The insulation is shielded from the direct heat of the arc by a wall of metal. Three figures.

6,143/13. **Incandescent Lamps.** H. ZSCHOCKE. Zig-zag metallic filaments are passed over non-conducting supporting arms, constructed preferably of glass or porcelain, and provided with a groove or with a grooved boss or head to receive the filament. These arms may be used at one end of the stem and metallic double spiral arms at the other. By this construction the filament is not bent too sharply. Six figures.

11,267/13. **Circuit Regulation.** SIEMENS DYNAMO WORKS (*Siemens-Schuckert*). There is used an auxiliary circuit in which a voltage may be varied down to zero, and when this voltage is approximately zero the connections of this circuit to the main circuit are bridged so that the reversal of the auxiliary pressure is facilitated. As an example, an A.C. circuit is fed by a transformer with tapplings, while there is also a tapped transformer in the auxiliary circuit combined with an induction regulator in series, giving a maximum pressure equal to that between two adjacent tapplings on the auxiliary transformer. The connections of the induction regulator are reversed, and at the same time connected with a further step of the auxiliary transformer. This and the induction regulator are reversed as a single unit. Four figures.

15,769/13. **Supplying Low-Pressure Current from High-Pressure Mains.** E. A. GRAHAM and W. J. RICKETS. A storage battery and breaking-down resistance are used. The battery charging circuit is closed through a relay controlled by another relay adapted to establish or remove a virtual short-circuit across it. The latter relay is controlled by the battery pressure and the former is arranged to have a bias in favour of positive action of the latter. The biasing may be obtained by a resistance normally in series with both relays, or a demagnetising winding may be arranged on the second relay. Five figures.

23,728/13. **Antennæ for Aeroplanes.** SIGNAL GRS. A bamboo mast is inserted into a steel tube built into the aeroplane frame near its centre of gravity. The upper end of the tube projects slightly above the wing planes. One figure.

## Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Dynamos, Motors and Transformers:** B.T.-H. Co. and WHITAKER [Regulation of rotary-converters] 26,899/12; [Amortisseur windings for synchronous machines] 9,685/13; Soc. S.T.A.R. (SYSTÈME DE TRACTION AUTO-RÉGULATEUR) 29,522/12; SIEMENS-SCHUCKERT. [Geared A.C. motors] 24,126/13.

**Electrochemistry:** DENNY [Ozone generators] 4,355/13.  
**Heating and Cooking:** RAILING and GARRARD, 29,763/12; IDE [Detachable immersion heater] 29,879/12.

**Ignition:** MAY [Igniters] 29,613/12; LAWRENCE [Ignition generators] 29,620/12.

**Incandescent Lamps:** TRENZEN [Making non-ductile metals ductile] 26,800/12.

**Storage Batteries:** HEAP and CHLORIDE ELEC. STORAGE Co., 29,456/12.

**Switchgear, Fuses and Fittings:** BAERLOCHER and ALLEN WEST & Co. [Working liquid controllers] 29,461/12; LUCAS and EDWARDS [Couplings for use in motor road vehicles] 29,809/12; RAUSCH [Time alarms] 4,638/13; HART and ANCHOR CABLE Co. [Earthing clips for metallic covered cables] 9,463/13; FAGERLUND [Switches] 13,654/13; HUTTON [Lighting indicator] 13,660/13.

**Telephony and Telegraphy:** SHEPARD and MCKECHNIE [Wireless] 21,743/12; AUTO. TELEPHONE MFG. Co. (*Auto. Elec. Co., U.S.A.*) [Telephone systems] 29,351/12, 29,352/12, 29,353/12, 29,354/12, 29,355/12, 29,356/12, 29,358/12, 29,359/12, and 29,360/12; ARNOLD [Method of reproducing electric variations] 29,384/12; BARONIO and WOOD [Telegraphic receivers for actuating perforators or typewriters] 29,416/12; SIEMENS BROS. and PRITTIGREW [Automatic switching apparatus connected over junction-lines with a manual exchange] 29,721/12; MARCONI Co. and GRAY [Masts for wireless] 24,148/13.

**Traction:** MASCHINENFABRIK OERLIKON [Switch and point operating mechanism] 15,062/13.

**Miscellaneous:** ELEC. HAMMERS, LTD., and SCOTT [Portable hammers for rivetting, caulking, &c.] 24,090/12; EVANS [Remote control of gun sights and guns, order telegraphs, &c.] 29,376/12; ROYER [Self-propelling torpedoes] 7,501/13; HEINS [Substitution resistances for lamps] 9,530/13 and 10,018/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** Soc. ANON. DES AUTOMOBILES AND CYCLES PEUGEOT [Safety apparatus for lighting installations] 21,445/13.

**Dynamos:** PEDERSEN [High frequency] 28,839/13.

**Electrometallurgy and Electrochemistry:** Soc. GEN. DES NITRURES [Manufacture of aluminium nitride] 21,366/13; [Furnaces for manufacture of aluminium nitride] 24,347/13; BRONN [Protecting the electrodes in arc furnaces] 29,259/13.

**Incandescent Lamps:** KLEIN [Lamp for advertisements or signalling] 29,284/13.

**Switchgear, Fuses and Fittings:** YOUNG [Fuses] 27,641/13.

**Telephony:** SIEMENS & HALSKE, 29,049/13 and 29,426/13; VAN KESTEREN [Repeater systems] 29,165/13.

**Miscellaneous:** MASCHINENFABRIK OERLIKON [Electro-hydraulic presses] 26,340/13.

## Appeal from Comptroller's Decision

8,040/12. **Variable Speed Dynamos.** C. A. VANDERVELL and A. H. MIDGLEY. An appeal has been lodged by the opposers from the Comptroller's decision to grant this patent.

## Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** S. R. EVANS [Incombustible sleeve fixed to flexible just above cord grip to prevent flame spreading upwards in the case of a short circuit in the socket] 21,308/06.

**Dynamos, Motors and Transformers:** A.E.G. [A.C. commutator motors] 18,372/08.

**Electrochemistry and Electrometallurgy:** G. J. ATKINS [Electrodes of carbon impregnated with oil] 21,021/02.

**Switchgear, Fuses and Fittings:** A. P. LUNDBERG, G. C. LUNDBERG, and P. A. LUNDBERG [Selective plugs: a pin in the socket engages a hole in split plug] 21,391/06.

**Telephony and Telegraphy:** A. M. BELLARD and M. C. RORTY [Automatic telephone exchange system] 20,739/02.

**Miscellaneous:** J. ZEITLIN [Multi-stage vacuum pump] 21,337/06; E. KLUPATHY and C. BERGER [Torpedoes] 19,825/08.

### HALF-WATT STREET LIGHTING AT EPSOM

JUST as we go to press the illustration below has come to hand. It is from a photograph taken by Messrs. Drake & Gorham on Tuesday night, showing the street at Epsom, which is lighted with four 2,000 c.p. half-watt lamps. With characteristic enterprise, Messrs. Drake & Gorham have

completed this in record time. The order was only given midday on Monday, the fittings were erected the same day, and the lamps were alight on Tuesday, and the block was sent to us by 10 o'clock yesterday morning.

### LOCAL NOTES

**Birmingham:** *Birmingham and Midland Institute Conversation.*—The Electric Supply Publicity Committee are exhibiting "The Electric House" at Birmingham during this week, at the Birmingham and Midland Institute Conversation. This exhibit is substantially a replica of that shown with such success at the recent Ideal Home Exhibition. The Birmingham Corporation Electricity Department, which is interested in this exhibit, is to be congratulated upon its enterprise, as Birmingham is the first provincial city in which it has been shown.

**Carnarvon:** *Free Wiring Agreements.*—A short time ago the Council took over from the National Electric Construction Co. the free wiring agreements in Carnarvon which that Company had entered into. A discussion took place at the last meeting of the Council upon a report from the Town Clerk dealing with these agreements, in the course of which it was stated that in the case of a large percentage of them there was very little, if any, income to meet the liability attached to them. A motion that no further agreements of this character be entered into was the subject of some divergent views, and eventually the whole question was referred back to the Electricity Committee.

**Chiswick:** *Proposed Purchase of Supply Co.*—The proposal of the Council to purchase the Chiswick Electricity Supply Corporation, Ltd., has been rejected by a ratepayers' meeting.

**Dumbarton:** *Bulk Supply.*—It is stated that the Clyde Valley Electrical Power Co. is entering into an arrangement with the Electric Supply Corporation, which distributes in Dumbarton, to give a bulk supply.

**London:** *Islington: Bulk Supply Scheme.*—Mr. A. Gay, Chief Electrical Engineer to the Council, who, we are pleased to hear, has now recovered from his long spell of ill-health, speaking at the Annual Dinner of the Council's electricity employees last week, expressed the hope that any alteration in the present arrangements of London supply, as foreshadowed by the proposed bill next session, would not be granted by Parliament. Mr. Gay and Mr. Macalister, his chief assistant, both believe that under present conditions, with a large number of power stations, London is more

immune from serious breakdowns in the supply of electrical energy than would be the case if there were only two or three large power stations. They both prefer that a linking-up scheme between the existing districts should be developed rather than that a big company should be allowed to take over the supply to the whole of London.

**St. Pancras.**—In reporting upon the possibilities contained in the County of London Electric Supply Co.'s Bill, the Borough Electrical Engineer states that, provided any "bulk" supply offer is based on correct data and similar conditions as to load, coal value, repayment of capital, &c., the St. Pancras power stations can yield as good or even better results than any power station likely to be erected by a company, inasmuch as the demand in St. Pancras is sufficiently extensive to enable the employment of as large generating sets as could be used elsewhere. The total cost of production under the Council's scheme (referred to in our "Tenders Invited" column) is 0.3962d. per unit, including capital charges, on an output of 14,500,000 units.

**Manchester:** *Purchase of Trafford Park Co.*—A deputation from the Manchester Ratepayers' Association waited upon the Lord Mayor last week to protest against the purchase of the Trafford Power & Light Supply Co., Ltd., which, as we have already announced, the Council take powers to do under its bill next session. The reason for the objection is that the Supply Co. is not a paying concern, and that, although the capital powers asked for by the Corporation in connection with this scheme only amount to £250,000, it is believed that something like £1,000,000 will be necessary eventually.

**Monmouth:** *Proposed Sale of Electricity Undertaking.*—During the discussion upon the position of the electricity undertaking last week, when it was decided to borrow £1,800 for mains extensions (see "Tenders Invited" column), a resolution was moved that the undertaking should be sold. Only the mover and seconder, however, voted in favour.

**Penmaenmawr:** *Electric Lighting.*—The North Wales Power and Traction Co. has offered to supply the Council with current in "bulk" on a seven years' contract, at the rate of 1½d. per unit up to 24,000 units per annum, and 1d. per unit for all beyond that quantity. The minimum payment for the first two years, it is suggested, should be £120, and £150 for the remaining five years.

**Pwllheli:** *Electric Supply.*—The Council has approached the North Wales Power and Traction Co. with a view to instituting a supply of electrical energy in that town.

**Redditch:** *Proposed Sale of Electricity Undertaking.*—A request from the Ratepayers' Association to call a town's meeting or take a poll in order to ascertain opinions as to the desirability of selling the electricity undertaking, has been referred to the Electricity Committee.

**Swansea:** *Supply for Electric Vehicles.*—The Borough Electrical Engineer has been instructed to report on the question of supplying electrical energy for electric vehicles.

**Whitstable:** *Electric Supply.*—The new Whitstable Electric Supply Co. expect to be in a position to give a supply of current in five or six weeks time. Practically all the capital has been subscribed locally.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £65 10s. to £66 (last week, £67 to £67 10s.).

**Agency.**—An agent in St. Malo (France) desires to obtain the representation of United Kingdom manufacturers of electrical plant. Further particulars at 73 Basinghall Street, E.C.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**German Edison Accumulator Co.**—The Akkumulatorenfabrik, Akt. Ges., Berlin-Hagen, have purchased the undertaking of the German Edison Accumulator Company for a sum of £62,500, equal to half the paid-up capital of the latter company.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

A BRIEF *résumé* is given of the arrangements made on January 1st for the taking over by the Compagnie Parisienne de Distribution d'Electricité of the six companies supplying electricity in Paris. The maximum price of current for lighting per hectowatt-hour has been reduced from 7 centimes to 5 centimes. (Page 44.)

A LONG-BURNING flame-arc lamp, in which the upper electrode is a piece of untreated carbon 2 in. by 2½ in., is being put on the market in America. It burns for 200 hours per trim. (Page 44.)

We give the terms of the new working rules suggested by the Electrical Trades Union which are intended to come into force on January 24th. If the masters maintain their firm attitude, however, no serious strike is likely to occur. The electrical wiring trade is also likely to be seriously affected by the lock-out in the building trade threatened on Saturday. (Page 45.)

THE use of the lead covering of three-phase power cables for single-phase lighting is dealt with in our Questions and Answers column. (Page 46.)

In his Address as Chairman of the "Point Fives," on Friday last, Mr. A. H. Seabrook explained his conversion from the "connected load" to the "rateable value" system for fixing the primary charge for resi-

 **BINDING "ELECTRICAL ENGINEERING."**—Vol. IX. of "Electrical Engineering" (Jan.—Dec. 1913) closed with our issue of December 25th, 1913. Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to THE KILOWATT PUBLISHING CO., LTD., Temple Chambers, London, E.C., carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad. Binding Cases (including index, but not including binding) 2s. each, or post free 2s. 4d. (Abroad 2s. 6d.) Index alone, 1d. (Post free 2d.).

dence electricity supply. By choosing a suitable percentage on the rateable value, this system can be used for any class of property, still keeping the secondary charge at ½d. per unit for all purposes. If unable to charge ½d. per unit for heating and cooking when this is the competitive market price, it is better, said Mr. Seabrook, to charge 3d. and keep off the business. (Page 46.)

We publish further letters from supply station engineers in various parts of the country with regard to the prospects of the half-watt lamp in their districts. The general tone is one of warm welcome; there will soon be very little use now for incandescent gas lighting for large shop front lanterns or for street lighting. A few of our correspondents, however, are nervous as to the cost of renewals for the latter purpose, and hope for cheaper lamps. (Page 47.)

THE important subject of overhead line construction for medium and low pressures was dealt with by Mr. A. P. Trotter in a Paper before the Institution of Post Office Engineers. The author illustrated the guard devices which have been developed by the electrical engineers of Dudley, Sale, Accrington, and Rawtenstall. In all cases earthed cross-wires or their equivalent are provided. (Page 49.)

A PATENT for carbon switch contacts in the name of A. Reichwald expires during the week after a full life of 14 years.—Among the specifications published last week is one by C. Trenzen for the manufacture of ductile tungsten for drawn incandescent lamp filaments. Another relates to liquid controllers, in which the height of liquid is kept constant. This is by R. F. Baerlocher and Allen West & Co. (Page 51.)

THE London County Council has decided to accept the recommendations of the Select Committee of the House of Commons on Traffic with regard to a new traffic authority for London.—We describe the train lighting system of the Tudor Accumulator Co.—Petrol-driven trams are being experimented with on the Hastings sea front in substitution for the Dolter surface-contact system. (Page 50.)

ON vessels making international voyages of over 150 miles, and carrying 50 persons or more, wireless in-

stallations are to be compulsory. These and other regulations have been made by the International Conference on Safety of Life at Sea. Continuous watches are also to be kept in the wireless telegraph rooms of larger vessels. (Page 50.)

A NEW fitting for "half-watt" lamps, a substantial stage lighting plug, an illuminated hoarding, some new types of drawn tungsten wire battery lamps, and a central suspension lighting arrangement using trolley poles, are among the new appliances dealt with on pages 52 to 54.

New plant is required at Dorking (£2,000); Paarl, S.A. (£35,000); and Loughborough (£14,000).—Mains extensions are contemplated at Wolverhampton (£450); electrical supplies at Leeds and Birmingham; voltage control apparatus at Hackney; and laundry machinery at Dundalk.—Considerable discussion has arisen on the recommendation of the Bradford Electricity Committee that the tender of a Berlin firm for a 5,000 kw. turbo-alternator be accepted. (Page 54.)

THE Edinburgh Electricity Committee desires to increase its reserve fund to 15 per cent. of the capital expenditure.—The 9,000-kw. Lake Coleridge power plant (N.Z.) has been started up.—The Carlisle Electricity Committee resents a proposition by the Gas Committee that there should be no competition in the matter of price.—The London Borough Councils are proposing to oppose the County of London Electric Supply Company's Bill collectively.—A new 2,000-kw. turbo-alternator has been started up at Worcester. (Page 56.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JANUARY 22ND.

*Institution of Electrical Engineers.*

8 p.m. Fifth Kelvin Lecture by Sir Oliver Lodge, F.R.S., "The Electrification of the Atmosphere."

FRIDAY, JANUARY 23RD.

*Physical Society.*

5 p.m. At Imperial College of Science. The Agenda includes an Exhibition of a Water Model of the Musical Arc by W. Duddell, F.R.S.

MONDAY, JANUARY 26TH.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. At Armstrong College of Science. "Reactance and Reactance Coils in Power Circuits," by E. P. Hollis.

TUESDAY, JANUARY 27TH.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At University. "Electric Train Lighting Systems," by T. Ferguson.

WEDNESDAY, JANUARY 28TH.

*Institution of Electrical Engineers: Birmingham Section.*

7.30 p.m. At University. "Electric Train Lighting Systems," by T. Ferguson.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. At Victoria Embankment. "Recent Advances in Portable Wireless Telegraph Apparatus," with Demonstrations by P. R. Coursey.

FRIDAY, JANUARY 30TH.

*Institution of Electrical Engineers: Newcastle Section.*

7 p.m. At Hugh Bell School, Middlesbrough. "Reactance and Reactance Coils in Power Circuits," by E. P. Hollis.

## The London Electrical Engineers.

(TO-DAY) THURSDAY, JAN. 22ND.—C. Company. Technical Instruction 7 to 10 p.m.

FRIDAY, JAN. 23RD.—D. Company. Technical Instruction, 7.30 to 9.30 p.m.

SATURDAY, JAN. 24TH.—Headquarters open from 10 a.m. till noon

MONDAY, JAN. 26TH.—A. Company. Technical Instruction, 7 to 10 p.m.

TUESDAY, JAN. 27TH.—B. Company. Technical Instruction, 7 to 10 p.m.

WEDNESDAY, JAN. 28TH.—Recruits only. Infantry Drill and Technical Instruction, 7 to 10 p.m.

THURSDAY, JAN. 29TH.—C. Company. Technical Instruction, 7 to 10 p.m.

FRIDAY, JAN. 30TH.—D. Company. Special Class on Crossley Engine, 7 to 8 p.m. Technical Instruction, 7.30 to 9.30 p.m.

SATURDAY, JAN. 31ST.—Headquarters open from 10 a.m. till noon.

## CONSOLIDATION OF ELECTRIC SUPPLY IN PARIS

IN view of the prominence that has been given of late to the question of consolidating London's electric supply, it is interesting to record that on January 1st the consolidation of the supply of Paris under one authority, named the Compagnie Parisienne de Distribution d'Electricité, was actually effected by this Company taking over the undertakings formerly owned by the following six Companies:—La Compagnie Electrique du Secteur de la Rive Gauche de Paris, La Compagnie Parisienne de l'Air comprimé, La Société d'Eclairage électrique du Secteur de la place Clichy, La Compagnie d'Eclairage électrique du Secteur des Champs-Elysées, La Compagnie continentale Edison, and La Société d'Eclairage et de Force par l'électricité à Paris. Each of the Companies supplied an area known as a "secteur," and various systems of distribution were employed. Their original concessions were granted in 1889, and expired in 1907, when the Municipal Council of Paris drew up a new scheme extending the concessions till 1940, and decreeing that the present new Company should take them all over this year. The old Companies had to pay a royalty of £120,000 per annum, and the royalty to be paid by the new Company may be considerably increased above this figure if more than a 6 per cent. dividend is earned. In 1940 the whole of the stations and distributing systems will become the property of the Municipality without any payment. During the interval between 1907 and this year the supply has been jointly managed by the Comité de l'Union des Secteurs, and the shutting down and conversion into substations of the old generating stations has been proceeded with to prepare for the ultimate idea of supply from two or three large stations. The arrangement of the substations and zones of distribution was fully described in *ELECTRICAL ENGINEERING*, Vol. V., p. 719 (August 12th, 1909). At present the city is divided into four zones, supplied respectively on the three-wire continuous, five-wire continuous, single-phase and two-phase systems, and the bulk of the supply is taken from the huge St. Denis station, the "Triphasé" station at Asnières, and the station Issy-les-Moulineux. Some particulars of the first two of these were given in *ELECTRICAL ENGINEERING*, Vol. IX., p. 303, May 29th, 1913. An immediate effect of the change over is the announcement that the maximum price of current for lighting per hectowatt-hour is reduced from 7 centimes to 5 centimes.

## NEW LONG-BURNING FLAME-ARC

THE Electro Development Co., of New York, is putting on the market a long-burning enclosed flame-arc lamp, which, it is stated, will run for 200 hours on a single trim. According to the *Electrical World* of New York, the floating feed mechanism is controlled by a single series solenoid, which advances the lower electrode, a 9-in. by 1-in. treated carbon. The upper electrode is a 2-in. by 2½-in. piece of untreated carbon, and for D.C. operation is connected to the negative side of the line. A ratchet has been arranged to revolve this electrode as the side on which the arc is burning becomes lower than the surrounding parts. No economisers or blow magnets are used. The size of the upper electrode keeps the arc in nearly the same horizontal plane throughout its life, which is between 400 and 600 hours, so that the lamp is really of the focussing type, although without focussing apparatus. It is declared that the lamp will operate without flicker throughout each entire trim.

On D.C. circuits the lamp requires 5 amperes with 80 volts at the arc, while the A.C. lamp takes 7 amperes with 78 volts at the arc. Series lamps of this type are also manufactured. All of these lamps are equipped with a condensing chamber of solid copper having a gun-metal outside finish.

"Old Centralians' Magazine."—The current issue of this publication contains a valuable contribution from Dr. S. P. Smith, in which the theory and behaviour of the three-phase commutator motor is lucidly set forth. This type of motor lends itself admirably to speed control, but is of somewhat high cost. A contribution entitled "Ambitions: Commercial and Technical," from an anonymous author, compels attention on account of the way in which poignant facts are presented in a humorous manner. Mr. J. T. Irwin contributes a short article on his recent work on sound, using a very thin, tightly-stretched diaphragm of high natural frequency, so that direct records of the sound waves in air produced by the voice may be obtained. A *résumé* of the work of the City and Guilds (Engineering) College during last session is given, as well as copious Old Students' notes.

## THREATENED STRIKE OF ELECTRICAL WORKERS Union's "Ultimatum"

WE recorded in our issue of January 8th (p. 16) that the negotiations between the London Electrical Masters' Association and the Electrical Trades Union had been broken off, and that the Masters' Association had called a union and non-union meeting for Tuesday next (January 27th). The Electrical Trades Union has now issued its new Working Rules Card as an ultimatum. This has been sent around to all the London employers with the following covering letter:—

DEAR SIR,—Adverting to our letter of November 11th last, in which an application for an advance of wages to electrical grades was made, and in which we stated we were prepared to discuss this question with a body representative of the employers, we have received a communication from the Committee of the newly-formed London Electrical Masters' Association refusing to negotiate.

The Masters' Association was brought into being on December 3rd at a meeting of the employers as a result of the above application. A Committee was there appointed, with, we understand, definite instructions to meet representatives of the Trade Union. We have been and are prepared to meet a body representative of the employers to deal with any points at issue, providing the questions are discussed on their merits, without any previous conditions being exacted by either side. This decision we have communicated to the Committee of the London Electrical Masters' Association. Apparently at the bidding of a small caucus they have refused to accept these perfectly fair terms, without even consulting the opinions of the general body of employers.

A number of contractors and others have already conceded the rates we ask; a still larger number have written that they thought our claims justified. In the circumstances we have no alternative, representing as we do by far the larger section of the skilled workers in the industry, and having waited two months, but to issue the enclosed Working Rules Card, which will become operative on and after Saturday, January 24th, 1914.

Trusting we shall hear from you that the new terms have received your favourable consideration.

I remain, on behalf of the London District Committee,  
Yours faithfully,

J. POTTER,  
District Secretary.

We set out below in full the new Working Rules Card:—

### ELECTRICAL TRADES UNION.

#### LONDON DISTRICT WORKING RULES.

1. These Rules shall apply to all contractors, sub-contractors, and their workmen.

2. Fifty hours shall constitute a week's work (excepting shift men), but when members are working on jobs where the hours are less, the money shall be made up to equal 50 hours a week. Nine hours shall constitute a day's work for the first five days of the week, and five hours on Saturday.

3. Overtime worked on the first five days of the week to be paid for at the rate of time and a half for the first four hours, and double time after till starting-time next morning. If the work continues after 12 midnight, the member shall be paid up to starting-time next morning. Half an hour shall be allowed for tea, and one hour for supper if working after 12 midnight.

All overtime worked on Saturday and Sunday till starting-time on Monday morning to be paid for at the rate of double time.

Each day to stand by itself.

No member shall be allowed to work more than one night in succession, viz., that after working one night members must cease work at the usual time of leaving work next day.

No member shall be allowed to work overtime, unless absolutely necessary, when members in the district are unemployed.

4. Night-shift work to be paid for at the rate of time and a half, all time worked after nine hours to be paid for at the rate of double time.

#### Rates of Wages.

5. The minimum rates of pay shall be in accordance with the following scale:—

"Electrical Fitter and Wiremen" ...	11d. per hour.
Armature Winders ...	11d. per hour.
Cable Joiners ...	11d. per hour.
Plumber Joiners ...	1s. per hour.
"Joiners'" Mates ...	8½d. per hour.
Meter Fixers ...	£2 per week.
Coil or Magnet Winders ...	9½d. per hour.

All Charge Hands to receive a minimum of 1d. per hour extra.

Shift Engineers ...	£3 0 0 per week.
Switchboard Attendants ...	£2 5 0 per week.
Accumulator Erectors and Attendants ...	£2 5 0 per week.
Power and Dynamo Attendants ...	£2 5 0 per week.
Arc Lamp Trimmers ...	£1 18 0 per week.

The total number of hours worked shall not exceed 56 per week.

6. All members (except inside workers) working over one and less than twelve miles from shop, to be allowed travelling time and third class ordinary railway fares. Country expenses to be not less than 2s. 6d. per day in England, and not less than 3s. per day in Scotland or Ireland. Travelling time and third class railway fares to be paid for the journey from shop to job, and from job to shop.

Inside workers shall be allowed walking time for any distance under one mile, and not less than one shilling per day for over one mile and under three miles from shop. Not less than 1s. 6d. per day outdoor money be paid, and travelling time and third class ordinary railway fares allowed for any distance over three miles and under twelve miles from shop.

7. All members working on any dirty job must receive not less than one shilling per day extra. All members working on any dangerous jobs must receive 2s. 6d. per day in addition to outdoor money.

Members sent to work on jobs on the Continent of Europe must receive not less than 1s. 3d. per hour, in addition to £1 10s. expenses.

8. District holidays to be: Easter Monday, Whit Monday, August Bank Holiday, Christmas Day, and Boxing Day. No holiday shall entail more than two days' loss of time. The rate of pay for Bank Holidays shall not be less than time and a half, Christmas Day and Sundays not less than double time.

9. Payment of wages shall commence as soon as practicable after the time of leaving off, and be paid on the job or place of employment; but if otherwise arranged, walking time at the rate of three miles per hour shall be allowed to get to the pay table. Any workman kept waiting for his wages beyond twenty minutes to receive time and a half for all time kept waiting from the time of leaving off work. Not more than one day's wages shall be kept in hand as back time.

10. One hour's notice to be given on either side on determining an engagement. All wages due to be paid at the expiration of such notice, or walking time if sent to shop. Weekly employees to give and receive one week's notice. Members running casing to receive one hour's grinding money in addition to one hour's notice.

11. Employers shall provide where practicable and reasonable the following conveniences:—

(a) A suitable place for the workmen to have their meals on the works, with a labourer to assist in preparing them.

(b) A lock-up where tools can be left.

(c) A grindstone for the use of workmen.

(d) The provision of proper sanitary accommodation.

12. Sub-letting for labour only to be prohibited.

13. The term "London District" to mean a twelve-mile radius from Charing Cross.

14. All members working in shops where the conditions are better than this card demands must uphold the established conditions of the shop.

The District Secretary of the Union contends that the Committee of the London Electrical Masters' Association is not representative of the electrical industry in the metropolis, and that the notice issued by them is "a departure from all accepted principles of negotiating with a workmen's association on questions relating to wages and working conditions."

In looking through the new Working Rules Card we notice that no attempt has been made to provide for any of the lower grades of workmen except "joiners'" mates, which is presumably a misprint for "jointers'" mates. It is also noteworthy that the rules are said to apply to all contractors and sub-contractors, and yet the proposed new rates of wages include shift engineers, switchboard attendants, power and dynamo attendants, and arc lamp trimmers, few of whom can be employed by contractors, and practically none are members of the Union. We understand that the London Electrical Masters' Association will meet to-day to discuss what action they will take.

Not without interest is the position in the building trade, as it is the "sympathetic" action of many of the branches of this trade which has helped the Electrical Trades Union, and has resulted in the withdrawal of the London Master Builders' Association from their agreements with most of the building trade unions. Last Saturday all members of the London Master Builders' Association informed all their employees (except mill sawyers and wood-cutting machinists, smiths and fitters, plumbers, and crane-drivers) that they must sign a guarantee by next Saturday that they will not quit their employment because any fellow employee is or is not a member of a trades union. This, it is believed, a large majority of the men will be sufficiently ill-advised to refuse, and unfortunately there is every likelihood of a big lock-out in the building trade in a few days.

**San Francisco International Electrical Congress.**—Plans are already well under way for the provision of special trains from the East to San Francisco in connection with the International Electrical Congress to be held there in September 1915. A 30-day excursion, embracing Chicago, Colorado Springs, Salt Lake City, San Francisco, Santa Barbara, and Los Angeles, as well as other places of interest, is also being arranged. The secretary is Mr. Preston S. Millar, 80th Street, New York.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,375.

Give particulars of any rules or curves showing the power lost (in watts) in ring lubricated brass bearings, compared with the power lost in ball bearings suitable for the same load and speed. Compare also the probable life of the above two types of bearings. If possible tabulate the minimum number of balls per bearing and diameter of each ball and ball race, against maximum load per bearing and maximum safe speed of the inner ball race for both ball and thrust bearings. Is the true spherical, or elliptical, shape of ball race the most reliable? When is it advisable to depart from ball to roller bearings?—"F."

(Replies must be received not later than first post, Thursday, January 29th.)

### ANSWERS TO No. 1,373.

It is proposed to use the lead covering of three-phase, three-core power cables (which are laid solid in bitumen) for single-phase lighting at 260 volts. The three phases would be practically balanced, and the wiring for lights would be single lead covered. The machines are 450 volts, 50 cycles, with neutral and cables earthed at power station. The lead covering at the end of each cable is used for earthing. The longest length of cable is about 450 yards. What are the chief points to bear in mind on such a scheme? Would it be an advantage to earth each cable at the far end?—"PHASE."

The first award (10s.) is made to "A. G. R." for the following reply:—

In reply to "Phase's" query, I would point out, in the first instance, that in this country the Board of Trade Regulations call for the efficient earthing of the lead sheathing of all main cables at one point only, viz., at the generating station. Therefore "Phase" must not earth his cables at the far ends. Also, as this fourth wire of his system is to be used for lighting, and is earthed, the generator neutral points must be connected to it, and the system becomes a three-phase with earthed neutral; in one way this will be an advantage, as the three mains are now only at a potential of 260 volts above earth. As the wiring for the lighting circuits is to consist of single-core lead-covered cables, care must be taken to connect efficiently this lead covering to the lead covering of the main three-phase cables, and to make sure that it is electrically continuous throughout. These single-core cables must not be earthed, as the lead sheathing of the main cables is earthed at the station. The lead being practically balanced, the total current through the lead return will be comparatively small, but care must be taken to ensure that the current density does not reach an excessive amount, or cause the lead to heat up. If the cables are by any chance armoured, the armouring will be earthed at the station, and will also be in parallel with the lead sheathing, thus increasing the conductivity of the neutral return, which will be a great advantage. No switches, fuses, or protective gear are required in the earthed main.

No reply worthy of a second award has been received.

## THE RATEABLE VALUE RESIDENCE TARIFF

MR. A. H. SEABROOK'S Address as Chairman of the "Point Fives," on Friday last, dealt with tariffs. He commenced by saying that, although in his Paper on "Residence Tariffs," before the Institution of Electrical Engineers on December 14th, 1911 (ELECTRICAL ENGINEERING, Dec. 21st, 1911, p. 693, Vol. VII.), he had adversely criticised the rateable value system of charging, careful investigation had convinced him that the system is superior to all other bases of primary charge, with the proviso that where the price of gas is not more than 2s. 6d. per 1,000 cub. ft., the secondary rate should not exceed  $\frac{1}{4}$ d. per unit. Electricity at 6d. per unit, flat rate, could compete with gas at this price. Among the many advantages of this system, he mentioned that it was adaptable to an almost universal application, because any percentage of the rateable value could be taken without affecting the principle, while the actual energy could in nearly every case be supplied at  $\frac{1}{4}$ d. per unit. In this case improvements in the efficiency of lamps did not affect the revenue to nearly the same extent as in the case of the connected load basis, maximum demand or flat rate. It was possible to regard the rateable value system in two ways. First, to calculate the primary charge so that it covered investment costs and standing charges of the complete electric service to a residence, and that the secondary rate of  $\frac{1}{4}$ d. represented the running costs, plus profit, of the units sold. Secondly, the primary charge, plus a few units at  $\frac{1}{4}$ d., could be regarded as the charge for lighting the residence, and the secondary regarded as the charge for additional business for other uses than lighting. The objection that this was unfair he regarded as merely sentimental, and had no foundation beyond the fact that it enabled a consumer who would not use electricity for heating and cooking on account of "sheer cussedness, or some other consumerlike reason," to complain that he was paying more for his lighting than it cost the undertaking, plus reasonable profit. But if the supply authority were debarred from charging a high lighting rate, by being allowed to put standing charges to it, it could not offer a sufficiently low rate to get the heating and cooking load as "additional business." The railway companies, who had had more experience in rate-making than Electricity Supply Authorities, were confronted with a similar problem, and out of their experience they found that they could charge exceedingly low rates to temporary visitors for season tickets between seaside resorts and the big towns, who might otherwise not be encouraged to indulge in a holiday broken up by frequent journeys to town. The various objections to the "rateable value" system which have been advanced from time to time could all be met, the author showed, by remembering the recognised principle in rating that "those who can pay shall pay."

The following passage of the Address is important and worthy of serious consideration:—

"We really must make up our minds to observe the fundamental law of business, which is that the selling price of a commodity is what it will fetch in the open market; if we fix a price above this we will do only a small restricted business. If we fix upon the market price, our sales and profits will depend upon the efficiency of our organisations and selling staffs. If we are unable to make up our minds to charge  $\frac{1}{4}$ d. per unit when that figure is the competitive market price for electricity used for cooking and heating, it is far better to fix, say, 3d., and keep off the business until we are really prepared to regard it as a serious item of income."

### British Electrical and Allied Manufacturers' Association.—

At the Council Meeting of the Association held at King's House, Kingsway, on the 15th inst., the following firms were elected members of the Association: Bray, Markham & Reiss, Ltd.; W. T. Glover & Co., Ltd.; and Siemens Bros. & Co., Ltd.

**Overhead Power Lines.**—The first sentence of the second column of our report of Mr. Welbourn's Paper on this subject, on page 35 of our last issue, should read: "The author advised the use of aluminium in preference to copper when the cost of the former gives the cheaper line, especially where the air is laden with sulphurous products."

**Power Railway Signalling.**—At the Students' Meeting of the Institution of Civil Engineers, held on January 9th, Mr. C. I. Routh read a Paper entitled "The Application of Power Railway Signalling in Great Britain." The chair was taken by Mr. A. W. Szlumper, who said that power signalling was still at an experimental stage in Great Britain, and he strongly advised young engineers who are in any way interested in this branch of engineering to take it up thoroughly, as he considered it had a great future before it.

## PROSPECTS OF THE HALF-WATT LAMP

**B**ELOW are further letters received from Supply Station Engineers in various parts of the country, in reply to our inquiry as to the prospects of the half-watt lamp in their districts:—

**MAIDSTONE.**—MR. E. E. HOADLEY sees a good use for the 1,000-c.p. lamp to replace groups of ordinary tungsten lamps in street lanterns where the old co-axial arc lamps had previously been employed. He also sees a good market for this size of lamp and the 500-c.p. lamp for outside shop lighting.

**LOWESTOFT.**—MR. W. R. MAY writes: If we can be practically sure of getting about 900 hours of burning, it will be invaluable for street and outside shop lighting, as it will, especially in the 2,000 and 1,000 c.p. sizes, compare very favourably with flame arc lighting.

**ST. ANNE'S-ON-SEA.**—MR. J. H. CLOTHIER does not anticipate any large demand for half-watt lamps in his town, as the public lighting is practically all by electricity with 100-c.p. lamps.

**BEXLEY.**—MR. H. P. STOKES says that the lamps will provide a very powerful weapon in competing with high-pressure gas.

**DONCASTER.**—MR. E. S. RAYNER writes: It is the one thing needed to compete with the outside gas lighting of shops, and I think it will be a very great rival to the arc lamp, as all incidental expenses of trimming, &c., are absent.

**BRAY.**—MR. W. J. U. SOWTER writes: Some time since, we replaced all our open type arc lamps by tungsten 600-watt lamps, and the change has proved most beneficial. No doubt we shall try the half-watt lamp, and its success will depend to a large degree upon its initial cost and useful life. Current for street lighting can be generated so cheaply, however, that economy of consumption is not of very great importance, and it may be advantageous to continue the use of the less efficient lamp.

**CHESTERFIELD.**—MR. R. L. ACLAND says that the large units will be of great assistance for street lighting, and as the lamp gets down to the lower candle-powers, the electricity v. gas question will be finally solved.

**WREXHAM.**—MR. W. G. PICKVANCE replaced his arc lamps with high candle-power tungsten lamps two or three years ago, and for the last four years has supplied consumers' outdoor arc lighting at 3d. per unit, including carboning and maintenance. He anticipates using half-watt lamps for both these purposes, but thinks that tariffs for tradesmen's premises should be considered at an early date before the half-watt lamp appears in small candle-powers, and that some charge such as the telephone rate should replace the flat rate.

**ISLE-OF-THANET.**—MR. J. A. FORDE anticipates that the lamp will eventually be manufactured in smaller candle-powers, and regards its advent with mixed feelings.

**TAUNTON.**—MR. A. J. HOWARD writes: They will enable us to compete with high-pressure gas on more than equal terms, and also to effect great economies in street lighting which will more than off-set any decrease in current consumption by private consumers.

**TORQUAY.**—MR. C. W. SALT says that the large high-efficiency lamp will be much welcomed in his town, especially for street lighting and shop window lighting.

**FOLKESTONE.**—MR. T. HESKETH says that the metal filament lamp certainly retarded the rate of progression at Folkestone, but by no means stopped his Company's progress. Experience has since shown that the change from 4 watts to 1 watt has proved one of their best friends, and he can only think that the change from 1 watt to  $\frac{1}{2}$  watt will be equally beneficial.

**GRANTHAM.**—MR. J. E. EDMUNDSON hopes to see the lamp in smaller sizes soon. The metal filament lamp caused the revenue of his undertaking at first to drop, but has now enabled business to be obtained which they could not get before. He thinks that the contract system of charging must soon replace a flat rate by meter alone.

**KETTERING.**—MR. W. A. WALKER says that large candle-powers on 200 volts D.C. would restrict the use of the lamps to street lighting, and he considers the flame lamp superior to the metal filament lamp for this purpose. Practically all the boot factories in his town, however, use arc lamps for lighting their workshops, and these are not very satisfactory, and their replacement by half-watt lamps will have the additional advantage of reducing the unremunerative peak load.

**STRATFORD-ON-AVON.**—MR. J. G. THAIN writes: It is the counter-stroke to the high-pressure gas system.

**GLOUCESTER.**—MR. F. H. CORSON says there can be no question of the value of the half-watt lamp as an important aid to the supersession of older methods of lighting. His welcome to small sizes would be less enthusiastic, as his department is still largely dependent upon lighting sales.

**MERTHYR TYDFIL.**—MR. D. W. DIXON thinks he can do much good with the high c.p. lamps in the district, as a good reply to the recent keen competition of gas. As tradesmen will not go to the expense of lanterns and lamps, a suitable tariff depending upon the hours of burning per annum has been arranged, and has become very popular.

**BOLTON.**—MR. W. J. H. WOOD anticipates there will be a large market for the lamp in a manufacturing town such as Bolton, where it should be extensively used for workshop lighting to replace arc lamps, and save trimming, cleaning, &c. The same, he says, will apply to street lighting and shop-window lighting. Generally he thinks that reduced current consumption will be compensated for by the more general use of electricity among manufacturers.

**HEYWOOD.**—MR. R. B. LEACH thinks the new lamp will be a tremendous asset to the electrical industry, and so make gas competition for lighting purposes more a thing of the past, especially when the lamps are made in smaller c.p. sizes. He thinks tariffs should not be increased except in very special cases.

**NORTHAMPTON.**—MR. G. H. JACKSON thinks the half-watt lamp will be very serviceable for many purposes in that town, both to compete with high-pressure gas and probably to replace some arc lamps. He hopes for lower candle powers for high voltage, and lower prices.

**SOUTH SHIELDS.**—MR. H. S. ELLIS says that the 1'1 to 1'25 watt lamp has not enabled him to make any headway against high-pressure gas, and those who had these lamps have only kept them on his convincing them that the half-watt lamp would be on the market before long. He is handicapped in competition with high-pressure gas by not being able to sell or hire electrical fittings, and believes that, in some cases, five-year agreements have been made by the Gas Company. He points out, however, that the low first cost for installing the half-watt lamp will be of assistance.

**STAFFORD.**—MR. W. H. ROBINS states that the Gas Department hire 750 c.p. high-pressure gas lamps at £3 15s. per annum, including gas, repairs, and maintenance. The development of arc lamps has also been impeded by the necessity for running two enclosed, or four open or flame type arcs in series. When the new lamp is sold at a lower price he says its success should be assured, but on the present life the cost of the lamp alone works out at 0'75d. per hour's burning for a 200-260 volt lamp.

**ECCLES.**—MR. H. W. ANGUS writes:—If the makers' claims be substantiated, I think these lamps should quickly dispose of most of the arc lamps in this town, and enable us to successfully compete for all classes of outdoor lighting. He trusts smaller sizes of half-watt lamp for general indoor light will come very gradually in the market, as he does not view with equanimity a further reduction in the revenue from lighting consumers.

**WARRINGTON.**—MR. F. V. L. MATHIAS says that the price of the lamps and the fact that at ordinary pressures about 2,000 c.p. is the least that can be installed will tend to restrict their employment, but he thinks that they may be used for illuminating large areas, and possibly, in the 300-watt size, for lighting shop-fronts.

**HARROW.**—MR. J. A. B. HORSLEY says that the Nernst, Gem, Tantalum, and Tungsten lamp has each in turn had a push from him into the arms of the consumer, and half-watt lamps will be burning in Harrow just as soon as he can get them.

**CHICHESTER.**—MR. R. V. WEARE states that the new lamp will be of the greatest value for the effective illumination of large interiors and street lighting.

**NORWICH.**—MR. F. M. LONG thinks that the lamps will prove a benefit to electrical undertakings in competition with gas, but in the present large candle-powers does not see much scope for them except in replacing arc lamps. He thinks that when they can be produced in 100-watt sizes they will be of very great value in enabling the standard of public lighting to be vastly improved. With a tariff consisting of a fixed charge and 1d. per unit, he looks forward with unconcern to the introduction of these lamps in the smallest sizes.

**UXBRIDGE AND DISTRICT.**—MR. A. R. BELL, whose district covers 80 square miles, sometimes wonders whether, with a one-watt lamp, electricity supply for lighting is a commercial proposition even at 7d. or 8d. per unit. He is glad that the high candle-powers will at present keep the half-watt lamp away from private houses and the interior of shop windows. There would otherwise be a liability of the lamp being used in improperly-ventilated fittings in positions where this would be dangerous.

**KING'S LYNN.**—MR. C. W. JACKSON obtains a life of 2,500 hours with one-watt lamps, so that the cost of renewals works out for a 2,000-c.p. lamp to 0'54d. for the half-watt and 0'33d. for the one-watt. This takes away 0'21d. from the cost of the unit saved, and the danger of trouble from extinctions, which is important with posts of such high candle-power in a small town, is enhanced. For shop-window and factory lighting he thinks they will be useful to a certain extent.

**WORTHING.**—MR. G. PORTER writes: It will enable us to compete on at least equal terms with the high c.p. high- and low-pressure gas lamp, and to offer contract terms to local authorities based on figures that are not of necessity severely "cut." The half-watt lamp also offers a much simpler solution of the street lighting problem than does the series arc lighting system, with its miles of cable and numerous automatic devices. There is an extensive series flame arc lamp system here in Worthing.

Its supersession by half-watt lamps, each one treated as an independent service, will save the ratepayers certainly two-thirds of the present charges for maintenance and upkeep. A flexible group switching and subdivision of lighting units will not be difficult to contrive. The blessing will not be so unmixed when the domestic half-watt lamp is put on the market. It is now more than ever essential for undertakings to augment their reserve and suspense funds to meet the contingency when it arises, and to bring their generating plants fully up to date. Obsolete engines and boilers, no longer used, but still representing annual payments of principal and interest, will have to be written off, and live plant installed in their place.

**MEXBOROUGH AND SWINTON.**—MR. P. PRIESTLY has already fixed a good number of one-watt 600 c.p. lamps outside business premises, and, having in view the satisfaction they have given, he is confident that the half-watt lamp will prove a success.

**NEWCASTLE-UNDER-LYME.**—MR. A. J. C. DE RENZI anticipates considerable use of the lamp for outside lighting by consumers who have none at present, and also thinks that it will enable the Electricity Department to secure the lighting of the streets in the centre of the town, which are lighted by gas at present. This, however, he says, is only on the assumption that the lamps will burn the full 1,000 hours.

**TWICKENHAM AND TEDDINGTON.**—MR. M. FARRER is now quoting for lighting a factory with half-watt lamps, and hopes to "pull it off," although he is in competition with high-pressure gas at very low rates. A 500-watt lamp should suffice to put in the shade the average high-pressure gas lamp as used for shop lighting. He regrets that nothing smaller than 2,000 c.p. is available for 240 volts, and is rather alarmed at the cost of renewals. He devoutly hopes that difficulties of manufacture will for a long time prevent the marketing of the half-watt lamp for ordinary domestic use, and incidentally fears that the introduction of the new lamp will be the "final blow" to arc lighting except in very special circumstances.

**WINCHESTER.**—MR. R. AXTON says that the only favourable view he can take of the matter at present is that the introduction of the lamp in workable candle-powers should enable every undertaking to gain control of the street lighting.

**NORTHWICH.**—MR. W. BOYD does not anticipate that the lamp will have anything but a beneficial effect upon output. Although the tungsten lamp was pushed vigorously from the start in Northwich, the output for lighting never fell below previous years. The ratio of increase was lowered for a few years, but business has gone ahead more quickly since.

**OBAN.**—MR. D. McLENNAN says the lamp has not been put on the market a day too soon. He extends to it a very hearty welcome in sizes large or small. He trusts it will be freely used "to curtail further destruction by poisonous and dangerously inflammable illuminants."

**WINDSOR.**—MR. A. E. FARROW says that the contemptuous attitude of the gas papers towards the lamp is evidence that they are realising its possibilities as a competitor. When the lamp is available in candle powers suitable for private houses, the depressing effect on the lighting load will be neither serious nor permanent. The standard of lighting has risen at every increase in efficiency until those who were satisfied with eight c.p. will now have no less than 25. There is also the present tendency to "comfort" lighting, which necessitates a somewhat higher consumption than the "more crude direct method." He concludes: "Mr. F. W. Goodenough gave his views of the relative costs of gas and electricity in the *Daily Mail* of March 3rd, 1909, putting the ratio at three. In view of what electricity has accomplished on a three to one handicap (assuming that Mr. Goodenough's figures are correct) to what may we look forward when that handicap is cut down by half?"

**KINGSTON.**—MR. J. E. ENDCOME writes: It is a good thing for the electrical industry generally, but the central station engineer, four-fifths of whose load is lighting, can but hope it may be some years before half-watt lamps in low candle powers are placed on the market. Stations in purely residential districts are now only recovering from the effects of metal filament lamps, but I can quite understand that engineers in manufacturing districts, where the lighting load is only a fraction of their total load, and who possibly have a large street lighting load, will welcome the half-watt lamp for street lighting purposes specially. On the other hand, the extra cost of the lamps over the present metal filament lamps will to a certain extent neutralise any saving in current consumption, and the accidental breakage of a few lamps, which may easily occur where a stock is kept, will be a serious expense.

**QUEENSTOWN.**—MR. F. L. WATSON is of opinion that in small towns of say 20,000 inhabitants and less, they will prove a godsend for street lighting. In connection with the high candle powers, he does not anticipate a very large field for interiors and exteriors of shops in small towns. When the lamps are made in sufficiently small units for private lighting, cooking and heating must be pushed, and special contract rates introduced. It is "up to" the makers of cooking and heating apparatus, he says, to produce an article that will be cheap, efficient, and strong. This, in conjunction with the half-watt lamp and suitable contract rates, would commence a new era in electrical supply.

**FALKIRK.**—MR. H. RANSON writes: I believe the half-watt lamp will prove the last nail in the coffin of gas lighting. Any tendency to disapprove of the new lamp owing to its possible effect on the lighting revenue is a most short-sighted policy. Had the 1½ watt lamp not been introduced, the use of gas would have been enormously extended. Provided the life of the new lamp is satisfactory, it should become a standard for street lighting in small towns. It is true that for efficiency it cannot even yet compare with flame arcs from the c.p. per watt point of view, based on photometer tests, but constancy of illumination is more important than extreme efficiency. Besides, I have yet to be convinced that the man in the street can tell any difference between, say, a 2,000 and a 3,000 c.p. unit unless he sees them burning side by side.

**ROCHDALE.**—MR. C. C. ATCHISON says the c.p. will be too large for anything but street lighting or for interiors of very large premises, and in Rochdale they have no street lighting by electricity, and no very large experience of large premises. He is inclined to think that consumers would prefer to use a number of small c.p. lamps for interior purposes, fearing the cost of renewals. On the other hand, outside lighting for shops can be better tackled by the use of a few large c.p. lamps.

**SHIPLEY.**—MR. W. REDMAN says the advent of the half-watt lamp will considerably hasten the universal adoption of electricity as an illuminant.

**ALDEBURGH, BUDE AND STRATTON, FRINTON-ON-SEA, MILFORD-ON-SEA, and TADCASTER.**—MR. F. CHRISTY, of Christy Bros. & Co., Ltd., who are responsible for the electric lighting of these places, does not think that the half-watt lamp will have anything like so marked an effect on small undertakings as the metal filament lamp, until the manufacturers are able to make them in much smaller sizes. In larger undertakings, however, the saving of labour will enable street lighting, and the lighting of factories and shipyards, to be carried out at much cheaper prices than with arc lighting, and will compare very favourably with the cost of high-pressure gas. Continuous current stations, he thinks, will, of course, feel the effect much less than the A.C. stations, as with the latter the low voltage transformers will again come into more frequent use. He is confident that in the long run any cheapening in production will benefit the industry, and adds that "if someone will invent a 'one-tenth' watt lamp in small sizes, we should have to go to Parliament for a special Act to enable us to charge by a rateable value on the lines of a water supply, or by some similar method."

**Faraday House Engineering College Scholarships.**—An examination will be held at Faraday House Engineering College, beginning on Wednesday, April 1st, 1914, for one "Faraday" Scholarship of the value of 50 guineas per annum, tenable for three years, and for one "Maxwell" Scholarship of the value of 50 guineas per annum, tenable for two years. Full particulars can be obtained from the Secretary, Faraday House, Southampton Row, W.C.

**London University Education.**—The University of London Graduates Association, of which Mr. A. S. E. Ackermann, of 25 Victoria Street, S.W., is Honorary General Secretary, has just published as a small pamphlet its objections to the scheme proposed by the Royal Commission on University Education in London. The reasons given are plain, straightforward, and cogent. They are largely directed against that part of the report which aims at abolishing the external work of the University. There are large numbers of engineers who would be sorry to see this carried out.

**Compulsory Working of Patents.**—Section 27 of the Patents and Designs Act, 1907, provides that after four years from the grant of a patent "any person may apply to the Comptroller for the revocation of the patent on the ground that the patented article or process is manufactured or carried on exclusively or mainly outside the United Kingdom." This Section was generally welcomed in industrial circles in this country, and one of its effects was the erection of several new works in this country. There have been comparatively few cases of patents being revoked under this Section, partly because adequate manufacture in this country by the owners of patents themselves, or the granting of licences, has rendered applications for revocation unnecessary, and partly because of the technical legal difficulty of adducing evidence to prove that the manufacture has been inadequate. In view of some decisions under the Act, there has been some agitation for its amendment, and the Manchester Chamber of Commerce is endeavouring to get the clause amended so as to place the burden of proof of adequate manufacture upon the patentee. This course is strongly opposed by the Chartered Institute of Patent Agents, who suggest that if this alteration were made, applications under the clause would be made by rival firms solely for the purpose of obtaining useful business information from the owners of the patents. They propose that the applicant for revocation should have to prove that he had been refused a licence under the patent on reasonable terms, and should undertake to manufacture the patented article himself if the patent were revoked.

## OVERHEAD LINE CONSTRUCTION FOR MEDIUM AND LOW PRESSURES

MR. A. P. TROTTER read an important Paper on overhead line construction for medium and low pressures before the Institution of Post Office Electrical Engineers on Tuesday last. The Paper states the present position very concisely and explains the Board of Trade rules and the modifications in the standard practice which have been allowed. On account of the importance of the subject, we are publishing the Paper almost in full, with the explanatory drawings and diagrams.

The routes of the lines considered are generally along streets or suburban roads. The first case which was officially authorised was at Keighley, in 1904. Two-wire distribution is generally confined to small towns or villages, and in a few cases power is supplied from tramway trolley wires. The suggestion has been made that the wires should be crossed at each span, the earthed negative being below the positive, to give some chance of a shut-down in case of breakage of the positive wire. In view of the very few cases of injury resulting from the breakage of trolley wires at 500 volts, the risk of accident due to the breakage of a wire at a

such a manner that in the event of breakage of an unearthed conductor it must fall on the earthed conductor or on wires connected thereto.

Hitherto no regulation had been made which was specially applicable to three-phase four-wire work. The earliest example of D.C. three-wire supply on this method was carried out by Mr. Reginald Wilson at Dudley at the end of 1906. Fig. 1 shows the arrangement. The structure required for carrying guard wires is seen at A, B, C. In the following year the same method was used by Mr. C. J. Wood, at Sale, Cheshire, Fig. 2. A single cross arm is used and the insulators for the neutral wires are of a very simple pattern appropriate for the small voltage from earth. About the year 1910 it was suggested by Mr. Harold Gray, of Accrington, that the neutral wires should be placed at a level higher than the positive and negative wires, and that they might be used as guard wires. This has the advantage that the cross wires form a deep pocket which is much more likely to catch a live wire than the arrangements shown in Figs. 1 and 2. The Board of Trade regulations relating to the supply by overhead lines was amended in 1911 to read thus:—

Where a supply is given by overhead wires on the three-wire system, the positive and negative conductors shall be placed

FIG. 1.—MR. REGINALD WILSON'S DESIGN AT DUDLEY, 1906. THE PARTS A B C MAY BE REMOVED.

FIG. 2.—MR. C. J. WOOD'S DESIGN AT SALE, 1907.

FIG. 3.—MR. HAROLD GRAY'S DESIGN AT ACCRINGTON FOR STREET LIGHTING.

FIG. 4.—MR. C. L. E. STEWART'S DESIGN AT RAWTENSTALL, 1913, FOR TRAMWAY POLES.

FIG. 5.—MR. C. L. E. STEWART'S DESIGN AT RAWTENSTALL, 1913, FOR SPAN WIRES.

FIG. 6.—MR. H. B. HARVEY'S "TWO-WIRE" DESIGN.

FIG. 7.—MR. H. B. HARVEY'S "THREE-WIRE" DESIGN.

pressure not exceeding 250 volts above earth is not serious, and may be entirely prevented by splitting the neutral into two wires and connecting these in each span by cross wires. This method was described in the early Board of Trade regulations. The regulations in force for medium and low pressures apply to D.C. supply at a pressure not exceeding 650 volts from earth, which is intended to include the maximum drop on an overhead tramway feeder, and for A.C. supply at a pressure not exceeding 250 volts from earth. The risk of a fatal shock at 250 volts A.C., unless a large surface of metal is touched, is not serious, but four fatal and one nearly fatal accident have resulted from this cause. In three of the fatal cases the middle point of the system was earthed. It is therefore necessary that precautions shall be taken to render a broken conductor harmless. Minimum-current circuit-breakers cannot be relied upon, balanced protective devices would be too expensive, and the only method seems to be the one suggested in a regulation which appears as No. 6 of the latest code of medium and low pressure overhead wire regulations of the Board of Trade. This regulation, which covers three-phase four-wire work, reads:—

Where one conductor of an overhead line is connected with earth, the other conductor or conductors shall be arranged in

side by side. The intermediate conductor shall consist of two wires placed side by side at a distance apart greater than that between the positive and negative conductors, and connected in each span by two cross wires placed in such a manner that in the event of either the positive or negative conductor breaking it shall fall on one at least of the cross wires.

The regulations have never called for more than two cross wires. These should be placed as far from the poles as can be conveniently reached from a ladder placed against the pole, say 5 ft. If placed too near to the pole, a wire might lie on the ground without touching the cross wire. If placed too far, the wires swaying in the wind are liable to touch the cross wires. For tramway spans of 120 ft. it is found that 6 or 8 in. is a suitable distance horizontally between two live wires, but Mr. Gray finds that in the case of a live wire and a switch wire, as shown in Fig. 3, a distance of 3½ in. may be used. The method of controlling the street lighting at Accrington from a central point is of interest. The lines diverge from a central point, and these are switched on for the first half mile. The last lamp operates a switch which puts on the next half mile, which is supplied from an underground distributor. The last lamp of this half mile switches on the next half mile, and so on. At Rawtenstall, Mr.

C. L. E. Stewart has applied this system to street-lighting circuits by direct current at 230 volts to earth on tramway routes. In his first design the outer neutral insulators were mounted on long spindles, and the cranking of the arm to avoid this (Fig. 4) was suggested by Mr. A. J. Stubbs, of the Post Office. But at Rawtenstall the tramway poles are sometimes set back in cross streets to avoid obstruction of the pavements of the tramway thoroughfare. Here it is necessary to carry the lighting wires on the span wires. Fig. 5 shows the arrangement he has devised. The span wire is cut, and a double bar,  $1\frac{1}{2}$  in. by  $\frac{1}{2}$  in. is inserted, carrying the neutral insulators. In Fig. 6 is shown a design made by Mr. H. B. Harvey for a two-wire circuit. This, however, has not yet been carried out. One of the upper wires is an earthed neutral, and the other is an earth wire for earthing the brackets and tramway poles. The shackle insulator is of stock pattern, and is mounted on a bolt. In Fig. 7 is a design in which the two upper wires are neutrals, and the lower ones live wires.

(To be concluded.)

## ELECTRIC TRACTION NOTES

At Tuesday's meeting of the L.C.C. the report of the House of Commons Committee on London Traffic was discussed in connection with a long statement by the General Purposes Committee. This Committee recommended that the Council should concur with the views of the Select Committee that in all Metropolitan traffic matters Parliament should be advised by one department, which should combine the traffic duties of the Home Office, Local Government Board and Board of Trade. Further, that the Council should agree to accept a new Traffic Branch of the Board of Trade as a suitable authority for dealing with traffic matters in Greater London, provided that it consists of a small number of specially qualified persons selected solely on the grounds of their competence, such persons to hold office for a considerable period. The recommendation was eventually passed, practically unanimously.

Following the recent decision of the Board of Trade cancelling the licence to use the Dolter surface-contact system on the sea-front at Hastings, experiments have been made with a petrol motor-driven tramcar.

A Sub-committee of the Nelson Town Council has been inspecting a number of trolley-omnibus installations with a view to adopting this form of traction in Nelson.

In the jubilee number of *The Railway News*, just produced, is an article on the use of electricity for train lighting. This is devoted to a description of the Tudor Accumulator Co.'s (T. A. C.) system, and to a description of Messrs. Pritchett & Gold's accumulators, as being representative of current practice. In the T. A. C. system a compound-wound, belt-driven dynamo is suspended under a coach, preferably on the bogie frame, and is provided with an automatic switch to control the charge or discharge of the accompanying storage battery as the speed of the train varies. There are two coils to the switch; one is connected across the dynamo brushes and the other is in series with the dynamo. As soon as the dynamo pressure is sufficient, the shunt coil closes the switch and connects the dynamo to the battery. The series coil assists the shunt coil as long as the dynamo is generating, but as soon as the pressure across the battery terminals exceeds that generated by the dynamo sufficient to pass two or three amperes through the series coil, the switch is opened and the lighting done by the battery—across which the lamps are permanently connected—in series with iron wire resistances, so long as they are alight. The battery itself is usually of fifteen lead cells with Planté type positives. To control the output of the dynamo a switch actuated by a coil connected across the dynamo terminals is set to open the dynamo circuit as soon as the battery is fully charged, and not to close again until the dynamo is nearly at rest. When this switch is closed its armature short-circuits three or four contacts, depending on the number of circuits to be controlled, and when open, as well as disconnecting these, it increases the resistance in the dynamo field circuit, so as to reduce the output to suit the load. These switches are usually mounted in a box in the coach. Another interesting article deals with the development and perfection of railway signalling, including block working, and the necessary instruments. Power and automatic signalling is also covered. There are also articles on the position of main line and suburban railway electrification in the United Kingdom and abroad, and descriptions of

the London Underground railways, but the bulk of the voluminous issue is devoted to the engineering and administrative sides of railway engineering all over the world. There are a number of illustrations of present-day practice, as well as many of historical interest.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

It is now practically certain that wireless installations will be made compulsory on ships carrying fifty persons. This is the result of the deliberations of the International Conference on the Safety of Life at Sea, which has now completed its work, and has drawn up a "Convention," signed by representatives of Germany, the United States, Australia, Austria-Hungary, Belgium, Canada, Denmark, Spain, France, Great Britain, Italy, Japan, Norway, the Netherlands, Russia, Sweden, and New Zealand. The convention has to be ratified by December 31st by the various States, and will then come into force on July 1st, 1915. Under the International Radio-Telegraphic Convention, ships were classified in three categories:—(1) Fast passenger steamers; (2) Steamships intended to carry twenty-five passengers or more; (3) Other vessels. It is now proposed that all merchant vessels, whether steamers or sailing vessels, engaged on international voyages, and whether carrying passengers or not, must be equipped with wireless telegraph apparatus if they have on board fifty persons or more, whether crew or passengers, but there is discretionary power to exempt vessels not travelling more than 150 miles from shore. It is laid down that continuous watch for wireless telegraph purposes should be kept by all vessels required to be fitted with wireless apparatus, by vessels as follows:—(1) Vessels of more than 13 knots which carry 200 or more persons, and which make voyages of more than 500 miles between two consecutive ports; (2) Vessels in the second category mentioned above, during the time they are more than 500 miles from land; (3) Other vessels required to be fitted with wireless apparatus which are engaged in Transatlantic trade, or whose voyage takes them more than 1,000 miles from land. Vessels in the second category which do not come within the above definition must keep watch for at least seven hours a day, besides the watch of ten minutes in each other hour required by the Radio-Telegraphic Convention. Fishing and whaling vessels are not required to keep a continuous watch. The watch is to be kept by qualified operators, and provision is made for the possible future introduction of an automatic apparatus to take the place of watchers. The wireless installation must have a range of at least 100 miles, and an emergency apparatus placed in the conditions of the greatest safety possible must be provided unless the main installation is placed in the highest part of the ship and in the conditions of the greatest safety possible. A transitional period is provided to enable wireless apparatus to be fitted, and operators and watchers to be obtained.

We have announced from time to time the decision of the Post Office to instal automatic telephone exchanges in different towns. We learn from *The Post Office Electrical Engineers' Journal* that, in addition to exchanges already working at Epsom and Hereford, the following are in course of erection:—Newport (Mon.), 1,800 lines; Portsmouth, 5,000 lines; Accrington, 700 lines; Paisley, 1,100 lines; Chepstow, 65 lines; Leeds, 6,800 lines. The equipment of these is being supplied by the Automatic Telephone Manufacturing Co., while the Western Electric Co. is equipping exchanges at Darlington, 800 lines, and Dudley, 500 lines. Siemens Bros. & Co. have in hand an order for an automatic exchange at Grimsby, 1,300 lines, and Stockport, 950 lines. The official switch is also to be extended by 150 lines.

Telegrams for Syria are no longer subject to delay.—Telegrams for all offices of the Republic of San Salvador excepting La Libertad are only accepted at senders' risk.—The Indo-European lines are down between Odessa and Kertch.—Deferred telegrams can be sent to Cyprus via Alexandria-Eastern.

**L.C.C. Scholarships.**—The London County Council is prepared to award 15 scholarships for full-time day instruction, and 180 exhibitions for evening instruction, in science and technology during 1914. Application for information and forms should be made to R. Blair, Education Officer, L.C.C. Education Offices, Victoria Embankment, W.C. The forms must be returned not later than February 14th.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published January 15th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

21,745/12. **Wireless "Calling-up."** W. H. SHEPARD and A. E. McKECHNIE. A signal representing the name of the receiving station is automatically transmitted as soon as the receiving apparatus is rendered operative by the transmitting apparatus at the calling station. The alarm, which comes into operation at the time that the receiving apparatus does, is an automatic transmitter, which then keeps sending the pre-arranged signal until the alarm is put out of action by the removal of the telephone receiver. The alarm is described in patent specification No. 11,479/12. Eight figures.

26,800/12. **Ductile Tungsten for Drawing Filaments.** C. TRENZEN. To make tungsten or other non-ductile or slightly ductile metals ductile by mechanical working, hydraulic pressure is applied to the amorphous metal, which must contain no crystalline particles or oxide, when for the first time heated to a temperature at which it tends to become crystalline. Thus, increase of density is brought about at the moment when, as the result of heating, the change from the amorphous to the crystalline would tend to occur.

29,384/12. **Mercury Vapour Telephone Relay.** H. DE FOREST ARNOLD (Western Elec. Co.). This invention comprises an arrangement of apparatus, part of which consists of an ionised stream, such as a mercury vapour arc, which is deflected under the influence of a magnetic field. There is a circuit in which the current variations in the incoming circuit are reproduced in circuits independent of the ionised stream. A non-arc gap in the outgoing circuit is arranged transversely across the ionised stream and to the magnetic field, produced by an electromagnet placed as near as possible to the longitudinal centre of the ionised stream. The outgoing circuit is comprised of a balanced differential circuit connected to electrodes of special design and arrangement. Two figures.

29,461/12. **Liquid Controller.** R. F. BAERLOCHER and ALLEN WEST & Co. The liquid is maintained at a constant level while the electrodes themselves are moved. They are balanced by a weight moving in a separate container, to which water is added at any desired rate. This reduces the effective weight of the balance weight, and so allows the electrodes to fall by gravity to the full-on position. It is smaller than most liquid controllers, and requires no pump if a water supply is available, otherwise a small pump is necessary. Two figures.

9/13. **Cleaning Metallic Surfaces.** C. H. THOMPSON. The articles to be cleaned are immersed in an electrolyte through which an alternating current is passed between separate electrodes which are protected by perforated or porous partitions. The electrolyte must set free hydrogen kations and anions of HCl or HNO<sub>3</sub> or H<sub>2</sub>SO<sub>4</sub> or HP or HBr or HCN or CrO<sub>3</sub>.

2,749/13. **Semaphore Railway Signals.** R. M. DE VIGNIER (Western Elec. Co.). The semaphores are electromagnetically moved to danger under the control of a distant operator and manually moved to the safety position. A clock-train interrupting mechanism is mechanically associated with each semaphore so that it is released only after a predetermined movement of the semaphore and signals to the operator that the movement has been effected. Five figures.

9,530/13 and 10,018/13. **Lamp Substitutional Resistances.** W. HEINS. A small disc of carborundum with convex sides is placed in parallel with the lamp or lamps, and is found in case of failure of the lamps to assume the same resistance as the lamp, whereas as soon as the lamp circuit is completed through a new lamp the carborundum reverts to its normal high resistance. A substitute lamp may be brought into circuit by the heating of the carborundum acting on a contact in its circuit. There are three and two figures to these specifications.

9,685/13. **Amortisseur Windings.** B.T.-H. Co. and F. P. WHITAKER. To prevent locking of armature and field, the amortisseur bars in one pole pitch occupy a different relative position to the centre line of the armature slot from those in the other pole pitches. One figure.

## Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.** B.I. & H. Co. and BLADES [Cable connecting boxes] 29,774/12; INGHAM [Bituminous compositions] 1,458/13; MANSON [Fibre board] 2,287/13; B.T.-H. Co. (*G.E. Co., U.S.A.*) [H.P. insulators] 8,675/13; "VULKAN" MASCHINENFABRIKS A.G. [Motor control for reciprocating machines] 12,131/13.

**Dynamos, Motors and Transformers:** MELLERSH-JACKSON (*Caldwell*) [Vacuum valve tube rectifiers] 29,839/12; ROSENBERG [Synchronous machines] 6,891/13; MASON [Ignition dynamos] 8,964/13; LUDWIG [Commutator truing] 20,912/13.

**Electrometallurgy and Electrochemistry:** TISCHENKO and PLAUSON [Iron and steel manufacture] 27,147/12; GRÜCHTEL [Welding] 331/13; JOHNSON (*Badische Anilin & Soda Fabrik*) [Gas reactions in arc furnaces] 974/13.

**Ignition:** MORDEY, 24,563/12; RUNBAKEN [Spark plugs] 333/13; DIRAND [Spark plugs] 11,737/13.

**Incandescent Lamps:** GARDE [Candle lamps] 24,971/12; KAST [Preparation of metals and metal oxides in a minutely divided state] 5,212/13; ZSCHOCKE, 7,059/13.

**Meters:** B.T.-H. Co. and YOUNG [Mercury motor] 1,855/13.

**Switchgear, Fuses and Fittings:** MARTYN [Incandescent lamp holders] 80/13; TURNER [Switch casings] 212/13; HARRISON and FRASER [Lamp reflectors] 8,881/13; MOORE [Annunciator and circuit changer] 10,157/13; ZUMPE [Casings for pocket battery lamps] 14,091/13.

**Telephony and Telegraphy:** SHEPARD and McKECHNIE [Alarms for wireless] 22,036/12; PARRY [Recording telephone messages] 29,874/12; HEURTLEY [Telegraphy] 316/13; CREED, BILLE & Co. (*Bille*) [Automatic telegraph transmitters] 3,883/13; BECKMANN and A.G. MIX & GENEST [Selector for party-line telephones] 11,579/13; SIEMENS & HALSKE [Prepayment mechanism for telephones] 16,376/13.

**Traction:** DRAKE and BURNETT [Trolley collectors] 7,213/13; GALLUSSER [Electric controlling valve for air-brakes] 8,865/13; CROSS [Electric road vehicles] 18,819/13.

**Miscellaneous:** ELEC. HAMMERS and SCOTT [Portable hammers for caulking, &c.] 24,941/12; HELM [Coils and their manufacture] 91/13 and 4,091/13; SCHNYDER [Electromagnetic type-writers] 2,170/13; HASLER A.-G. VORM TELEGRAPHENWERKSTATTEN VON G. HASLER [Speed indicator] 12,474/13; SIEMENS BROS. (*Siemens & Halske*) [Optical pyrometers] 17,927/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Arc Lamps:** KORTING & MATHIESEN A.-G., 27,878/13; STAVE [Globes] 29,425/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.** MEHLUM [Machines for making fibre tubes] 28,423/13; MACNAB [Distributing and control systems] 29,216/13.

**Dynamos:** BETHENOD [Maintenance of constant pressure] 27,852/13; DE LA RIBOISIÈRE [Magnet] 29,562/13.

**Ignition:** VOIGT & HAEFFNER A.-G. [Polyphase current starters] 19,648/13.

**Switchgear, Fuses and Fittings:** A.-G. BROWN, BOVERI [Reversing and braking A.C. motors] 28,933/13.

**Telephony and Telegraphy:** DR. ERICH F. HUTH GES. [Wien's shock excitation system for wireless] 28,369/13; BETULANDER [Automatic and semi-automatic telephone exchanges] 29,615/13.

**Miscellaneous:** RIBOISIÈRE [Operating automobile door sashes, &c.] 26,060/13; PILLERSDORF [Alarm clock] 27,541/13; SCHERBIUS [Introduction of wires or conduits into evacuated vessels or casings] 29,609/13.

The following Amended Specification may now be obtained:—  
**Miscellaneous:** W. J. BEVILLE [Sign] 19,736/11.

## Grant of Patent Allowed

9,112/11. **Constant Pressure Variable Speed Dynamo.** A. H. MIDGLEY and C. A. VANDERVEIL. The Comptroller's decision to grant this patent in spite of opposition has been upheld by the Law Officer on appeal.

## Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

1,617 of January 25th, 1900. **Carbon Switch Contact.** A. REICHWALD (*Friedr. Krupp A.-G., Germany*). The carbon block is in the form of a truncated cone with flat base, and is held to its carriage by a screwed collar bored conically to grip the sides of the carbon.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Dynamos and Motors:** R. LUNDELL [Starting single-phase induction motors by extra currents fed into rotor] 19,899/05.

**Incandescent Lamps:** B. T.-H. Co. (*G.E. Co., U.S.A.*) [Squirted metallic filaments] 21,504/06; [Connecting metallic filaments to leading-in wires] 21,506/06.

**Traction:** J. G.-V. LANG and JOHNSON-LUNDELL ELEC. TRACTION Co. [Regenerative control using series motors] 20,721/08.

**Miscellaneous:** J. W. MILLIGAN and H. RALLINGS [Grinding and polishing pen-nibs] 19,363/01.

— Notes on Tenders Invited and Prospective Business appear on p. 54. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**SMALL MOTORS.**—A new abridged list of A.C. and D.C. motors of powers from 1/50 h.p. to 25 h.p. has just been issued by The Sun Electrical Co., Ltd. (118-120 Charing Cross Road, W.C.). Included is a range of motor-driven drills, grinders, and polishing machines, as well as a range of small motors with clamps for the individual driving of sewing machines. Particulars of suitable starters for all the motors are also given.

**UNIVERSAL CONDUIT BOX.**—Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), have published a supplementary sheet which gives particulars of their Universal conduit boxes. These are listed at considerably lower prices, due to improved methods of manufacture and increased output. The box is primarily intended for screwed conduit installations, and can be used as a bend or T-box for mounting such accessories as ceiling roses, switches, wall plugs, and so forth. Full particulars and prices are given for the box used with all these combinations, in addition to prices for the box alone, not drilled or tapped for conduit.

**TIME SWITCHES.**—A leaflet from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), describes a neat time switch. The clock has a lever movement, and is easily accessible, and the apparatus automatically adjusts the time of lighting and extinguishing the lamps according to the season of the year.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**"STRIPLITE."**—Another leaflet from the General Electric Co., Ltd., deals with the construction and prices of the "Striplite" system of concealed lighting. The lamps and fittings are available in different sizes, and with aluminium or china reflectors for shop windows, show cases, &c.

**GLOWING RADIATORS, &c.**—The Electrical Supplies Co. (41 Cheapside, E.C.) has in preparation a comprehensive list of luminous lamp radiators, convectors, radiant electric fires, cooking utensils, &c., in a large number of designs. While this is being compiled, however, an advance list is being circulated. Representative designs of many types of radiator for office or drawing-room use are listed in it.

**LIGHTING AND PUMPING SETS.**—A leaflet from De Russett Bros. (4 Page Street, Westminster), relates to petrol-electric and paraffin-electric, direct-coupled electric lighting sets, and also pumping sets.

**ALUMINIUM CHEMICAL PLANT.**—A pamphlet from the British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), deals with the use of aluminium in the varnish industry, as well as for sugar refining, brewing, dyeing, &c.

**BLUE PRINTING.**—The Westinghouse Cooper Hewitt Co., Ltd. (80 York Road, King's Cross, N.), has issued a new list dealing with the use of mercury vapour lamps for blue printing. The lamps are now supplied for taking continuous prints of all kinds, either 0.32 in., 45 in., or 60 in. wide. In a recent test satisfactory results were obtained at the rate of 23 ft. per min.

**PRESSURE GAUGES.**—Three new catalogues, superseding previous issues, have been sent out by Schäffer & Budenberg, Ltd. (Whitworth Street, London Road, Manchester). The catalogues respectively deal with self-recording pressure gauges; gun-metal taps, iron syphons, &c.; and reciprocating and rotary counters.

A pretty calendar has been sent us by Mawdsley's, Ltd. (Dursley, Gloucestershire), who are the manufacturers of the well-known "Zone" dynamos and motors. The calendar, which is in a restful brown, bears a reproduction of the picture by W. H. Margetson, entitled, "When Autumn Breezes Blow."

A bold wall calendar in green and white is that sent by the Liverpool Electric Cable Co., Ltd.

We are pleased also to receive a wall calendar from W. A. Walberg & Co. (38 Victoria Street, Westminster, S.W.), who are suppliers of machine tools and workshop equipments.

A calendar of rather striking design, in which the essential part is clearer than is often the case, is being sent by the Union Electric Co., Ltd., to its friends.

### FITTING FOR "HALF-WATT" LAMPS

London agents for the Wardle Engineering Co. are Messrs. Nathan & Allen (Queen Anne's Chambers, Westminster, S.W.).

THE fitting here illustrated has been designed primarily for street lighting or similar purposes with "half-watt" lamps. The height of the lamp in the fitting is adjustable, so that it can be focused. The fitting is well ventilated, and mechanically is designed upon the usual well-known principles of the Wardle Engineering Co., Ltd. (196 Deansgate, Manchester), who are manufacturing it and will have it on the market within the next fortnight. The fitting may be supplied with automatic cut-out and substitutional resistance for series working if necessary. The overall height is 3 ft., and the reflectors are designed to reach the maximum candle power at an angle of 20° from the horizontal. The filament itself is above the level of the bottom of the top reflector, and the horizontal rays are reflected from the interior of the reflector back again at the desired angle, the upper and the lower rays being reflected at a similar angle from the opal conical reflector underneath the lamp. The

### A STAGE LIGHTING PLUG

work call for a large number of points situated about the stage from which a supply of electricity can be drawn at a second's notice. Particularly is this so in the case of music halls, where the interval between "turns" is merely a few seconds. A plug and socket which has been designed by a stage engineer to meet the stringent conditions of such work has recently been introduced by the General Electric Co., Ltd., of 67 Queen Victoria Street, London, E.C. This is known as the "Morehen" plug, and is an adaptation of the G.E.C. dock plugs. The socket is fixed under the stage level, and affords every facility for taking temporary leads to portable stage properties. The plug portion is of hard wood, and is practically unbreakable and has no projecting pins, while the counter-sunk contacts preclude all danger of shock. When the plug is removed the protecting lid automatically closes up the plug entrance, so that there is little liability for water or dust to enter the interior. Nevertheless, under extreme circumstances it is impossible to keep water out, and in order that any water entering may immediately be discharged, the socket is designed with tapering sides and with an inclined bottom, in which are two holes. The illustrations show the plug and the interior of the socket. It is impossible to reverse the polarity, and the plug can therefore be used on arc lamp circuits. It can also be supplied for incandescent lamps. Plugs for these types of circuit are not interchangeable. We believe that these plugs have been supplied to a number of theatres and music halls, in which they have met with every success.

## ILLUMINATED HOARDINGS

To get the best results from posters, they should be artificially lighted at night, so that their message is always before the public, instead of being automatically interrupted at a time when people have the most leisure in which to study them. The British Thomson-Houston Co., Ltd. (77 Upper Thames Street, E.C.), has shown what can be done in this direction by means of modern electric lamps and properly designed reflectors. An effective example is

HOARDING ILLUMINATED BY MAZDA LAMPS AND MAZDALUX REFLECTORS.

afforded by the poster shown in the illustration. This is from an untouched night photograph. This poster measures 11 ft. by 8 ft., and was put up some weeks ago to advertise a series of performances of *The Mikado*, given at a Rugby theatre by the B.T.-H. Social Club. The installation consists of a row of Mazdalux weatherproof metallic angle reflectors and Mazda drawn-wire lamps, fixed above and in front of the hoarding in such a position that the light is thrown evenly over the whole area.

## OSRAM DRAWN WIRE BATTERY LAMPS

WE have just received from the General Electric Co., Ltd. (87 Queen Victoria Street, E.C.), their new list of Osram drawn-wire battery-type lamps. This list covers all types of lamps from the tiny bulb of less than  $\frac{1}{4}$  in. in diameter for medical and scientific work, up to the powerful 50-c.p. for use in automobile headlights. Many important alterations and improvements have been effected, whilst a number of entirely new types have been added. We note that wherever possible the size of bulbs has been reduced and new improved

FIG. 1.—MOTOR-CAR HEAD-LIGHT LAMP.

FIG. 2.—MOTOR-BUS LAMP.

FIG. 3.—TUBULAR MEDICAL LAMP.

filaments have in a number of cases superseded the earlier ones. A new type of Osram headlight lamp, in which special care has been paid to the correct form of filament for use in parabolic reflectors (see Fig. 1) has been introduced. The construction of the helical filament is clearly seen from Figs. 4 and 5. In this connection reference may be made to

another G.E.C. publication entitled "Motor-Car Lighting by Osram Drawn-Wire Lamps." This is a tastefully got-up booklet dealing fully with the theory and practical application of efficient motor-car lighting. The disposition of the lamp filaments and the behaviour of reflectors is fully dealt with. For side lamps a bow filament is used, and for dashboard and tail lamps horizontal spiral filaments. Equal care has been given to automobile lamps for interior lighting. For miners' and other portable lamps a bulb giving a minimum of 1 c.p., in accordance with the Home Office Regulations, has been designed. Types of lamp for sign illumination are listed, which, owing to their low current consumption, enable the

FIG. 4.—ENLARGED VIEW OF DRAWN WIRE FILAMENT USED IN HEAD LAMP.

FIG. 5.—ENLARGED VIEW OF ARRANGEMENT OF FILAMENT.

use of a larger number of lamps in each sign than has hitherto been the case with carbon filament lamps. This ensures a more equal distribution of light over the entire surface to be illuminated. An entirely new pattern of motor-bus lamp, which, we are informed, is being already largely taken up by London and provincial companies, is listed for 12 volts 10 c.p. This type is manufactured in tubular shape with a bow filament (see Fig. 2).

Lastly, we would draw attention to the special lamps for medical and scientific work, which, although so small (Fig. 3), have an efficiency of approximately one watt per c.p.

A miniature list of these lamps is also available.

## "WOTAN" BATTERY LAMPS

A NUMBER of improved "Wotan" drawn-wire battery lamps are included in the revised list just issued by Siemens Bros. Dynamo Works, Ltd. (Incandescent Lamp and Fittings Department, Tyssen Street, Dalston, N.E.).

AUTOMOBILE HEAD LAMP.

We illustrate the focussing type lamp with helical filament for automobile headlights, &c. A committee of the Society of Motor Manufacturers and Traders has been working on the important problem of the standardisation of lamps for automobile lighting, and the automobile lamps put on the market are designed in accordance with the anticipated recommendations of this committee. Flash-light, flame, festoon, and tubular lamps are also listed in variety, while there is a number of lamps suitable for sign lighting, illumination schemes, &c. A neat folder suitable for overprinting with name and address of retailer, is available, and can be supplied to any trade customer. Messrs. Siemens state that it is their intention to circularise the trade with these lists, and they anticipate that under the new conditions the turnover in these types of lamps will greatly increase.

**Incandescent Lamp Cartons.**—We have received from the Britannia Folding Box Co., Ltd. (Dacre Road, Old Ford, E.), a sample of a patent folding carton for metal filament lamps. This is used by at least one well-known firm of lamp manufacturers. Holes are provided at the ends for the accommodation of the cap and pip, and a circular inspection hole is provided in one side.

**Electric Bull's-eye Lanterns for the Police.**—An order has been placed for 600 dry-battery tungsten lamp torches by the Port of London Authority for the use of the Dock Police. A contract for the supply of 600 dozen refills has also been entered into. The torches themselves do not differ greatly from those already on the market, but the joints and switch have been strengthened. It has been stated in the daily Press that the City of London Police are to be equipped with electric bull's-eye lanterns in place of the present oil bull's-eyes. We are in a position to state, however, that neither the City nor Metropolitan Police have yet so decided, although tests have been carried out with different makes of lanterns for the last two or three years. A lantern with an unspillable storage battery will, however, probably be adopted in the early future.

## CENTRAL SUSPENSION LIGHTING

IN connection with the Road Board's recent pronouncement in favour of central suspension lighting, and pending also the settlement of the compulsory powers which are being sought in various towns to attach brackets to buildings,

CENTRAL SUSPENSION LIGHTING, USING TROLLEY POLES.

it may be noted that existing tramway pillars may in many cases be utilised for carrying the span wire for the support of arc or metal filament lamps. The general arrangement of the system devised by The London Electric Firm (George Street, Croydon) is shown in the illustration.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Dorking.**—Messrs. Edmundson's propose to extend the supply to Westcott, at an estimated cost of from £2,000 to £2,500.

**Congleton.**—The Rural District Council requires additional cable for its sewage disposal works, at an estimated cost of £400.

**Dundalk.**—Electrically-driven pump, washing and wringing machine, at the workhouse. Clerk to Guardians.

**Inverurie.**—The Council is inquiring of the Great North of Scotland Railway Co. upon what terms it would give a supply of electrical energy in bulk from its power station in the district.

**Leeds.**—A twelve months' supply of cable, lamps, fittings, &c., is required by the Electricity Department. February 21st. (See advertisement on another page.)

**London: Hackney.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £200 for apparatus for automatically controlling the voltage of the alternators at the power station.

**Loughborough.**—The L.G.B. has sanctioned an expenditure of £11,000 upon new buildings and plant, and £3,000 on new mains and services.

**South Africa.**—The Paarl Council has approved plans of an electric lighting scheme at an estimated cost of £35,000. Particulars will shortly be available at 73 Basinghall Street.

**Wolverhampton.**—Extensions of mains to Goldthorn Hill are contemplated at an estimated cost of £129, and in Walsall Street at £210. In order to meet the increased supply in the Tettenhall Road district, the School Street sub-station and the Chapel Ash sub-station are to be connected up at an estimated cost of £110.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Bolton.**—Cinematograph theatre in Blackburn Road.

**Hythe.**—New concert hall. Town Clerk.

**London.**—Block of flats in the Adelphi. Architect, E. Cannell, 28 Martin's Lane, E.C.

**Manchester.**—Extensions of exchange (£600,000).

Electric lighting of Chorlton-cum-Hardy Library. Town Clerk, January 26th.

**Nottingham.**—Conversion of Caledonian Hotel, Listergate, into General Stores.

New Drill Hall in Exchange Street, Retford. Territorial Association.

**Sunderland.**—New cinematograph theatre, Main Street.

## Miscellaneous

**Birmingham.**—The Birmingham, Tame and Rea District Drainage Board requires a twelve months' supply of electrical stores. February 11th. Engineer, Board Offices, Tyburn.

**Llandudno.**—Arrangements have been made between the Llandudno and Colwyn Bay Electric Railway and the Council concerning certain street widenings, and the extension of the line to Old Colwyn is to be commenced very shortly.

**Salford.**—Electric lifts at the Town Hall. J. B. Broadbent, 15 Cooper Street, Manchester.

**Tasmania.**—The Deputy Postmaster-General, Hobart, requires 200 common battery telephones. Further particulars at 72 Victoria Street, S.W., and 73 Basinghall Street, E.C. Tenders by March 2nd.

**West Ham.**—Various stores for Electricity Department. Town Clerk. February 6th. (See advertisement on another page.)

## TENDERS RECEIVED AND ACCEPTED

**Admiralty.**—The Edison & Swan United Electric Light Co. have received a twelve months' contract from the British Admiralty for the supply of ampere gauges, from 15 to 500 amperes.

**Bradford.**—A recommendation of the Electricity Committee that an order should be placed with a Berlin firm for the turbo-alternator advertised in our issue for November 27th, 1913, has caused much comment, and it is possible that serious protests will be made before the matter is finally settled by the Corporation.

The Council has accepted tenders amounting to £18,270 for the supply of railless cars and equipments.

**Dundee.**—In connection with the extensions which are under consideration a repeat order has been placed with Willans and Robinson for a 5,000-kw. (Willans-Dick, Kerr) turbo-alternator and condensing plant.

## APPOINTMENTS AND PERSONAL NOTES

Lieutenant-Colonel Fowler, Commandant of the Army Signalling School, has been added to the Committee on Research in Wireless Telegraphy, appointed by the Postmaster-General a few months ago.

Colonel C. H. Wright, who has been Chairman of the Electricity and Gas Committees at Stafford for fifteen years, has been presented with a pair of silver tureens by the staffs on the occasion of his resigning from that position.

The Doncaster Corporation requires two pupils for its electricity works. Premium £50, with small salary. Applications to Borough Electrical Engineer by January 30th.

A colliery electrician is required for a small A.C. and D.C. installation. (See advertisement on another page.)

A correspondence clerk is required. (See advertisement on another page.)

A boiler-house fitter is required in the Bristol Corporation Electricity Department. (See advertisement on another page.)

Plumber-jointers are required at Prescott. (See advertisement on another page.)

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Electric Construction Co.**—An interim dividend at the rate of 7 per cent. has been declared upon the preference shares for the half-year to November 30th.

# OSRAM

## LAMPS

### Important Notice

## JUDGMENT

THE OSRAM LAMP WORKS, LTD., beg to inform the Trade and the Public that on October 31st, 1913, in the High Court of Justice, Chancery Division, Mr. Justice Astbury **GRANTED AN INJUNCTION** against **THE YORKSHIRE INCANDESCENT ELECTRIC LAMP CO., Ltd., Concord Street, Leeds,** (by consent of Defendants), in the action against them instituted by the OSRAM LAMP WORKS, Ltd., for infringement of OSRAM Patents 23899\* of 1904 and 18622 of 1906, the validity of which had been previously certified by the Court. The lamps complained of in such action were marked

### "Y.R." LAMPS

IT WAS FURTHER ORDERED that the Defendants deliver up to the Osram Lamp Works, Ltd., or destroy in the presence of their representatives, all such infringing lamps in their possession, and that an inquiry be held to ascertain what damages have been sustained by such infringement, and that the Defendants pay the Osram Lamp Works, Ltd., their full costs, charges, and expenses in the action as between solicitor and client.

**WARNING! Dealers in and users of similar infringing lamps will be proceeded against.**

## LOCAL NOTES

**Blackpool: Electricity Tariff.**—The rateable value tariff has been suggested by Mr. C. Furness, the Borough Electrical Engineer, who reports also that since the introduction of the  $\frac{1}{4}$ d. tariff for cooking and heating in 1908, 400 radiators have been connected to the mains. Regret is expressed, however, that more progress has not been made with the electric cooking outfits, and in this direction a special effort is to be made by the Department.

**Carlisle: Electricity v. Gas.**—At the last meeting of the Corporation a long discussion took place upon a motion by the Gas Committee recommending that the Council should order that when the Electricity or Gas Departments are requested to quote rates for lighting or power to the same consumer, the Committees should confer before any quotation is made, with a view to preventing unnecessary competition and cutting of prices. This was strongly resented by the Electricity Committee, the Chairman of which argued that the electricity undertaking should be allowed to develop unfettered by any such restriction. Eventually, however, the Council passed the Gas Committee's recommendation by twenty votes to sixteen.

**Cromer: Transfer of Electricity Undertaking.**—The Council has agreed with Messrs. Edmundsons Electricity Corporation that the electricity works shall be transferred to the Company as from March 25th next.

**Edinburgh: Electricity Reserve Fund.**—At the last meeting of the Corporation, Bailie Stevenson, Convener of the Electricity Committee, moved that the Corporation should increase the maximum of the reserve fund of the electricity undertaking from the statutory 10 per cent. of the capital expenditure to 15 per cent., provided that the payments into the fund in excess of the present maximum shall not exceed  $1\frac{1}{2}$  per cent. per annum of the total capital expenditure. There was very considerable opposition to the proposal, as also was there to a suggestion that the matter should go to the Treasurer's Committee for consideration. Eventually the debate was adjourned to allow the Town Clerk and City Chamberlain to prepare a detailed report on the matter. The point of objection to the scheme was that by increasing the reserve fund in this way, either the consumers will be debarred from legitimate reductions in price, or the ratepayers will be prevented from receiving benefits from the electricity undertaking which they otherwise would do. On the other hand, the object of the recommendation, it was pointed out, was that £100,000 will have to be spent in the near future upon a new power station which for a little while would be unremunerative, and the only way of recovering this deficit was either by increasing the charges to consumers, or calling upon the reserve fund. This at present is up to the full limit of the 10 per cent., but the Committee do not think it wise that it should go below this, and consequently recommended that it should be increased, and thus obtain a sum in hand over the 10 per cent. by the time the extra capital expenditure was to be made.

**Galashiels: Electric Lighting.**—Messrs. Buchan and Partners, Consulting Engineers, of Edinburgh, have been appointed to advise the Council with regard to the provisional order now being promoted by the Galashiels and District Electric Supply Co. A number of petitions have been lodged against the Company's order, but most of them are merely to preserve a *locus* in the event of disagreements over details.

**London: Electricity Supply.**—The Bill of the County of London Electric Supply Co., as hinted in our last issue, in these notes, is likely to meet with considerable opposition from the London Borough Councils. It is stated that a defensive alliance is to be entered into in order to protect the Borough Councils from any action from outside sources which might be detrimental to their interests.

**Manchester: Purchase of Trafford Park Co.**—In spite of the adverse criticism which has been made recently concerning the proposal of the Corporation to purchase the Trafford Power & Light Supply, Ltd., the project was approved by a ratepayers' meeting last week.

**New Zealand: Lake Coleridge Power Plant.**—This power plant is anticipated to be in operation by May. The total capacity of the works will eventually be 9,000 kw., and supply will be given to Christchurch, and fifteen other local bodies, as well as to the Christchurch-Lyttelton suburban railway. At present about 6,000 kw. of plant has been installed.

**Oldham: Street Electric Lighting.**—At the last meeting of

the Electricity Committee, the Chairman moved that the Lighting Committee be asked to give more consideration to the use of electricity for street-lighting purposes. The resolution was carried.

**Surbiton: Electricity Undertaking.**—Mr. J. F. C. Snell has reported upon the position of the electricity undertaking, and a meeting is to be held at which representatives of Messrs. Callender's, who are managing the works, will attend to discuss the matter with the Electricity Committee and Mr. Snell.

**Taunton: Water Power Plant.**—A recommendation by the Main Drainage Committee that advice should be taken as to the utilisation of certain local water power for generating electricity was lost at the last Council meeting. The Borough Electrical Engineer expressed the opinion that any expense in this direction would be more profitable if devoted to the installation of extra steam plant in the existing power station.

**Teignmouth: Electric Lighting.**—We recently reported that the Council had decided not to undertake a municipal electric supply scheme, but to give facilities to a company. As a result, the Bovey Tracey Electric Light Co. has written concerning a possible supply in bulk, whilst Dr. Purves, of Exeter, is also negotiating with regard to a scheme.

**Worcester: New Plant.**—A new 2,000-kw. turbo-alternator set, manufactured by Messrs. Heenan and Froude, was put into operation at the power station last week. This plant, together with the necessary boiler-house extensions, has involved an expenditure of about £8,000.

**Yorkshire: Opposition to Power Co.**—The Yorkshire Electric Power Co.'s Bill, which proposes to take powers to distribute electricity in districts in its area where no provisional orders exist, is arousing considerable opposition from a number of urban district councils and rural district councils in the Company's area, and there are signs of a lively Parliamentary fight unless some agreement can be come to in the meantime. A large number of oppositions have been deposited at Westminster.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £66 10s. to £67. (Last week, £65 10s. to £66.)

**The "Z" Half-watt Lamp.**—The address of the "Z" Electric Lamp Manufacturing Co., Ltd., was incorrectly given in a note which appeared in our last issue. The Company's address is Orient House, New Broad Street, London, E.C.

**Agencies.**—The names of seven firms at Sydney (N.S.W.) who desire to obtain agencies for British electrical firms, are on file at 73 Basinghall Street, E.C.

**Change of Telephone Number.**—W. T. Henley's Telegraph Works Co., Ltd. (Blomfield Street, London Wall, E.C.), now has seven telephone lines, and the telephone number has been changed to London Wall 4560.

## NEW COMPANIES

**ELECTRICAL SERVICES.**—This Company has been registered in Bradford with a capital of £1,000. One of the subscribers is Mr. L. V. B. Burrows, Electrical Engineer, Horton Lane, Bradford.

**BRITISH CENTRAL ELECTRICAL CO.,** 6-8 Rosebery Avenue, E.C. Capital £3,000. To take over the business of the British Central Electrical Co. now carried on by E. S. Conradi and J. F. Conradi.

**TRANS-OCEANIC WIRELESS TELEGRAPH CO.,** Marconi House, Strand, W.C. Capital £200,000. To acquire from Marconi's Wireless Telegraph Co. certain lands and rights in the counties of Carnarvon and Merioneth, together with the wireless telegraph station now in course of erection there, and the sole licence to use the Marconi system between Great Britain and certain stations in the United States. First directors are G. Marconi, Godfrey Isaacs, Captain H. R. Sankey, and M. A. Braunstein.

**INDIAN RAILLESS TRACTION CO.**—Capital. £5,250. Registered by Jordan & Sons, 116 Chancery Lane, W.C. To carry on in India the business indicated by the title.

**COLSTON ELECTRICAL WORKS,** 9-10 Denmark Street, Bristol. To take over existing business of Messrs. Parfitt, Webber and Co.

## SUMMARY

THE fact that the Bradford Corporation has placed an order for a 5,000 kw. turbine with a Berlin firm has given rise to much comment. It is stated that the tender was not the lowest, and that the British manufacturers, while willing to accept the penalties for steam consumption higher than that guaranteed, required a wider margin before absolute rejection of the machine on this account. (Page 58.)

THE Electrical Trades Union is increasing in strength and confidence, and at a meeting of workmen held at Caxton Hall on Tuesday night, at the invitation of the London Electrical Masters' Association, a resolution was passed referring the appointment of delegates to meet the masters to the Union, in conjunction with the Association of Central Station Engineers. The electricity supply workmen, we believe, however, have no real desire to be concerned in the present dispute. (Page 59.)

A FEW more letters from central station engineers, with regard to the prospect of the half-watt lamp in their districts, appear on page 60.

A LETTER from a well-known maker of arc lamps objects to the suggestion that half-watt lamps will supersede arc lamps for street lighting. (Page 60.)

AT the annual dinner of the British and Allied Manufacturers' Association, Mr. F. E. Smith spoke in strong terms on the award of the tender for the new Bradford turbo-alternator to a German firm. (Page 61.)

THE annual report of the B.E.A.M.A., passed last week, records considerable activity in several useful directions. (Page 61.)

MR. A. H. SEABROOK's statement in his address to the "Point Fives," that 6d. per unit for lighting was a competitive price with gas at 2s. 6d. per 1,000 cub. ft., was challenged in the discussion. The author gave it as his experience that it was possible to obtain even 8d. One reason why the rateable value basis was better than the "connected load" basis was that inspections were unnecessary, and another reason was that even if the lamp efficiency was improved the lighting income would be maintained. Some districts now have an all-night heating load. (Page 62.)

SOME effects observed when the rotor of a three-phase induction motor has a loose connection are discussed in our "Questions and Answers" columns. (Page 62.)

DURING Mr. A. A. Campbell Swinton's Inaugural Address to the Wireless Society of London messages were received from the Eiffel Tower on an aerial erected for the purpose. The received energy worked a Brown relay, which in turn worked two others, and finally the message was written by a syphon recorder, and, by means of a Lietz Projector, the actual working of the apparatus was clearly shown on the screen.—We refer also, under "Telephony and Telegraphy," to the magneto switchboards which are supplied with combined jacks and indicators by the Peel Conner Telephone Works.—Some notes are also given on a new publication dealing with the quenched spark system of wireless telegraphy for ships developed by Siemens Bros. & Co. (Page 63.)

OUR "ELECTRICAL ENGINEERING Literary Section" contains a list of new publications, reviews of a number of technical books, and gives a selected list of recommended works on all branches of electrical engineering. (Page 64.)

PATENT No. 2,222 of 1900, by A. Wright and The Reason Manufacturing Co., for a construction of electrolytic mercury meter expires during the week after a full life. A patent for winding a number of coils simultaneously on a common core, by J. Scott, R. Varley, and J. S. Anderson, also expires after a full life. The specifications published last week include one for starting synchronous motors by E. Rosenberg, one for a construction of filament and spider for metal filament lamps by H. Zschocke, and one dealing with trolley omnibuses for running on tramway tracks by E. Cross. (Page 69.)

A DESCRIPTION is given of some new fittings specially designed for half-watt lamps. (Page 70.)

MR. B. M. JENKIN is retiring from the firm of Kennedy and Jenkin. (Page 71.)

CONSIDERABLE extensions to generating plant and

mains are contemplated at Huddersfield, Belfast, Liverpool, Gravesend, Aldershot, and by the Yorkshire (W.R.) Electric Tramways Co.—Various stores are required by a large number of electricity departments. (Page 71.)

THE General Electric Company, Ltd., in connection with Messrs. Pirelli, Ltd., are erecting a large cable works in Southampton for the manufacture of all classes of cable. It is expected that manufacture will commence in May or June. (Page 72.)

THE Glasgow Electricity Committee is considering the hiring out of cookers and other domestic electrical appliances.—Tests of electricity and gas for street lighting are being carried out at Leicester.—Vibration is alleged from the Diesel engines at the Aldershot electricity works.—A special report is to be drawn up on the financial position of the Southampton Electricity Department. (Page 72.)

### ARRANGEMENTS FOR THE WEEK

FRIDAY, JANUARY 30TH.

*Institution of Electrical Engineers: Newcastle Section.*

7 p.m. At Hugh Bell School, Middlesbrough. "Reactance and Reactance Coils in Power Circuits," by E. P. Hollis.

SATURDAY, JANUARY 31ST.

*Association of Mining Electrical Engineers.*

5.30 p.m. Warwick and S. Staffs Branch. At Imperial Hotel, Birmingham. "Practical Notes on Colliery Electrical Equipment," by J. F. Aust.

TUESDAY, FEBRUARY 3RD.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal School of Technology. "Rotary Converters," by E. C. H. Slater.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. At Princes Street Station Hotel, Edinburgh. "British Practice in the Construction of High Tension Overhead Transmission Lines," by B. Welbourn.

THURSDAY, FEBRUARY 5TH.

*Institution of Electrical Engineers.*

7 for 7.30 p.m. Annual Dinner at Hotel Cecil.

### The London Electrical Engineers.

(TO-DAY) THURSDAY, JAN. 29TH.—C. Company. Technical Instruction, 7 to 10 p.m.

FRIDAY, JAN. 30TH.—D. Company. Special Class on Crossley Engine, 7 to 8 p.m. Technical Instruction, 7.30 to 9.30 p.m.

SATURDAY, JAN. 31ST.—Headquarters open from 10 a.m. till noon.

MONDAY, FEB. 2ND.—A. Company. Technical Instruction, 7 to 10 p.m.

TUESDAY, FEB. 3RD.—B. Company. Technical Instruction, 7 to 10 p.m.

WEDNESDAY, FEB. 4TH.—Recruits only. Recruit Instruction and Technical Instruction, 7 to 10 p.m.

THURSDAY, FEB. 5TH.—C. Company. Technical Instruction 7 to 10 p.m.

FRIDAY, FEB. 6TH.—D. Company. Technical Instruction, 7 to 10 p.m.

SATURDAY, FEB. 7TH.—Headquarters open from 10 a.m. till noon.

### THE GERMAN TURBINE FOR BRADFORD

THE Bradford Corporation has accepted the tender of the Adnil Electric Co., Ltd., for a Bergmann turbine of 5,000-kw. capacity at 0.8 per cent. power factor, capable of standing an overload of 25 per cent. for two hours, and running at 1,500 r.p.m. The turbine is to be made in Berlin. We understand that the specification demanded certain steam-consumption guarantees, but that it was open in respect to the type of turbine, it being left to the contractor to tender for either an impulse or reaction type, and for a speed of 1,500 or 3,000 r.p.m. The amount of the accepted tender was £9,370. Visits were paid by a deputation from Bradford to inspect large steam turbines on the Continent, and also to inspect the Bergmann works in Berlin before the order was placed.

There has been much comment upon the matter, both locally in Bradford and in electrical engineering circles generally, and it is openly stated that the accepted tender was not the lowest. Considerable reticence, however, is being maintained as to the exact facts. We believe that some difference of opinion arose as to the margin to be allowed in steam consumption from the specified guarantees. Heavy penalties were to be enforced should the machine not come up to guarantee in this respect, and we understand that these were accepted by all the firms tendering, whether British or Continental. The British firms, however, insisted on a margin of 10 per cent. before absolute rejection of the machine, while the successful tenderer was satisfied with a smaller margin. The matter was referred to in Mr. F. E. Smith's speech at the B.E.A.M.A. dinner, reported on another page of this issue.

**EXPERIENCED WIREMAN** (to young and enthusiastic Trade Unionist):—Not so much of your Caxton Hall manner with me, young man. You may get a rise, but you won't get 11d. an hour yet awhile, and I know you don't expect it. And, take my advice, leave the central station workmen alone; they won't thank you for making trouble,—you and your pictures of arc lamps off the scrap heap and toy dynamos.

## THREATENED STRIKE OF ELECTRICAL WORKERS

THE situation has assumed a new aspect, after the meeting held at Caxton Hall on Tuesday night, a report of which, as well as a report of a meeting of the Electrical Trades Union on Monday, appears below. It would appear from the voting at the meeting at Caxton Hall, that among the workmen employed by the wiring firms represented in the London Electrical Masters' Association, there is now a preponderance of men who are either members of the Electrical Trades Union, or are in sympathy with it. This need not be taken absolutely for granted, however, as there are several firms employing non-union workmen who did not take steps for representatives of their men to be chosen to attend the meeting. It is not quite clear what significance is to be attached to the statement made by Mr. Tate, the Secretary of the Masters' Association, that he "accepted" the Trade Union amendment, but the effect of the amendment is clearly that the Electrical Trades Union and the Association of Central Station Engineers will appoint representatives whom they will confidently expect will be invited to meet the Masters in conference on the wages question. It is greatly to be regretted that an endeavour is being made to drag in central station workmen, who have nothing at all to do with the present dispute in the building trades, and have at present shown no sign of discontent. The majority of the central stations in London, for the latter reason, did not post up the notices inviting their workmen to appoint delegates to Tuesday's meeting, and the Association of Central Station Engineers, which was not originally formed as a workmen's union, is still a body of more or less technical engineers rather than of workmen, although apparently some of the forward spirits would have no objection to its developing into a "fighting organisation." The membership is composed of shift, sub-station, mains, and charge engineers; it does not include meter readers, jointers, or arc-lamp men. The total membership, all over the United Kingdom, is 1,500, of which 450 to 500 are in London; the charge engineers, &c., in the municipal stations are well represented on it, and also a good many men, we are told, in the railway power houses, but so far the Association has not been as successful in enrolling numbers of men from the supply company's stations.

The meeting of the Electrical Trades Union was held at the Memorial Hall, Farringdon Street, on Monday night. Non-unionists were invited, with the object of explaining to them how their status and rate of wage might be improved. The meeting was to have been presided over by Mr. S. Stennett (Chairman of the London Building Industries Federation), but owing to the lock-out by the London Master Builders' Association he found himself too busy in other directions, and the Chair was taken by Mr. J. Buchan (District President of the Electrical Trades Union). There were probably nearly 1,000 workmen present.

At the outset the Chairman said that as the meeting was composed of both unionists and non-unionists, it was not intended to go into any definite attitude of policy in the present dispute. All they desired to do was to endeavour to convince the non-unionists that without organisation it was absolutely impossible for the human race to progress at all. Speeches enlarging upon this point of view were also made by Mr. J. Potter (District Secretary of the Electrical Trades Union), Mr. C. W. Bowerman, M.P., Mr. J. Kinniburgh (Organising Secretary of the Electrical Trades Union), Mr. J. Stokes (Chairman of the London Trades Council), and others, and in the course of these speeches it was said that the object now being aimed at by trade unionist leaders is to federate all the unions into one in order to make it impossible for any man to get a job unless he is a member of the Union.

With regard to the dispute between the electrical workers and the electrical employers of London, and the new card of Working Rules set out on page 45 of our last issue, it was pointed out that this is merely a commencement, and that the ultimate demand will be for 1s. per hour for electrical wiremen. The London electrical contractors in general, and those on the Committee of the London Electrical Masters' Association in particular, naturally came in for severe criticism, and special mention was made of the firms of Blackburn, Starling and Co., Duncan Watson and Co., and Taylor and Co., whilst

to the whole body of electrical employers the term "unscrupulous" was freely applied. In reference to the meeting called by the masters for the following night, a hint was given to the men that they should try to prevent the passing of the resolution to form a committee consisting of twelve employees and twelve employers, for the reason that the men's representatives might not in that event consist of union officials. Equally severe was a criticism of Mr. Leonard Tate in regard to his suggestion of the grading of workmen with a graduated scale of wage, and the possibility of the Union holding up every form of electrical work was suggested if anything like a large percentage of electrical workers in London can be got into the Union.

The following resolution was put to the meeting and carried unanimously:—

"This mass meeting pledges itself to support the Electrical Trades Union to enforce the wages and conditions which have been placed before the employers in our trade card."

The mover of the resolution pointed out that the proposed increase from 9½d. to 11d. an hour for electrical wiremen represented 3s. 10d. per week of fifty hours, which amounted to 87 per cent. of the 168 per cent. increase in living expenses since 1900, whilst it was hoped that, as the strength of the Union increased, it would be possible to demand the remaining 81 per cent. deficiency from which it was alleged the men are now suffering.

Two interesting pieces of information were announced during the evening. One was that the membership of the Union is 1,600, whereas the Organising Secretary thinks it should be between 4,000 and 5,000, and the other was that the whole of the employees in the Electricity Department of the St. Pancras Borough Council have joined the Union. The tone of the speeches was singularly uneven, for whereas Mr. Bowerman and one other speaker counselled the men to go about their self-imposed task in an orderly manner, the Chairman unfortunately urged the men to proceed on the lines of getting as much as they can and giving as little as possible in return. The inference to be gained from the speeches of the leaders of the men is that their lot will be thrown in with that of the building trade generally, and that none of the men employed where building work is in progress will return to work unless all sections have their demands satisfied.

The meeting convened by the London Electrical Masters' Association on Tuesday was for the purpose of bringing together representatives of unionist and non-unionist workmen, with a view to forming a workmen's committee of twelve to meet a similar committee of the masters.

Mr. J. H. BOWDEN (Borough Electrical Engineer, Poplar) was in the chair, and some 150 workmen's delegates were present, in addition to a considerably smaller number of representatives of the masters. The delegates represented both wiring contractors and (to a very limited extent) supply station men.

Mr. LEONARD TATE (Secretary of the London Electrical Masters' Association) proposed the following resolution:—

"That a Committee of Workmen's Representatives be appointed consisting of twelve members (not more than one representative from any one firm) to meet the Committee of the London Electrical Masters' Association with a view to agreeing Working Rules, and terms and conditions of employment."

As was anticipated, the trade unionist workmen, who were considerably in the majority, refused to accept the resolution, and, indeed, they had been instructed by the Electrical Trades Union not to elect union men to sit on any committee which also contained non-union men. On behalf of the Union an amendment was proposed, which was finally carried in the following form:—

"That the resolution put forward by the London Electrical Masters' Association be referred to the Electrical Trades Union and the Association of Central Station Engineers."

Before this was put to the meeting it was indicated that a number of non-unionists who were present were also in favour of, and would vote for, this amendment.

So far as the representatives of the Masters' Association who spoke were concerned, the impression given by speeches from Mr. W. R. Rawlings, Mr. G. E. Taylor, and Mr. Duncan Watson was that they are only too anxious to meet representatives of the men with a view of considering the question of an increase in wages, and that although many of the contractors in London have been severely criticised for employing non-union labour, it is the invariable practice not to inquire of the workmen whether or not they are union men, and at the same time to pay them the rate of wage, irrespective of any minimum fixed by the Union, which their usefulness to their firms entitles them to. The point in dispute has always been the difficulty with regard to the position of non-union men, whom the masters do not wish to see forced out of the trade by any action of the Union, and although the Union men frequently cheered when the masters stated they were prepared to pay Union rates to a good man, this does not clear away the difficulty, as the subsequent proceedings clearly showed that the aim of the Union is to prevent any non-union men from working on any building job in London. Indeed, the mover of the amendment to the resolution told the masters quite plainly

that in fighting the Electrical Trades Union on this point they were also fighting the whole of the building trade in London, with whom the Union was working.

Towards the close of the proceedings, when the amendment was being put to the meeting, considerable discussion took place as to what was actually intended.

Mr. TATE said that when he put this resolution before the meeting he had assumed, in the innocence of his heart, that union and non-union men would have an equal chance of sitting on the proposed Committee. He had, however, been informed by a responsible member of the Electrical Trades Union that if the original resolution were carried, no union men would be allowed to sit upon the Committee. He was exceedingly sorry to hear this, and in the circumstances he had consulted with the Chairman, and felt they had no alternative but to accept the amendment. He took it that Mr. Muir, the mover of it, wished to refer the masters' resolution back to the place whence it came, i.e., the Masters' Association, and to couple with that the other two organisations, namely, the Electrical Trades Union and the Association of Central Station Engineers.

Mr. MUIR said that asking for non-union men to be upon the Committee was only asking for war. The Electrical Trades Union now had 1,800 members enrolled, and as the representative body it could not recognise rules drawn up by any Committee containing non-union men.

Mr. TATE said that, as he had pointed out before, this attitude forced the masters into accepting the amendment, but at the same time he would like to know if the Union would be prepared to have on this Committee representatives from firms employing non-union men.

Mr. MUIR said that as a District Committeeman of the Electrical Trades Union he could not possibly give any undertaking. The masters must resume negotiations with the responsible body.

The CHAIRMAN then desired to put the amendment in the following form:—"That the resolution put forward by the Electrical Masters' Association be referred to the Electrical Masters' Association and the Electrical Trades Union."

Mr. MUIR said he could not accept that. He wished to refer the masters' resolution to the Electrical Trades Union and the Association of Central Station Engineers.

Mr. TATE said he had not understood that.

Mr. MUIR said that, according to the rules of the Union, all negotiations in relation to finance of the Union must be carried on through the Executive Committee.

The CHAIRMAN: You mean that the resolution put forward by the masters should be referred to the two organisations, the Electrical Trades Union and the Association of Central Station Engineers?

Mr. MUIR: Yes.

As stated above, the amendment was then put and carried by a substantial majority.

## PROSPECTS OF THE HALF-WATT LAMP

WE have received a few more letters from Supply Station Engineers in various parts of the country, in reply to our inquiry as to the prospects of the half-watt lamp in their districts. Extracts from previous letters were published in our issues of January 15th and 22nd.

LANCASTER.—MR. G. C. MILNES thinks it probable that the half-watt lamp will have a considerable effect on the street-lighting problem in Lancaster, and that there is also a field there for the use of these lamps for outside shop-lighting. Lancaster has just recovered from the effect of the introduction of the tungsten lamp, but will give the half-watt lamp a hearty welcome, particularly down to the 200 c.p. units.

BISPHAM-WITH-NORBRECK.—MR. J. S. HOLLINRAKE points out that this was one of the stations which was made possible by the introduction of the one-watt lamp. They have in only two years connected up 160 houses out of a total of about 600, but with the carbon filament lamp it would have been madness, he says, to have installed the plant, and to have competed with gas there. If they were to get the half-watt lamp in the smaller sizes, the reduction of the output would only be temporary.

DARTFORD.—MR. J. D. PEMBER writes: "In a town of moderate size such as Dartford, largely inhabited by the working classes and possessing no large shops, the present price of the half-watt high-voltage lamps will be prohibitive. For £2 one can get a miniature arc lamp, and a couple of these will light a Dartford shop window; or a cluster of, say, three 100 c.p. M.F. lamps will be equally as effective, and much cheaper in first cost. Then the renewals are so much cheaper that the consumer can afford to pay rather more for current supplied than if he used the half-watt lamps. In these smaller towns it is getting quite a moot point as to whether it pays to couple up the smaller lighting consumers at all, even with one watt per c.p. lamps installed. A single fault on a main, or a faulty length of main, may cost more to repair than the total yearly

receipts from the consumers connected thereto. I have at present to re-lay 70 yards of main originally laid too deep in the roadway, so that it is below the level of the high tides, and consequently often water-logged, and on this main is one small consumer only, whose total annual bill is less than one-fifth the cost of relaying this length of distributor."

WILLESDEN.—MR. A. W. BLAKE welcomes the half-watt lamp, but does not anticipate any effect on his load until there has been a substantial reduction in the cost. In the sizes now available he sees no advantage in comparison with good flame lamps except for isolated positions, owing to the running cost of the latter being very much lower, especially as he estimates the efficiency of the half-watt lamp as 0.75 watts per candle, after "toning down."

GRIMSBY.—Some words were accidentally omitted in quoting from Mr. W. A. Vignoles' letter in our issue of January 15th. Mr. Vignoles said: "I find it extremely difficult to get my customers to pay sufficient attention to arc lamps to ensure satisfactory results." The words which we have italicised were those omitted.

## CORRESPONDENCE

### HALF-WATT LAMPS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—From the numerous letters appearing in your two last issues giving the opinions of engineers as to the probable value of the new half-watt lamp for electrical uses, we notice a great tendency on the part of a number to hail the newcomer with an enthusiasm which certainly it does not deserve in the cases, as it refers generally to the displacement of flame arc lamps, and particularly to those used for street lighting and for such similar work. A similar impression seems to prevail in other quarters, for even in one of your contemporaries we notice an editorial article dealing with this matter, from which one can only assume that the arc lamp is to be regarded as being upon its last legs. We can only suppose that those who have so rashly stated their views have not fully considered the matter, and in consequence we think you will allow us, as magazine flame arc lamp manufacturers of the latest and most improved type, to protest against this destructive criticism, which will not bear the light of actual fact.

Simple calculation of the various factors of cost for comparing the one system of lighting with the other will quickly show that the modern flame lamp has no fear whatsoever of being superseded in any instance where cost of light delivered is the determining factor, as is now universal in the most important work. The renewals, &c., of the half-watt lamp cost more than the carbons, trimming, attendance, depreciation, and interest on capital of the flame lamp; and, again, the cost for energy of the latter for equal candle-power is one-third to one-fifth of that of the former. To those who may care to calculate this last item at one halfpenny per unit only will find that the production, say, of 3,000 candle-power for an assumed year's burning of 4,000 hours will result in a saving of several pounds per annum in favour of the arc lamp.

We are far from saying that the half-watt is unsuitable to replace the arc lamp, for in some cases it is only too obvious that it will do so, and particularly is this the case where the high efficiency is not desired. The one-watt lamp, however, we believe has tapped this field already, and whilst the half-watt lamp may still further slightly encroach on the arc lighting field, it seems to be more a probability that the half-watt, if it be made in suitable sizes, will be likely to replace the one-watt lamps as now used for less important street and similar lighting than the arc lamp. Many seem to regard the new lamp as a new weapon to fight the high-pressure gas; candidly, from our own experience in severe competition with gas in street lighting, we consider it will require a lamp having a higher efficiency than one of half a watt per candle to defeat the enemy in these cases, and there is no lamp we know of other than the modern magazine flame arc lamp that has a sufficient margin in hand to ensure a successful competition. In conclusion, we hope in the interests of all concerned that a sane view will be formed in good time as to the sphere in which the new lamp may usefully be employed, for the sooner this is realised by manufacturers and users the sooner will the various electrical interests settle down and work for the good of the industry as a whole.

Yours faithfully,

OLIVER ARC LAMP, LTD.,

CHARLES OLIVER, Director.

University of Liverpool.—The prospectus of the Engineering Faculty of the University of Liverpool for the session 1914-15 may now be obtained on application to the Registrar, Mr. E. Carey. The session will begin on October 8th. The head of the electrical engineering department is Professor E. W. Marchant, and Professor J. A. F. Aspinall is lecturer in railway engineering.

## THE B.E.A.M.A. DINNER: Mr. F. E. SMITH ON THE BRADFORD TENDERS

THE annual dinner of the British Electrical and Allied Manufacturers' Association was held at the Savoy Hotel, on Wednesday last week, under the presidency of Lord Amthill.

Mr. A. BRUCE ANDERSON (Chairman of the Council), proposing the toast of "The Guests," said, in the course of his speech, that it was difficult to arrive at agreements with other responsible sections of the industry if individuals whose ideas coincide neither with those of the Association nor of the leaders of their own bodies took independent action. He regarded, however, the hearty co-operation of manufacturers as only one step in the direction of a consolidated industry able to protect and foster the vast interests committed to its charge. While there were points at which the immediate interests of various sections of the industry did not coincide, one had to travel but a little way to find a point where the interests of all were identical. He looked forward with confidence to the time when the industry would unite to educate the public in the increased use of electricity, both for purposes for which it was now used and in directions where we have at present made little or no advance. He was aware that there were some difficulties to be overcome. For instance, if the electrical industry contemplated a national propaganda such as is indulged in by their gas friends, one of the most important sections of the industry, namely, the municipal supply authorities, were hampered by restrictions which would prevent the large majority of them from taking part in it. The Manufacturers' Association intended to help the municipalities to get these disabilities removed. The manufacturers would doubtless be called upon, and he thought would be wishful, to take part in such a national propaganda, but what guarantee had they that if, as a result of joint efforts, additional plant and machinery was required, the orders would not go outside the Association, or even outside the country? The placing of orders abroad was embarking upon a policy which, if indulged in by everyone, would destroy the very market upon which they all lived, and be nothing short of national suicide.

Mr. F. E. SMITH, K.C., M.P., who responded first on behalf of the guests, was in his most ironical vein. He said that Mr. Anderson had spoken as though it were a misfortune if contracts which could have been carried out in England were given to manufacturers abroad. This was one of the most elementary fallacies: they had been told so for a very long time, and by persons of the highest possible authority. Surely Mr. Anderson must have forgotten that even if a big contract, say £100,000, which ought to have been carried out in this country, were given to Germany, although that £100,000 represented, perhaps, £60,000 in wages for Germans, it followed as an inexorable economic law that Germans must buy something from us. He had read that day that the Bradford Corporation had provided at a cost of £10,000 a generator for the electricity works. Several British firms sent in lower tenders—that, of course, was their ignorance and incompetence—but it was stated that the German plant was so much superior to the British that the Council had to accept the German contract. £7,000 of the contract probably represented wages. Some of them might think it was unfair, and that the money ought to have gone to those who are building Dreadnoughts to defend this country, and not to those who were building Dreadnoughts to destroy this country. If anyone thought that this was wrong, he did not grasp the elements of political economy. Although that contract had been lost to a firm of British engineers, although it was true that if the contract had been given to a British firm the wages would have been paid in this country, and the profit which would have been made would have gone in the discharge of the rates and taxes, they had forgotten that if they only bought those things from Germany she might buy something else which some other body of manufacturers made in this country, or she might even give her order in the shape of some raw material which, when developed in Germany, would be sent back here to be sold. Passing from irony to equally biting sarcasm, Mr. Smith then pointed out that Germany had virtually Free Trade for its own 70 million inhabitants and in our country as well, while we had only Free Trade in the United Kingdom—including Bradford. In conclusion, he deplored that the question of tariffs should be a party question.

Mr. DUDDELL, F.R.S. (President of the Institution of Electrical Engineers), who also responded, referred to the prospects of electricity as a means of improving agriculture by augmenting the production of crops.

Lord GEORGE HAMILTON, who proposed the toast of "The Association," said that the English engineer could boast that what he made was equal, if not superior, to the products of the foreign manufacturer, and, even if the price was higher and the quality only equal, the contract should go to the Englishman. He mentioned also the gift of £5,000 worth of instruments made by members of the Association to the Hong Kong University, and referred to at the time in our columns, and this was also alluded to by Lord AMPTHILL as an act of patriotism to ensure the good reputation of England in the Far

East. Lord Amthill also suggested that the Association should use its influence to see that an inquiry was held into the partial disuse by the Admiralty of electricity for certain purposes on battleships.

## REPORT OF THE B.E.A.M.A. COUNCIL

THE Annual Report of the British Electrical and Allied Manufacturers' Association was passed at the Association's General Meeting on Wednesday last week. Dealing with the position with regard to the standardisation of General Conditions of contract as between the manufacturer and purchaser of heavy plant, it is stated that an early agreement is looked forward to between the Association and the Institution of Electrical Engineers (the I.M.E.E. is not mentioned in this connection). Two draft sets of standard conditions of sale to govern smaller commercial and industrial transactions have also been put in circulation. Three agreements with regard to the methods to be followed in cross-tendering as between makers of steam and Diesel engines, turbines, dynamos, and condensers have had further adherents during the year; and a fourth, between gas-engine builders and dynamo makers, awaits the consent of certain of the former firms before coming into operation.

Reference is also made to the standardisation rules for electrical machinery provisionally put into circulation by the Association (referred to in ELECTRICAL ENGINEERING of May 22nd last, p. 285) pending further action by the Engineering Standards Committee, with whom the Association is co-operating closely. The standardisation of meters, and also of accessories (the latter including three-plate ceiling roses, and wall sockets and plugs, for lighting, heating, and cooking) is also in a forward state. The Committee of the Switchgear Section has given attention to the subject of electrical symbols as a basis for further standardisation, and has also to its credit the provisional settlement of many differences which previously existed as between manufacturers and purchasers and the Home Office inspectors. Two deputations waited on Mr. G. S. Ram, and it is stated that a settlement of all difficulties relating to the interpretation of the present Factory Regulations has been obtained, and that a full report will be circulated shortly. Other activities of the Council included negotiations with the Commercial Intelligence Department of the Board of Trade with regard to the annual statistical analysis and summary, successful deputations to the railway managers with respect to the classification of electric heating stoves, and another relating to switchgear.

The removal of handicaps to members' trade in Canada has been referred for expert opinion, and the Council hope that further progress can be reported within a reasonable time. Inter-trading between members of the Association is being strongly recommended, and detailed arrangements are under discussion by the various sections. The subject of the Association's patronage to municipal exhibitions has been placed on a definite footing by the creation of a Joint Committee of the I.M.E.E. and the Association. Reference is also made in the report to the gift of instruments to the Hong Kong University.

The five Members of Council retiring by rotation were unanimously re-elected.

**L.C.C. Loan Periods.**—A conference of London Borough Councils owning electricity works will be held shortly in order to discuss the present attitude of the London County Council with regard to the repayment of loans upon electricity works.

**Revocation of Power Company's Act.**—The Board of Trade has revoked the Cumberland Electricity and Power Gas Company's Act of 1906. This is one of the few cases in which the Board of Trade has been compelled to revoke the whole of a power company's powers; and it is to be particularly regretted in this instance, because, as pointed out in ELECTRICAL ENGINEERING, Vol. I., p. 111, a very interesting scheme for the use of power gas in the generation of electric power had been contemplated, the idea also being to supply gas to large consumers of electrical energy who preferred to instal their own generating plant.

**Institution of Electrical Engineers.**—The following is the result of the ballot for new members and transfers from one class to another at the meeting on Thursday:—*Members*:—C. L. Fortescue, J. McFarlane Kennedy. *Associate Members*:—Capt. Llewellyn Evans, R.E., L. F. Fogarty, L. Gillitt, A. G. Stamato-poulos, G. F. Tanner. *Graduates*:—S. D. Pahwa, E. Walker, R. Wilson-Jones. *Students*:—A. J. Bailey, G. R. Boscolo, J. T. Bromley, R. Burleigh, H. Eastman, S. Ethelston, W. L. Giller, W. C. J. Halford, A. D. Hedgecock, M. R. James, E. C. Johnston, S. G. Killingback, R. F. J. Maidment, J. Mould, P. R. Nath, A. C. Norman, H. P. Organ, S. Pendlebury, M. A. Rashid, E. H. Vick, E. J. Wilcock, S. L. Wong. *Candidates Transferred*:—*Associate Member to Member*:—A. M. Coombs. *Student to Associate Member*:—J. C. Connan, S. M. Hills, O. Howarth, G. W. P. Page, T. F. Phillips, J. C. Rennie, B. Snowball. *Student to Graduate*:—E. G. Grant, P. G. Spary.

## THE RATEABLE VALUE RESIDENCE TARIFF

**D**URING the discussion on Mr. A. H. Seabrook's address to the "Point Fives" on January 16th, at "Tricity" House (ELECTRICAL ENGINEERING, January 22nd, p. 46), it was contended that the "connected load" basis for assessing the primary charge was the most satisfactory for premises other than residences. The author agreed. It was also suggested that the author advocated the principle of "get as much as you can from consumers." In reply to an objection that 6d. per unit for lighting was not a competitive price with gas at 2s. 6d. per 1,000 cub. ft., Mr. Seabrook said that he had in his area hundreds of large and small consumers paying 6d. per unit on the alternative flat rates, and that it was quite possible to get even 8d. However, in spite of that, during the past year or so no consumer was charged more than an average of 6d., whatever his rate worked out at on either the telephone system or the Wright maximum demand system. In reply to a further question as to why he now advocated the rateable value system of charging, he said that on this system any contractor or any consumer could calculate out for himself in half a minute what his annual charge was going to be. This simplicity would help business-getting. On the "connected load" basis each consumer had to be separately quoted by the supply undertaking, causing delay and complication. Another point was, the "connected load" basis necessitated inspections, and inspections were both irritating to the consumer and expensive to the undertaking. A third point was that the rateable value basis would maintain the lighting income, even if lamps were very much improved in efficiency. One speaker advocated the hiring out of cookers at very low rates, or even supplying them free to the consumer, and charging a higher rate for the current. The author pointed out that this was good from the manufacturers' view, but was quite unfair to the consumer who bought his apparatus. Another speaker mentioned that considerable all-night heating loads in residences had actually come about owing to a reasonable competitive rate being charged, and Mr. Seabrook said that an all-night heating load of about 200 kw. had come under his observation during this winter.

The next meeting will be held on Friday, April 17th, under the chairmanship of Mr. J. W. Hame, of York.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,376.

In high-tension A.C. motors, trouble is often encountered through the insulation breaking down on the coils nearest the terminals, due to the high initial voltage on switching in. Describe fully arrangements which are used, and have been found satisfactory in practice, whereby this trouble can be overcome. "G. T."

(Replies must be received not later than first post, Thursday, February 5th.)

### ANSWERS TO No. 1,374.

When an induction motor develops a loose connection in the rotor, the ammeter will be caused to set up a periodic swing. It is desired to know the relationship which exists between this swing, the frequency, and the number of poles. Explain fully what causes the swing.—"DUD."

The first award (10s.) is made to "MARF," who writes as under:—

The swinging of the ammeter needle is caused by an increased current which is continually altering in phase,

relative to the main current in the stator coils. This alteration in phase occurs as explained below, and is due to the "slip" between the rotor and the rotating field induced by the stator coils. Referring to the accompanying sketch. Assume that at any time the loose conductor on the rotor is in position 1. The mutual induction between the stator coil A and the rotor will be reduced. Consequently more current will be indicated on the ammeter.

A period later the conductor will have moved round into the position 2 (slightly behind its former position owing to "slip"). After another period it will be in position 3, and so on, until ultimately it will be in its original position (1) at the commencement of a period. The above process then recurs. The current variation observed on the meter is now easily explained. When the "extra current" is in phase with the main stator current the needle reaches the top limit of its swing. When the phase difference is 90°, the needle is in its mid-position, and when the difference reaches 180° the needle is indicating the lowest value. From this it can be seen that the "swing period" of the needle will be the time taken for the rotor to "slip" one revolution relatively to the revolving field; or in the case of a six-pole three-phase machine, one-half revolution. If  $p$  = supply frequency,  $n$  = number of poles, and  $k$  = percentage "slip" of rotor, we get—Time for one swing of ammeter needle =  $1/p \{ p \times p(100-k)/100 \} \times 3/n$  secs. for three-phase motor; or  $1/p \{ p \times p(100-k)/100 \} \times 2/n$  secs. for two-phase motor. Thus the time of swing is proportional to the frequency and inversely proportional to the number of poles.

The second award (5s.) is made to "A. G. R.," who includes in his reply the following:—

If a polyphase induction motor with wound rotor and slip rings is running with one or more of its secondary circuits open so that but a single circuit in the rotor is closed, it will be found that the motor will operate at approximately one-half speed and develop considerable torque. With increase in torque the speed will fall off as in the case of the polyphase motor running at full speed. This action may be explained by resolving a single-phase field into two oppositely rotating fields. When the rotor or secondary, with but a single circuit closed, is rotated at half-speed, the current induced in it is at half the frequency of the primary current. This single-phase current sets up a single-phase field, of half the primary frequency, which can be resolved into two rotating fields moving in opposite directions. As the rotor is travelling at half the speed of the primary or stator rotating field, and as the frequency of the secondary circuit is half that of the primary, it is evident that one of the resolved secondary fields has a resultant speed equal to that of the primary field, and in the same direction. The other secondary resolved field has a resultant speed which is zero, i.e., it is stationary with respect to the primary or stator windings, and can have no effect on them. This should, therefore, be a position of zero torque, and the motor should have no tendency to rise above it. If the motor is now loaded it will tend to fall off in speed, and will develop considerable torque up to some maximum, and if loaded beyond this value of torque the speed will fall off. This motor runs at half speed or lower, practically in the same way as the ordinary polyphase motor runs at full speed and below. At exactly half speed one of the fields, as stated before, is at a standstill with respect to the stator windings. As the motor slows down under load this field will be moving with respect to the stator windings, and will evidently generate E.M.F.'s in them which will increase in value as the motor slows down, due to increasing load. The interaction of this field upon the primary circuits may give rise to some very complex conditions, such as increased currents (which are sometimes very heavy) in the primary circuits, a periodic swing of current, &c., and the motor will operate at a very poor power factor.

## ANSWERS TO CORRESPONDENTS

**PHASE.**—Mr. C. G. Morley New writes:—A. G. R., in his answer to Question 1,373, has confused the Board of Trade Regulations regarding earthed conductors with the earthing of the lead sheathing. The fact that it is proposed to use the lead sheathing as a conductor would of course bring it under the regulations referred to.

**DISPUTANT.**—The correct spelling is Leclanché, and the pronunciation something like Leklanshey, with the accent on the second syllable. Leclanché was a Frenchman.

**CHOKER.**—A 25/20-volt auto-transformer, which is similar in principle to a choking coil, will meet your requirements.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

An interesting Address was given on January 21st by Mr. A. A. Campbell Swinton to the Wireless Society of London. Mr. Campbell Swinton is the first President of the Society, and the meeting was the first since the constitution, aims and objects of the Society were definitely decided upon. It was held in the Lecture Theatre of the Institution of Electrical Engineers, and this was filled to its utmost capacity. An aerial was erected on the roof, and arrangements were made to receive a message from the Eiffel Tower. This was received on a syphon recorder, and the movements of the pen marking the strip were clearly shown on the screen by the use of a Lietz Universal Projector. At the time that the message was coming through an Admiralty message was also tapped. For working the syphon recorder three of the relays designed by Mr. S. G. Brown were used. One of the "A" type instruments was connected to the oscillation transformer. This fed a telephone "G" type relay, to which a telephone was connected, and lastly this was coupled to a "W" type relay. This relay is so adjusted in use that the contact is broken by the very small quick movements of its rocker. The movements are too quick for the syphon recorder to follow, but the duration of each group, however, is recorded. Among the other detectors may be mentioned the sensitive manometric flame, which is influenced by feeble sounds from the receiving telephone, or the gas issuing from a very fine jet may be passed through a piece of wire gauze and lighted. This flame is more rapid in action and therefore more dead-beat. The most sensitive spot for the telephone is at the mouth of the orifice from which the jet issues. These instruments may be tuned to discriminate between sounds of different acoustic pitch. Besides the Brown relays, the Hurltley relay may be used. In this a moving coil moves a very fine straight wire of considerable resistance, which is slightly heated by passing a current through it, in and out of a blast of cold air proceeding out of a narrow slot. The alterations in resistance due to the temperature changes are sufficient to work a telegraphic instrument. In the Orling relay a suspended coil has a finger which just touches on one side of a minute jet of acidulated water. When the coil moves the jet is moved to a much greater extent, and is arranged to bridge or leave open the space between two contacts in a local circuit. It was announced during the Address that Sir William Crookes and Sir Oliver Lodge had consented to become Honorary Members of the Society.

It is remarkable how long the hand-replacement "drop" indicator has survived, in spite of the numerous improvements in telephone switchboards during the past twenty

years. When central battery switchboards with lamp visuals were introduced, a great point was rightly made of the fact that the calling indicator and answering jack were brought together so that one thought and one action only was needed on the part of the operator. For small magneto boards, in which it was not expedient to have lamp visuals, a combined jack and indicator immediately suggested itself, and about nine or ten years ago, we believe, Messrs Ericsson designed one. It was not extensively adopted, however, at any rate not in this country, and it is interesting to see that the idea has been revived by the Peel Conner Telephone Works, who are supplying magneto switchboards for from twenty to 150 lines, with combined jacks and indicators. The boards also have clearing indicators which are mechanically replaced by the operation of the listening key.

We have received from Siemens Bros. & Co., Ltd., a copy of their revised pamphlet dealing with quenched spark wireless installations for ships. The pamphlet was first issued in May last, and was reviewed in *ELECTRICAL ENGINEERING*, June 5th, 1913, p. 325, Vol. IX. The following shipping companies are amongst those who have adopted this system:—The Federal Steam Navigation Co.; Alfred Holt & Co.; the Indra Line; the General Steam Navigation Co.; the Australind Steam Shipping Co.; P. Henderson & Co.; and the Dover Harbour Board. There are now, we are informed, over ninety British vessels so fitted. It is not necessary to provide a specially made sound-insulated cabinet to contain the spark gap, as the working is practically noiseless. The energy radiated by the aerial is in the form of practically an undamped wave, and as the note is musical, it can be heard over natural electric discharges or "atmospherics," even when these are as much as ten to fifteen times as intense as the incoming signals. The larger stations are supplied in two types, called the "tropical" and "standard" forms. The essential difference between them is that in the tropical type a Leyden jar form of condenser is used, whilst in the standard type an oil condenser is used. Both installations have the same range, but the former is built mainly of metal, so that it does not suffer so much by constant exposure in a tropical climate. The smallest station dealt with is intended for use on launches, and requires only 300 watts, and has a range from eighteen up to thirty miles. The dimensions of the set are 1 ft. 8 in. by 2 ft. 6 in. All the apparatus is mounted upon a board. The largest station which is described has a guaranteed range of up to 550 miles, which is, however, considerably larger than the stations usually installed in mercantile vessels, although the *Imperator* is fitted with a 7.5-kw. quenched spark installation. We understand that the Company have in hand at Woolwich the construction of three naval stations having a guaranteed range from 800 to 2,000 miles. The pamphlet is profusely illustrated, and contains also a large amount of purely descriptive matter. All those interested in wireless telegraphy should apply for a copy.

An interim dividend of 10 per cent. on the ordinary shares is announced by Marconi's Wireless Telegraph Co.

An article by Mr. Charles Bright in the January number of the *Quarterly Review* discusses the question of inter-imperial telegraphy and the advantages and disadvantages of cable telegraphy as opposed to wireless telegraphy. Whilst in favour of the State taking over control of the Imperial Telegraph Wireless Scheme, Mr. Bright thinks that an inter-imperial telegraph system would be the more advantageous. The route suggested is from Blacksod Bay, on the West Coast of Ireland, to Halifax (N.S.), with an intermediate station at Cape Bauld (Newfoundland), and a branch cable up the Gulf of St. Lawrence towards Montreal. The cost of this line is estimated to be £500,000, and should be borne by the Empire as a whole. Having laid the Imperial Atlantic Cable, it is suggested that the gaps should be filled up in order to complete an all-British cable chain between the mother country and her outlying possessions. Attention is drawn to the fact that all the existing Atlantic cables are in foreign hands, and it is recommended that steps should be taken to remedy this state of affairs, which, it is argued, would be extremely prejudicial to the British nation in the event of international disputes.

Communication between Bailundo and Bihé in Angola was down on the 20th inst. and restored on the 21st inst.—The Curcavellos St. Michael and Fayal St. Michael cables are broken, and although telegrams up to the 22nd inst. were sent by mail opportunities, since that date messages are being sent via the Porthcurno-Fayal cable without change of rates.—The Oran-Tangier and Tangier-Cadiz cables failed on the 21st inst., and the Fao route was down on the 23rd between Alep and Bagdad, and Moussoul and Bagdad, and was repaired on the 24th inst.

### REVIEWS OF BOOKS

**Insulation and Design of Electrical Windings.** By A. P. M. Fleming and R. Johnson. 224 pp., 9 in. by 5½ in. 102 figures. (London: Longmans, Green & Co.) 7s. 6d. net; abroad, 8s. 1d.

We heartily recommend this most excellent book to our readers. While much of the experimental and research work it contains has already been published by the authors in another form, there is a great deal of new matter, and a text-book has been produced of a most comprehensive, thorough, and practical character. The volume affords most interesting reading throughout, and will appeal equally to the operating engineer and to the designer and manufacturer. After an introduction to the physical characteristics of dielectrics in general, the authors discuss the values of the actual electrostatic stresses to which different kinds of windings may be subjected during operation, both normal and abnormal. This is followed by a thorough chapter on insulating materials, containing some useful notes on transformer oils. The design of windings is then discussed with special reference to insulation problems. The chapter on insulation tests is obviously the fruit of considerable experience on the part of the authors, who rightly call attention to the uselessness of the insulation resistance tests sometimes specified. The prolonged drying-out given to a machine in order

to reach a high insulation resistance may do more harm than good. The authors also depreciate extra-high pressure tests on account of the excessive strain on the dielectric, and of the possibility of the breakdown in composite insulation of the layers of materials of lower specific inductive capacity, due to a non-uniform potential gradient. Their fear of danger of chemical action during these short high-pressure tests is surely unfounded, however. A useful chapter on the drying and handling of windings follows, and in conclusion the authors add a few notes on insulation failures of a highly practical and valuable nature. One warning against welded laminations at points of breakdown in slots (producing overheating by eddy-currents and burning of the new coils) would have saved a second breakdown in the case of a 5,000 kw. alternator within the reviewer's own knowledge recently, had it been kept in mind.

**Transmission Line Formulas for Electrical Engineers and Engineering Students.** By H. B. Dwight. 137 pp. 8 in. by 5½ in. 27 figures. 17 tables. (London: Constable & Co., Ltd.) 8s. 6d. net; abroad, 8s. 10d.

One striking feature of electrical work is the accuracy with which results can be predetermined, and this handy little book on transmission line calculations is an excellent example. The effects of inductance, capacity and resistance on the line drop and regulation are here reduced to a few simple formulæ, the derivation of which can be easily followed. For transmission lines up to 100 miles in length with a regulation of less than 10 per cent., the author provides a chart from which the regulation under different conditions of load and power-factor can be read off almost directly, and with an accuracy within 0.5 per cent. of the line pressure. Very simple formulæ neglecting the inappreciable capacity effects are given for lines up to twenty miles in length. A second series of formulæ include the effects of capacity, but neglect the leakage and corona loss. For very high voltage lines, for which this last effect must be taken into account, a third set of formulæ must be used. A large number of examples are worked out, one of the most interesting being the predetermination of the power factor which would be necessary at the receiving end of a 110,000-volt transmission line to cause the pressure at that end to be the same as the pressure at the generator end. The more difficult and complex hyperbolic formulæ are given, but the author also presents an easier method of obtaining the same degree of accuracy as is reached with hyperbolic formulæ, consisting of the use of formulæ expressed as converging series. Any desired degree of accuracy can be obtained with these series. There are some useful chapters on the reactance of single wires and stranded cables, and on the skin effect, and finally a number of tables giving the values of reactance, &c., used in the formulæ. It is unfortunate that these values are scheduled for B. and S. gauge wire, and for area in circular mils. only. The diameter in inches is given, but the addition of the area in square inches would have made reference easier for British readers.

**Alternating Currents and Alternating Current Machinery.** By D. C. Jackson and J. P. Jackson. 968 pp. 9 in. by 5½ in. 526 figures. (New York: The Macmillan Co.; London: Macmillan & Co., Ltd.) New edition. 23s. net; abroad, 24s. 1d.

The first edition of this work appeared in 1896, at a time when text-books on alternating currents were not plentiful, and at once took a high place in the literature of the subject. Naturally, the enormous developments in the study and in the use of alternating currents have necessitated almost its entire re-writing, and this has been done by the authors without losing any of the clearness of their earlier work. The mathematics—and the book is one in which mathematical treatment forms a large but by no means exclusive part—is carried further than was possible before, especially in respect to vectors, complex quantities, and Fourier's series. The authors, however, use mathematics only as a means to their

end, and do not let it interfere with a true physical conception of the phenomena. There is now also more complete treatment of hysteresis and eddy current losses in iron cores, and both synchronous and asynchronous motors and generators are dealt with more fully, as well as calculations relating to transmission lines. The book is intended as a students' text-book, such as is required in the more extended college courses, and although dealing mainly with the theoretical side of the subject, contains a great deal that is practical in the best sense of the word, and although not teaching actual machine design, contains just those things that must be understood by the designer. The illustrations are above the average in such works, and in every way the new edition lives up to the high reputation established by the first. It should be added that there is nothing due to its American origin that makes it unsuitable for use in this country.

**Telephone Cables.** A Handbook of the Design, Construction and Maintenance of the Telephone Cable Plant. By J. C. SLIPPY. 147 pp. 7 in. by 4½ in. 97 figures. (Pittsburg: J. C. Slippy.) 10s. 6d. net.

This small volume does not deal with the manufacture of cables at all, but constitutes a useful epitome of American practice with regard to the specification and lay-out of the cable part of the telephone network. Overhead work receives the best treatment, and the greater part of the book is allotted to this subject. Telephone engineers and linesmen will find in it much that is of practical use to them.

**Electric Lighting Accounts.** By G. JOHNSON. 171 pp. 8½ in. by 5½ in. (London: Gee & Co., Ltd.) Second edition. 7s. 6d. net; abroad, 7s. 11d. (Accountants' Library, Vol. XXIX.)

An elaborate system of book-keeping, suitable for a large electricity supply company, is set forth in detail, and such matters as the purchase, storage, and record of stores and materials, and the statements prepared for the monthly meetings of directors are included. We are unable to say whether the system described is in use in its entirety by any particular company, but in any case there is much in the volume that may give useful suggestions to those managing electricity supply undertakings. The value of the book would have been enhanced if indications were given as to the means by which the system could be best simplified for smaller concerns, for simplification in some respects would be desirable. At the commencement of the book the accountant has explained to him the methods of charging, and is given copious examples. The reason for and application of the maximum demand system, and the standing charge plus price per unit methods, are explained, but the "rateable value" method is not reviewed. In this section the author has chosen a rather unfortunate example with which to illustrate the maximum demand system; with the particular standing charges and running costs which he has taken, and his prices of 8d. and 2d. per unit, the profit per unit on the short-hour consumer works out to more than on the long-hour consumer for the same number of units, although in his comment the author points out that the small consumer who makes a steady demand over a longer period daily is a more profitable customer to the lighting company, though his total consumption for the same period is much less. "Diversity factor" is somewhat unnecessarily dragged in on a later page, as the author does not explain how it may affect the construction of the light and power tariff, and, moreover, the definition of it quoted is a hundred times the reciprocal of that generally accepted. Taking into account the large number of specimen rulings, the price of the book is very moderate.

**Electricity in the Service of Man. Vol. II. Section 1. Technology of Electricity.** By R. M. Walmesley. 686 pp. 9½ in. by 6½ in. 691 figures. 11 plates. (London: Cassell & Co., Ltd.) 7s. 6d. net; abroad, 8s. 6d.

It is a little difficult to appreciate exactly for what class of readers this book is really intended. On the one hand the treatment is too complex to enable it to be designated "popular," and yet it is neither elementary nor advanced, though it gives a good general idea of the construction of machines, their accessories and generating stations. There are large numbers of sketches, scale drawings, and photographs of both complete machines and details, which for certain purposes render it useful for students. Vol. I., which appeared in 1910, dealt with the "History and Principles of Electrical Science," and Vol. II. deals with the "Technology of Electricity." The part of Vol. II. which has just

By **JAMES ERSKINE-MURRAY,**  
D.Sc., F.R.S.E., M.I.E.E.

**ELECTRIC WIREMEN'S WORK.** A Text Book in three Sections, suitable for Installation Inspectors, Electricians, Wiremen, Students, and others engaged in the Electrical Trades. By J. H. HAVELOCK, A.M.I.E.E. Fully Illustrated, with numerous Tables. [Nearly ready.]

**WIRELESS TELEGRAPHY: Its Theory and Practice.** A Handbook for the use of Electrical Engineers, Students and Operators. By J. ERSKINE-MURRAY, D.Sc. Fourth Edition. 10s. 6d. net.

**THREE - PHASE TRANSMISSION.** A Practical Treatise on the Economic Conditions governing the Transmission of Electrical Energy by Underground and Overhead Electrical Wires. By Wm. BREW, M.I.E.E. Second Edition, Revised and Enlarged. 185 pages, 82 Illustrations. Demy 8vo, cloth. 7s. 6d. net. [Just Published.]

**ELECTRICAL ENGINEERING.** A First Year's Course for Students. By TYSON SEWELL, A.M.I.E.E. Fifth Edition, revised, with Additions. Large Crown 8vo, cloth. 460 pages, with 278 Illustrations. 5s. net.

**ELECTRIC TRACTION AND TRANSMISSION ENGINEERING.** By SAMUEL SHELDON and ERICH HAUSMANN. 317 pages. 127 Illustrations. Large crown 8vo, cloth. 12s. net.

**ELECTRIC WIRING, DIAGRAMS & SWITCH-BOARDS.** By NEWTON HARRISON. Crown 8vo, cloth. 5s. net.

**ELEMENTARY ELECTRICAL ENGINEERING.** In Theory and Practice. A Class Book for Junior and Senior Students and Working Electricians. By J. H. ALEXANDER. 220 pages. 181 Illustrations. Crown 8vo, cloth. 3s. 6d.

**WIRELESS TELEPHONES: and How they Work.** By J. ERSKINE-MURRAY. Second Edition. 1s. 6d. net.

**DYNAMO MOTOR, AND SWITCHBOARD CIRCUITS FOR ELECTRICAL ENGINEERS.** A Practical Book dealing with the subject of Direct Alternating, and Polyphase Currents. By WILLIAM R. BOWKER. Second Edition, revised. Medium 8vo, cloth. 109 Diagrams. 7s. 6d. net.

**STANDARD ELECTRICAL DICTIONARY.** By T. O'CONNOR SLOANE. 7s. 6d. net.

**ALTERNATING AND DIRECT CURRENT DYNAMOS.** A Text-Book on their Construction for Students, Engineer Constructors and Electricians-in-Charge. By TYSON SEWELL, A.M.I.E.E. 328 pages. 230 Illustrations. Large Crown 8vo, cloth. 7s. 6d. net.

**WIRELESS TELEPHONY: in Theory and Practice.** By ERNST RUHMER. Translated from the German by J. ERSKINE-MURRAY. Demy 8vo, cloth. 10s. 6d. net.

Complete Catalogue post free on application.

London: Crosby Lockwood & Son  
7, Stationers' Hall Court, E.C., & 5, Broadway, Westminster, S.W.

appeared is designated, "The Generation, Transmission, and Utilisation of Electrical Power"; however, only continuous and alternating-current generators, generating stations, and continuous-current motors are dealt with. Presumably the remainder of the subject, including transmission, alternating-current motors, traction, electro-chemistry, and electro-metallurgy are to be dealt with in the second part. Telephony, telegraphy, and signalling generally are also to be dealt with later. So far as Vol. II., Part I., is concerned, it deals with the subjects treated of at length, and especially near the beginning reference is continually made retrospectively to Vol. I., or further forward in its own pages. Although the bulk of the space is devoted to machinery, yet switchgear, voltage regulators, synchroscopes, &c., are ably treated and form one of the most interesting parts of the book. The chapter on generating stations, deals with steam, gas, oil, and water-driven stations, and numerous examples of new and old plant are given. It is to be regretted that each part does not have its own index.

**Formulae and Tables for the Calculation of Alternating-Current Problems.** By L. COHEN. 282 pp. 9½ in. by 6½ in. 68 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 12s. 6d. net.

There are many electrical engineers who have often wished for a handy collection of the most useful mathematical formulae necessary to solve A.C. problems. In this book there is such a collection of formulae with their derivations, suitable explanations and examples of use. The problems dealt with include those involving resistance and eddy current losses in metallic conductors, inductance, capacity, and many of the combinations of these found in practice and constituting an A.C. circuit. Besides the formulae relating to the conditions prevailing when a steady state is reached, transient phenomena are also dealt with. This treatment, of course, involves the use of the higher mathematics, including hyperbolic functions. The book is made complete by the inclusion of a valuable chapter on mathematical formulae, and it will prove a desirable addition to the libraries of those who have to do with power, telephony and telegraphy over wires and through the ether, as well as of those who are studying the general subject of alternating currents.

**Transformer Practice.** By W. T. TAYLOR. 278 pp. 9½ in. by 6½ in. 191 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 2nd edition, 10s. 6d. net.

There is included in this book a considerable amount of useful information concerning the connection, installation, and working of transformers, but the author has, in his endeavour, no doubt, to make it as complete as possible, included examples of transformer connections, rarely, if ever, met with in practice. If an engineer in charge of transforming plant was not prepared to carry out emergency connections in cases of possible trouble, some considerable time would probably elapse before a parallel case was found described in this work. On the other hand, the style of the section dealing with transformer connections renders it more suitable for reference than for continuous reading. The author indulges in some peculiar calculations at times, though correct results are obtained. There are indications, too, that the proofs have been passed in a rather hurried way. There is an interesting discussion on the cheapest and best way of connecting three-phase systems, both earthed and unearthed. The chapters on transformer cooling and transformer construction are instructive, as are also those devoted to constant current and series transformers, and variable ratio transformers. Protection and testing are also well treated. It must also be said that, in general, the diagrams are arranged so as to be self-explanatory, and to convey rapidly to the mind what the author intends them to.

**Village Electrical Installations.** By W. T. WARDLE. 80 pp. 7½ in. by 5 in. 12 figures. (London: Whittaker & Co.) 2s. net; by post, 2s. 2d.

This is a subject upon which little specific has been written, and yet one which has certainly deserved a book to itself; and the author has supplied it. He clearly indicates which applications of present-day practice are most applicable to village lighting, and gives examples and illustrations of actual plants already serving this purpose in Great Britain. There is no doubt that a large field exists for an extension of electric lighting in small places outside the range of power companies' operations. While there have been for years hundreds of villages on the Continent and in the United States provided with electric light, there are com-

paratively few in this country. The small Continental installations are mostly run by water power, which, as is popularly but erroneously supposed, "costs nothing." But if a comparison were made of the capital cost of some of the earlier of these stations, erected in the 4-watts-per-candle days, and the cost of a steam, gas, or oil station of one-third the capacity—for supplying the same number of tungsten lamps—it would be found that the saving in the interest and reasonable depreciation and sinking fund charges would be far greater than the fuel costs.

#### Handbook of Technical Instruction for Wireless Telegraphists.

By J. C. Hawkhead. 295 pp. 8½ in. by 5½ in. 170 figures. (London: Marconi Press Agency, Ltd.) 3s. 6d.; abroad, 8s. 11d.

It is even more important that wireless telegraphists on sea-going vessels should have a clear understanding of the apparatus under their control than it is for wireless telegraphists in land stations, though obviously it is desirable that all persons in charge of apparatus should understand its working. It is often the case, however, that wireless operators accustomed to land working do not know sufficient to enable them to take up marine wireless without additional training. This handbook is calculated to appeal to this large and rapidly growing class, as well as to amateurs, as the information contained is of a reliable nature, and is imparted in an interesting manner by one who writes from practical experience. There are three parts to the book. The first deals with the fundamental properties of electricity and electric circuits; the second deals with electro-magnetic waves and receiving circuits; and the third deals with aërials, and complete ships' and portable sets, while some space is devoted to faults and testing, and general useful hints for keeping the equipment in good condition. Analogies are resorted to, but are not pressed too far, while there are numerous diagrams and photographs. Nothing of importance for those to whom the book is addressed has been omitted from the text, so that anyone who goes through it carefully should be qualified to sit for the Post Office examination for wireless telegraphists.

**Automatic Telephony.** By S. Turner. 32 pp. 7½ in. by 4½ in. 13 figures. (London: S. Rentell & Co., Ltd.) 6d. net; by post, 7d.

This cheap book on the subject, written by a member of the Engineer-in-Chief's staff at the Post Office, will doubtless be popular, but its utility is to some extent impaired by the bad printing of two of the most important illustrations. A not unusual printers' error of "multiplied," instead of multiplied, has escaped the author's attention when reading the proofs.

**Jahrbuch der Elektrotechnik für 1912.** By K. Strecker. 223 pp. 9½ in. by 6½ in. 16 figures. (Munich: R. Oldenbourg.) 8s. net; by post, 8s. 8d.

This book, which it is proposed to publish annually every spring, is taking the place of the *Fortschritte der Elektrotechnik*. The latter has appeared regularly for many years, and presented, in a classified form, references to all the papers, articles, patents, &c., which had appeared in the Press and Institution proceedings in Europe and America during the previous year. This was by no means as useful as, though perhaps more comprehensive than, our own *Science Abstracts*, and the present volume is less useful still, as the references are bare volume and page references, and the reading-matter a curt summary of progress without details. The former and more useful arrangement was given up owing to the high cost of production.

**Electric Lighting: A Practical Guide to the Wiring of Houses and the Installing of Electric Light Plants.** By A. H. Avery. 150 pp. 7½ in. by 5 in. 65 figures. (London: Cassell & Co., Ltd.) 2s. net; by post, 2s. 3d.

Amateurs must be supplied with books. Electricity has a fascination for the amateur, and he will not stop at bell-wiring and the making of model dynamos and motors, but is bound sooner or later to try his hand at electric lighting. He must derive his knowledge largely from newspapers and books dedicated to his class, and there are many to supply his needs. Unfortunately, the large majority of these are written by men who are themselves amateurs, and in consequence mistakes in them are not uncommon, and the directions given are not always in conformity with the best practice. Assuming, therefore, as we must, that the amateur will have his books, it is preferable that they should be written, as is this one, by an electrical engineer. The author has a clear grasp of the class of matter which the amateur requires, and there is little in his book to which exception can be taken.

## MODERN ENGINES AND POWER GENERATORS.

By Rankin Kennedy, C.E.

The Coupon below entitles any reader to a complimentary copy of an illustrated booklet, describing what is probably the most valuable work upon this subject ever published.

The importance of the subject is growing day by day, and "The Book of Modern Engines and Power Generators" can easily prove of the greatest value to those who desire to be fully informed upon the latest developments in every branch of the subject.

The author, Mr. Rankin Kennedy, C.E., is well known as an authority on his subject, and in this work he explains in the clearest and most thorough manner the design and construction of prime movers; the term is here used in its widest sense, as it applies to all engines, whether worked by petrol, oil, steam, air, gas, water, or electricity, and as it includes all machinery and processes connected with power generators and distribution.

### ENTIRELY UP TO DATE.

Moreover, all these subjects have been brought entirely up to date. The previous Edition of the work achieved such an immediate success, that for the new and Revised Edition, the scope of the work has been widened and extended so as to cover every branch of the subject, by the addition of a great amount of new matter, and many new illustrations of very great interest and high value.

This new Edition is indeed already recognised as the standard work on its many varied subjects, including Rotary Engines, Gas Turbines, Gas Engines, Oil Engines, Petrol Engines, Suction and Producer Gas Engines, Blast Furnace Gas Engines, Marine Engines of every design and type, Compressed Air Motors, Air Compressors, Refrigerating Engines, Windmills, with electric storage, Fluid Hydraulic Engines, Water Pressure Engines, Hydraulic Rams, Water Pressure Turbines, and Water Raising Engines, Centrifugal Pumps and Air Lifts, Power Distribution and Transmission by Gearing, Water Pressure, Compressed Air and Electricity, etc., etc.

### OVER 2,000 ILLUSTRATIONS.

The work is profusely illustrated by diagrams, text-cuts, and plates. In all there are over 2,000, every one of great practical utility to the engineer.

Enough has been said to show that this work is indispensable to all electrical, mechanical, steam, and hydraulic engineers, and to all who are concerned with manufacturing, designing, draughtsmanship, electro-chemical, and metallurgical work, with automobiles, tramways and railways, boilers, shipbuilding, collieries and mines, etc.

We would advise those who are determined to keep abreast with all the latest specialist knowledge concerning every detail of their profession to send for the free booklet which is supplied by the publishers to those mentioning this paper.

## A FREE BOOKLET.

To the CAXTON PUBLISHING Co., LTD.,

97, Surrey Street, London, W.C.

Please send me, free of charge, a copy of the book describing the "Book of Modern Engines and Power Generators," and showing how it can be obtained for a first payment of 1s. 6d., the balance to be paid by small monthly payments.

NAME .....

ADDRESS .....  
.....

**Soft Soldering, Hard Soldering, and Brazing.** By J. F. Hobart. 190 pp. 7½ in. by 4½ in. 62 figures. (London: Constable & Co., Ltd.) 4s. net; abroad, 4s. 3d.

This book is wholly American in tone and expression. To the English reader it appears in parts very loosely written, and scrappy as to its matter, and is apparently largely composed of receipts for the various operations detailed, reprinted from some monthly journal (quoted in the text), to which they had been previously contributed. Its chemistry is hazy, and is in need of urgent revision. It is essentially a book for the amateur and the apprentice in the sheet metal trades. These could certainly read it with profit, whilst those of more mature experience may gain a few hints from its contents. In a simple way it describes the why and wherefore of many of the known processes of soft and hard soldering, and thus conveys some useful information to the beginner.

**Elementary Graphic Statics.** By J. T. Wight. 227 pp. 7½ in. by 5 in. 135 figures. (London: Whittaker & Co.) 4s. net; abroad 4s. 4d.

THE author's endeavour has been to present a book suitable for students in search of a working knowledge of the application of graphical methods to the solution of the simpler problems met with in the practice of engineering and its ally, building construction. The use of graphical methods of solving certain problems is one which is appreciated by a far larger number of engineers than is the equivalent analytical methods, and is, in fact, largely used in practice. The book under review opens with the definition and specification of a force, and its graphic representation, and leads up to the design of roofs, braced beams, retaining walls, &c., and shows how to take into account different kinds of known and unknown loads. It is of useful size, and the matter is well put together and illustrated.

**The Inventor's Adviser and Manufacturer's Handbook to Patents, Designs, and Trade Marks.** By R. Haddan. 468 pp. 8½ in. by 5½ in. (London: Harrison and Sons.) Ninth edition. 5s.; abroad, 5s. 5d.

This is a real "Adviser" upon all matters pertaining to patents, designs, and trade marks. Not only does it give a useful and complete summary of the patent laws of all countries, but a most helpful discussion is given of the nature and policy of patents, and the pitfalls to be avoided when taking out patents, &c. By the aid of this handbook, nobody need be at a loss to understand how to go to work to protect an invention, nor be in doubt as to the nature of such protection when it is obtained. The many new questions of patent law involved by the passing of the Patent Act of 1907 are dealt with, and the authorities are quoted for the various decisions referred to.

**Naval Warfare.** By J. R. Thursfield. With an Introduction by Rear-Admiral Sir C. L. Ottley. 151 pp. 6½ in. by 5 in. (Cambridge: The University Press.) 1s. net; by post, 1s. 2nd. (Cambridge Manual.)

We have in this volume another addition to the excellent series of "Cambridge Manuals of Science and Literature," which are useful to give the general reader a sense of proportion in subjects which are foreign to his specialised study. The author lays down the general principles of naval warfare, amply illustrates them from history, and without going much into technicalities clears one's ideas on the subject. He gives due credit to wireless telegraphy as assisting communication, but is inclined to think that the strengthening of supreme control which it brings may weaken the initiative of individual commanders. Otherwise there is little relating to the part, nowadays no inconsiderable one, played by electrical engineering in naval warfare.

**The Practical Electrician's Pocket Book for 1914.** Edited by H. T. Crewe. (London: S. Rentell & Co., Ltd.) Cloth, 1s.; by post, 1s. 3d. Rexine, 1s. 6d.; by post, 1s. 9d.

In making its sixteenth annual appearance, this handy little pocket book now reaches nearly 500 pages, and bears evidences of extensive revision by its editor, Mr. H. T. Crewe, and his associates, to keep pace with the rapid developments of electrical engineering. A new chapter has been added by Mr. R. J. Wallis Jones on electric welding, and the all-important subject of electric cooking has been placed in the able hands of Mr. F. S. Grogan, who is known all over the country in connection with the application of electricity to the culinary art. Other sections to which additions have been made include those dealing with automatically controlled country-house lighting plants, the use of which is rapidly extending, electro-plating, electric cranes and lifts and electric signs. The whole work is of a practical nature, and is illustrated with particulars of up-to-date commercial apparatus.

**The "Practical Engineer" Electrical Pocket-Book and Diary for 1914.** 584 pp. 5½ in. by 3½ in. 169 figures. (London: Technical Publishing Co., Ltd.) Cloth, 1s. net; by post 1s. 2½d. Peltine, 1s. 6d. net; by post 1s. 8½d.

The growing space required for purely electrical matters has

rendered it necessary in the revision of this pocket-book for the 1914 issue to relegate matters relating to steam to a companion pocket-book on mechanical engineering. The principal additions relate to rectifiers and electric valves, and the care of and the detection of faults in dynamos and motors. The section on Acts of Parliament and official rules and regulations has been extended, and a useful new feature is a short bibliography at the end of each section. Several other sections have been considerably revised.

**Spon's Architects' and Builders' Pocket Price Book, 1914.** Edited by C. Young and S. M. Brooks. 308 pp. 6½ in. by 3½ in. (London: E. & F. N. Spon, Ltd.) Forty-first edition. 2s. 6d. net; by post, 2s. 8d.

This well-known pocket book has been so thoroughly brought up-to-date for this year's edition that the diary pages which were included in former issues have had to be omitted to keep the dimensions of the volume within reasonable limits. A section is devoted to electrical installation work, from which approximate figures can readily be obtained for the cost of electrical lighting or bell installations. Both this and other sections have been revised and extended.

**Hazell's Annual for 1914.** Edited by T. A. Ingram. 592 pp., 7½ in. by 5 in. (London: Hazell, Watson, and Viney, Ltd.) 3s. 6d. net; abroad, 4s. 1d.

Hazell's Annual for 1914 has been brought thoroughly up to date in all the items of information that it contains, and forms a valuable complete and useful compendium of miscellaneous facts and statistics in an easily accessible form. About six pages are devoted to electrical matters, including a general sketch of the present state and recent developments of electricity supply, with notes on electric working, the Edison battery cable and wireless telegraphy, &c. There is one little omission that we must point out, and that is the name of the President of the Institution of Electrical Engineers in the list of scientific and literary institutions. Of the non-electrical contents the short account of the Balkan wars is a most interesting piece of contemporary history.

**Rugby Engineering Society.**—Volume X. of the Proceedings of the Rugby Engineering Society contains among its many interesting items a report of the meeting at which the Paper by Mr. J. P. Chittenden on "Large Turbo Units" was read and discussed, as well as the Papers on "High-speed Bearings," by Mr. John C. K. Balfry, and "Modern High-speed Gearing," by Mr. H. Hubert Thorne. The volume may be purchased from the Society for 10s. 6d.

**New Books.**—Crosby, Lockwood & Son (7 Stationers' Hall Court, E.C.) have just issued the fifth edition of Mr. Erskine-Murray's well-known book, "A Handbook of Wireless Telegraphy." This edition is revised throughout and considerably enlarged. The same publishers will be issuing next month a book by Mr. J. H. Havelock, entitled "Electric Wiremen's Work." This is a text-book in three sections written for installation inspectors, electricians, wiremen, students, and others engaged in the electrical trades.

**L'Annuaire de l'Electricité.**—The first issue of a useful annual volume of reference, published by our French contemporary *La Lumière Electrique*, has just made its appearance. The 440-page book commences with a section on the distribution of electrical energy for power and lighting in France, with full tables of particulars of all the undertakings in the country. A list of traction undertakings is also given, and another section gives particulars of electrical companies of various kinds, including those engaged in manufacturing, distribution, exploitation, and traction. Information is also given of various official bodies, institutions, and societies connected with electrical engineering in France, and further sections of the volume deal respectively with legal enactments relating to electricity promulgated in 1912-13, technical education, and periodical electrical literature. A final list of advertisers forms a useful directory of French electrical firms.

**Proceedings of the National Electric Light Association of America.**—The papers, reports, and discussions at the thirty-sixth convention of the National Electric Light Association last June in Chicago have been published in four volumes. The first of these deals with the proceedings of the general, executive, and public policy sessions, while more technical matters are reserved for the second volume, which includes reports of the special hydroelectric and transmission sessions, before which a number of interesting points connected with high-tension working were discussed, and the more general technical sessions, where the subjects discussed included meters, incandescent lamps and lighting standards of power, prime movers, transforming, converting, and protective plant, overhead line construction, switchboard instruments, arc lamps, and a number of other matters. The third volume, entitled "Commercial Sessions," contains *inter alia* a good deal about applications of electric power, and the last volume is devoted to matters connected with accounting. The volumes form a valuable compendium of current American practice and opinion, and reflect the work of an extremely vigorous association.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Jan. 22nd, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in *italics* indicate communicators of inventions from abroad.

22,036/12. **Alarms for Wireless Receiving Stations.** W. H. SHEPARD and A. E. McKECHNIE. The arrangement comprises a movable switch which is influenced by ordinary calls, as distinct from a special prearranged "dash" call. When the receiving circuit has been operative for a predetermined time, the switch opens or closes the alarm circuit. Eight figures.

24,563/12. **Spark Plug.** W. M. MORDEY. An A.C. or D.C. spark is splayed out or caused to move from its initial position by electro-magnetic action. The spark takes place between the poles of a magnet. The gap is not uniform, and the spark is started in the narrowest part. The metal of the plug may be used as part of the magnet. Three figures.

29,839/12. **"Villard" Vacuum Valves.** W. J. MELLERSH. JACKSON (*E. W. Caldwell, U.S.A.*). The cathode is arranged to cause sufficient concentration of the cathode stream under abnormal regulating conditions to introduce or generate gas in the tube and to restore it automatically to its normal condition. A large surface cathode, a small focussing member, and a loosely movable spherical mirror concentrate the heat of the cathode to effect the regulation. Three figures.

80/13. **Watertight Connection between Lamp and Holder.** S. W. MARTYN. A sleeve fits over the joint which the ordinary lamp-holder makes with the lamp cap, and a screw or spring-ring is used so that there is a pressure tending to force the holder from the cap. Rubber or leather washers are used for making the ends of the sleeve watertight. Two figures.

331/13. **Welding Aluminium.** G. GRÜCHTEL. Between the place of welding and the electrodes are interposed metallic layers, which are removed when the weld is complete or if rendered useless by burning. Eight figures.

6,891/13. **Starting Synchronous Motors.** E. ROSENBERG. A small self-starting synchronous starting motor is mounted on the same shaft as the main motor. The starting motor has defined poles. The rotor is mechanically displaced with regard to the main motor, so that the phase of this may be fixed with respect to the phase of the supply circuit. For starting a rotary converter, the starting motor has an exciting winding connected to the brushes of the rotary in order to control the polarity. Two figures.

7,059/13. **Metal Filament Lamps.** H. ZSCHOCKE. The ends of the sections of metal filaments which are so mounted are fixed in metal clips or are held in grooves on non-conducting supporting arms, so that if during manufacture the filament is broken the whole need not be discarded. Two figures.

8,675/13. **Insulators for High Pressure.** B.T.-H. Co. (*G.E. Co., U.S.A.*). Vacuum chambers are formed in the insulator, and are evacuated to such a degree that no discharge can pass across. Four figures.

18,819/13. **Trolley Omnibuses.** E. CROSS. For running on tramway systems the current collecting and steering gear comprises a pivoted spring-controlled socket connected to the stud axles of the steering wheel, a detachable arm, and a runner or shoe engaging both the groove and table, or flat portion of the rail. A retaining trigger for keeping the shoe off the ground is provided. Seven figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** SCHMIDT [Projector lamps] 5,199/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** LANCASHIRE DYNAMO & MOTOR Co., WOOD and McLEOD [Planing machine drive and control] 43/13; BROTHERTON [Holding insulated coils during installation work] 4,225/13.

**Dynamos:** CHURCHWARD [Combined with governors] 7,146/13.

**Electrochemistry:** GES. FÜR ELEKTRO-OSMOSE [Osmosis] 26,061/13.

**Heating and Cooking:** BASTIAN [Elements] 8,144/12; BLOXAM (*Bergmann A.-G.*) [Heating current of air] 11,874/13.

**Ignition:** DUFFY [Spark plugs] 1,281/13; MELLERSH-JACKSON (*Stringham & Elmendorf*) 6,176/13; LUCAS and TURNER [Automobile engine-starting and lighting] 13,980/13.

**Incandescent Lamps:** GLADITZ [Manufacture of tungsten] 27,859/12; STREMMIG [Production of filaments from viscose] 11,104/13; READ [Filaments] 13,695/13; [Lamps] 16,770/13.

**Instruments and Meters:** PAUL [Magnetometers] 465/13.

**Switchgear, Fuses and Fittings:** JOHNSON (*W. C. Heraeus Ges.*) [Starting switches for mercury vapour lamps, motors, &c.]

27,956/12; VON KRAMER and KAPP [Resonating relays] 444/13; TOWNSON [Earthing clip] 1,862/13; CLEMPSON and MURRELL [Contact-makers] 2,361/13; FULLER [Increasing effect of current variations] 3,539/13; JOHNSTONE and FERGUSON [Regulators for dynamos] 5,158/13; B. T.-H. Co. (*G. E. Co., U.S.A.*) [Switching in high frequency circuits] 7,151/13; ETCHells, CONGDON & MUIR and MUIR [Control gear for lifts] 10,514/13; TOWLER [Controlling gear for electro-hydraulic pumps] 16,807/13.

**Telephony and Telegraphy:** SCHANZENBACH and KNAPP [Extensible mast] 514/13; SIGNAL GES [Wireless transmission system for aeroplanes] 736/13; WITHERS (*Cox and Dicketts*) [Motors for telegraph transmitters] 790/13; [Automatic telegraph transmitters] 791/13; WESTERN ELEC. Co. (*Wohler*) [Automatic telephone exchange] 1,223/13; SIEMENS BROS. (*Siemens & Halske*) 17,124/13; SIEMENS & HALSKE [Semi-automatic telephone circuits] 24,459/13.

**Traction:** LLOYD and NEW TRANSPORT Co. [Distribution of parcels, bales, &c.] 484/13; SOC. ANON. WESTINGHOUSE [Railway signalling] 22,029/13; COOPER [Railway signalling and control] 22,829/13.

**Miscellaneous:** JENSEN (*Dodd*) [Torpedoes] 27,981/12; GRAHAM [Electro-magnetic sound reproducing diaphragms] 1,278/13; GARDNER [Gyroscopes] 2,120/13; FRASER [Lifts] 13,447/13; HARLÉ ET CIE [Submarine mines] 13,807/13; FAERBER [Safety lamps] 16,058/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Electrometallurgy and Electrochemistry:** McNITT [Sodium and other metals] 29,987/13.

**Heating and Cooking:** SIEMENS-SCHUCKERT [Cookers] 29,714/13.

**Ignition:** POGNON [Spark plugs] 28,267/13; BENDIX [Starters for internal combustion engines] 29,814/13;

**Storage Batteries:** SVENSKA AKKUMULATOR AKTIEBOLAGET JUNGNER, 30,082/13.

**Telegraphy:** WIDEGREN [Writing telegraphs. The line capacity effect is reduced by the use of pulsations obtained from a D.C. source, so that a duplex action is set up] 29,239/13, 29,240/13, 29,241/13 and 29,242/13.

**Traction:** PIEPER [D.C. electric-engines] 29,504/13; [Mixed drive] 29,825/13; SIEMENS-SCHUCKERT [Pulling-off trolley lines] 30,045/13.

**Miscellaneous:** KRÜGER [Detecting icebergs at sea] 11,540/13; BOSCH [Lamps fitted with reflectors] 25,497/13.

### Amendment to Specification

22,664/12. **Dynamic Braking of Motor-driven Reciprocating Machine Tools.** B. T.-H. Co. (*G. E. Co., U.S.A.*). As a result of the extended investigation under Section 8, a statutory reference to specification No. 16,806/12 has been inserted.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

1,863 and 1,864 of January 30th, 1900. **Winding Coils.** W. G. HEYS (*J. Scott, R. Varley and J. S. Anderson, U.S.A.*). A number of coils are wound simultaneously on a common core with a sheet of insulating material between each layer. When the winding is complete the insulation and the core are severed between the adjacent helices to form the individual coils.

2,222 of February 3rd, 1900. **Electrolytic Mercury Meters.** A. WRIGHT and REASON MFG. Co. The anode is higher than the cathode. The mercury deposited at the cathode passes over a ridge into a container. The enclosing vessel is of glass, open only at the top, which is provided with a stopper. The electrodes are contained in a completely sealed glass vessel, with pockets to hold the anode mercury. The leading-in wires pass through this vessel.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, &c.:** E. GIRAUD [Earthing overhead lines in case of breakage] 21,945/06.

**Storage Batteries:** T. A. EDISON [Alkaline: one plate is of zinc, and magnesium is deposited on it during charging] 20,072/01.

**Switches, Fuses and Fittings:** SIEMENS BROS. (*Siemens & Halske*) [Sockets for fuse plugs] 22,107/02; J. C. ETCHells [Solenoid-operated rotary switches] 22,349/07.

**Telephony:** A. T. M. THOMSON [Allotting order wires for a definite time] 21,401/04.

**Traction:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [Protecting cables against induction from the rails of A.C. railways] 22,302/07; J. G. V. LANG [Series-parallel control] 20,969/08.

**Miscellaneous:** H. TIRMANN [Machine for connecting wires to casings of blasting fuses] 20,019/01.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 71. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**INDUCTION MOTORS.**—A new pamphlet dealing with open type and end hood pedestal type induction motors has just been published by Bruce Peebles & Co., Ltd. (Edinburgh). The pamphlet is divided into two parts. The first embraces open-type machines, and the second a very compact form of motor with self-contained bearings. This type is made in sizes up to about 1,000 kw., and is very suitable for direct coupling to fans, pumps, &c. The tables giving approximate weights, dimensions, rating, and other technical data are very complete. The names of some of the firm's larger customers, and names and addresses of its foreign and colonial agents, is given.

**MAGNETO TELEPHONE SWITCHBOARDS.**—The Peel Conner Telephone Works, Ltd. (Peel Works, Adelphi, Salford), have issued a new Bulletin relating to magneto cell switchboards and accessories. Reference to one of the features of this is made in our Telephony and Telegraphy column. The range of switchboards in question are of the non-multiple type, suitable for small exchanges and private installations.

**RADIATORS.**—A booklet has been published by the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), dealing with "Ediswan" Quartzalite patent heaters and radiators. Reproductions of a number of photographs of domestic installations are given to show that it is not necessary always to put the radiator in the fireplace.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**INSTRUMENTS.**—The first five sections of what will form a complete descriptive catalogue of the many delicate instruments made by R. W. Paul (Newton Avenue Works, New Southgate, N.) are now available. The sections referred to embrace resistances and rheostats, unipivot instruments for D.C. or A.C., D.C. laboratory apparatus, A.C. measurements, and high-frequency measurements. The sections to come will deal with "ohmmeters for measuring insulation and conductivity" and "electrical pyrometers." Each instrument is fully described and its working explained. The price-list for each section is given as a coloured inset, and the first figure of the list number and page number are identical. The initial letter of the code word designates also the section in which the description can be found. Separate price-lists are being printed in foreign currencies. The complete catalogue will contain over 2,000 entries and about 800 illustrations and diagrams.

**POWER TRANSMISSION ACCESSORIES.**—A neat pocket catalogue has just been sent us by Harpers, Ltd. (Aberdeen), who intimate that they will be glad to send a copy on application to any address. The following accessories are among those dealt with:—Wheel gearing, belt pulleys, rope pulleys, steel shafting, and pedestals and fixings.

A conveniently arranged pocket-book and diary, 4½ in. by 3½ in., has been sent us by McClure and Whitfield ("Mersey", Dynamo Works, Adwood, Stockport). The London representatives of this firm are Hogan & Wardrop (2 Gresham Buildings, Basinghall Street, E.C.).

### CORRESPONDENCE

#### CABLE CASINGS.

*To the Editor of ELECTRICAL ENGINEERING.*

DEAR SIR,—On November 27th, 1913, a letter was kindly placed in your paper requesting readers to give us their opinion whether casings would be more satisfactory if the edges were thicker to take a screw with the centre fillet proportionately less than is usual at present.

We have had numerous replies, and the general opinion appears to be in favour of having the three fillets of equal thickness, so that the capping can be screwed on the two edges of the casings, and still leaving the fillet in the centre

of sufficient size with care to put a screw through to screw the casing also on to the ground to which it has to be fixed.

Would any of your readers express further opinions on this point? We, as manufacturers, wish to make this material to suit general requirements, and intend to alter our standard pattern very shortly with the outside edges and the centre of equal size unless many expressions of opinion are to the contrary.

Yours, &c.,  
C. JENNINGS & Co.

Pennywell Road, Bristol.  
January 23rd, 1914.

### "HALF-WATT" LAMP FITTINGS

THE two following illustrations show the ventilated fitting for use with "half-watt" lamps which is being put on the market by Siemens Bros. Dynamo Works, Ltd. (Incandescent Lamp and Fittings Department, Tyssen Street, Dalston, N.E.). It may be seen that the "Goliath" Edison screw holder is fastened to a carrier which is mounted on a slide so as to allow some regulation in the position of the lamp in the globe of the lantern. The latter is provided with

FIG. 1.—GENERAL APPEARANCE OF SIEMENS' "HALF-WATT" LAMP FITTING. FIG. 2.—ARRANGEMENT OF COMPONENT PARTS OF FITTING.

an insulated shackle suspension which renders it suitable for use in all weathers. A wire guard may be used if desired to cover the opalescent globe. It is decided to manufacture the fitting in three sizes. The first is suitable for 600 c.p. and 1,000 c.p. lamps; it is 14½ in. in diameter and 24 in. long. The second is suitable for 1,000-c.p. and 2,000-c.p. lamps; it is 18 in. in diameter and 28 in. long. The third size is suitable for 2,000-c.p. to 3,000-c.p. lamps; it is 22½ in. in diameter and 30 in. long.

**Importation of Metal Filament Lamps into the United States.**—According to Mr. E. J. Deuth, of Deuth and Co., New York, there is a large and growing demand in the United States under the new tariff for first-class metal filament lamps of foreign make, says the *Electrical World*, and the imports of these lamps are increasing rapidly.

**Callender's Hospital and Distress Fund.**—The eleventh annual report of this fund records an income from subscriptions and donations of about £350. Gratuities to members in time of need and for the purchase of spectacles and surgical appliances amounted to £95, and £251 was contributed to various hospitals. 336 hospital letters were issued. It has not been found that the Insurance Act has diminished the activities of the fund. The report was adopted at the annual meeting at the Belvedere Works on January 24th, Mr. A. R. Kibblewhite being in the chair.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Aldershot.**—Cable extensions at an estimated cost of about £200 are to be carried out.

**Belfast.**—Additional plant will shortly be required to meet the increasing demands upon the power station.

**Bristol.**—Twelve months' supply of A.C. meters, arc-lamp carbons, joint boxes, &c. Borough Electrical Engineer. February 12th. (See advertisement on another page.)

**Colchester.**—Twelve months' supply of electrical stores. General Manager and Engineer. February 7th.

**Gravesend.**—A loan of £13,600 is to be applied for in connection with new generating plant.

**Halifax.**—Twelve months' supply of various stores. Borough Electrical Engineer, February 16th.

**Hastings.**—A loan for mains extensions is to be applied for.

**Huddersfield.**—A loan of £30,000 for electrical extensions has been sanctioned by the Local Government Board.

**Liverpool.**—The City Electrical Engineer recommends that the second half of the new extension scheme should now be proceeded with.

**London: Hammersmith.**—Twelve months' supply of cables, meters, &c.—Borough Electrical Engineer. February 4th.

**Newfoundland (N.S.).**—According to a Reuter telegram, the Government has granted a concession for the use of water-power to the extent of 1,000,000 h.p. at the Grand Falls, Labrador, for the generation of electricity to be used in connection with the extraction of nitrogen from the atmosphere.

**Newport.**—Twelve months' supply of various stores. Borough Electrical Engineer. February 14th.

**Pontypriid.**—Twelve months' supply of various stores. Borough Electrical Engineer. February 9th.

**Yorkshire.**—The Yorkshire (West Riding) Electric Tramways Co. is to raise additional capital to meet the growing demands of its tramway and lighting business. A provisional order has been obtained for lighting the town of Pontefract.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Burton-on-Trent.**—New cinematograph theatre.

**Croydon.**—Thirty-six houses, Meadvale Road. A. J. Fraser, Mortimer Road, West Ealing.—Thirty-five houses, Charnwood Road. A. E. Bates, Brighton Road, Purley.—Ninety-one houses, Capri Road. J. Weller, Dalmally Road.—Fourteen houses, Ashburton Avenue. T. G. Crump, 5 Station Road.—Forty-two houses, Shirley Park Road. J. B. Hemmings, Addiscombe Road.

**Felixstowe.**—New theatre. H. R. Cooper, Queen Street, Ipswich.

**Hitchin.**—Additions to Isolation Hospital (£27,500).

**Hyde.**—Electrical installation at the Town Hall extensions. Architect, J. H. Fletcher, 45 Clarendon Place.

**Llandudno.**—Drill hall. Architect, E. Evans, 8 Castle Street, Carnarvon.

**London: L.C.C.**—223 wiring points at Hilly Fields elementary school. (See advertisement on another page.)

Rebuilding of Tivoli Music Hall.

**Newcastle-on-Tyne.**—New Town Hall.

**Port Talbot.**—New hospital. Architect, F. B. Smith.

**Richmond (Surrey).**—Additions to Town Hall.

### Miscellaneous

**Australia.**—The Sydney Harbour Trust requires three electric travelling cranes. Tenders by March 2nd. This information is only of use to those firms having agents in Australia who can be instructed by cable.

**Belfast.**—Twelve months' supply of miscellaneous stores. City Electrical Engineer, February 23rd. (See advertisement on another page.)

**Dover.**—A large expenditure upon tramway track reconstruction has been reported to the Council as necessary.

**Greenock.**—150-ton electric crane for Harbour Trustees. Engineer, February 11th.

**Ireland.**—The Midland Railway Co. of Ireland requires a twelve-months supply of electrical stores. Secretary, York Road Terminus, Belfast.

**Liverpool.**—One hundred 40-h.p. double-motor equipments for the Tramways Department. Tramway Manager, February 12th.

## TENDERS RECEIVED AND ACCEPTED

**Grimsby.**—The tender of Messrs. Berry Skinner & Co. has been accepted for motor-starting apparatus, and that of Messrs. H. Green & Co. for motors.

**Leicester.**—A contract has been placed with Messrs. Siemens Bros. Dynamo Works for a second 3,000-kw. turbo-alternator at the Lero Power Station, similar to the one in course of erection, at £11,352.

Contracts have also been placed with the Brush Electrical Engineering Co. for ten canopy-top tramcar bodies at £3,842, and with Messrs. Dick, Kerr for the electrical equipment and trucks at £3,486.

**Norwich.**—The tender of Messrs. Siemens Bros. Dynamo Works has been accepted for H.T. switchgear at £676.

**Rugby.**—The tender of Messrs. W. T. Henley's Telegraph Works Co. has been accepted for cable at £257.

## APPOINTMENTS AND PERSONAL NOTES

We much regret to announce that, owing to continued ill-health, Mr. Bernard M. Jenkin has decided to retire from his partnership in the firm of Kennedy & Jenkin, Consulting Engineers. The partnership will be continued in future by the remaining partners (Sir Alex. B. W. Kennedy, Mr. J. M. Kennedy, and Mr. S. B. Donkin) under the name of Kennedy & Donkin.

Mr. C. W. Bentley has resigned from the managership of the Musselburg & District Electric Light & Traction Co., and is to be succeeded by Mr. Robert Watson, late Secretary of the Company in London. Mr. D. L. Winter, of the Bo'ness Electric Tramways, Ltd., has been appointed Resident Manager.

The Exeter Lighting Committee recommends that the salary of Mr. H. D. Munro, the Borough Electrical Engineer, be increased to £475. It is also recommended that the maximum salary of the chief clerk in the Electricity Department be advanced from £140 to £160 per annum, and that the following maxima be also fixed, viz., mains foreman from 42s. to 45s. per week, assistant jointer from 30s. to 35s., engine drivers from 34s. to 36s., stokers from 27s. to 30s.

The Singapore Electric Tramways, Ltd., requires an assistant electrical engineer. Applications to Secretary, 19 St. Swithin's Lane, E.C.

A shorthand and typewriting clerk is required by a firm of electrical engineers. (See advertisement on another page.)

A mechanic with electrical engineering knowledge is required. (See an advertisement on another page.)

An engineering and mechanical draughtsman is required in the Stoke-on-Trent Electrical Engineer's Department. (See advertisement on another page.)

**Central Suspension Lighting.**—Referring to the small illustrated paragraph on page 54 of our last issue, the Wardle-Engineering Co., Ltd., call our attention to the fact that the London Electric Firm is not alone in supplying suspended lighting units for use with existing tramway poles, and that the Wardle Company themselves manufacture the Barrow suspension device, which has been in use for a long time, having been patented by Mr. Burnett, of Barrow-in-Furness, in 1910. They send us several illustrations of typical arrangements.

FOR  
**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

## A NEW CABLE WORKS

A COMPANY named The Pirelli-General Cable Works, Ltd., has been registered with a capital of £200,000 to carry on the business of "manufacturers of and dealers in india-rubber, gutta-percha and asbestos articles, insulating materials, india-rubber, gutta-percha, insulated and other wires and cables capable of use for telegraphic, telephonic, electric lighting and the conveyance of electricity; electricians, engineers, shipowners, shippers, &c."

The directors are six in number: Mr. Hugo Hirst, Mr. M. Railing, and Mr. E. G. Byng representing the interests of the General Electric Co., Ltd., and Messrs. P. Pirelli, A. Pirelli, and H. Bevis the interests of Pirelli & Co. The erection of works in Southampton on a site adjoining the electric lighting station of that town, and facing the Bay on one side, is proceeding rapidly, and it is expected that the manufacture of all classes of cable, including vulcanised rubber wires and lead-covered cables, will be started in May or June. The buildings should be complete by the end of March. The General Electric Company, in the course of their business at home, and also in connection with contracts abroad, require large quantities of cable of all classes, but have hitherto not manufactured themselves, and it is, we understand, chiefly with a view to supplying their requirements that the new works are being erected.

## LOCAL NOTES

**Aldershot: Diesel Engine Vibration.**—Some inconvenience has been caused at the electricity works alleged to be due to the Diesel engine sets, and the Diesel Engine Co. is sending down a special representative to investigate the probable cause.

**Blackpool: Rateable Value System of Charging.**—The Corporation has adopted a  $12\frac{1}{2}$  per cent. rateable value system of charging for electric supply plus  $\frac{1}{4}$ d. per unit. Under this tariff, of course, current can be used through one meter for any purpose.

**Braintree: Electric Supply.**—Although the Special Committee which is considering an electric supply installation has visited a number of towns, it has been decided to interview a number of other station engineers before finally reporting upon the matter.

**Glasgow: Hiring Electricity Apparatus.**—A special sub-committee has been appointed to report as to the advisability of the Electricity Committee letting out heating and other domestic appliances, as is done by the Gas Department.

**Grimsbay: Street Lighting.**—The Electricity Committee has reported, in regard to a suggestion that the prices for street lighting shall be reduced, that it is unable to recommend this at present. The existing charge averages £19 per lamp per annum for arcs, and the total revenue from this source is £1,609. The charge for street lighting by metal filament lamps is £2 17s. 6d. per 3,000 hours, the same as that charged by the Gas Company, and in both cases the Committee is of the opinion that the charge is a moderate one.

**Leicester: Street Lighting.**—As the result of complaints of the inequality in the street lighting, a special committee was appointed by the Watch Committee some time back to bring forward a re-organised scheme. This has now been prepared, and will consist of first and second grade schemes for the main streets and ordinary streets respectively, whilst the still smaller thoroughfares come within another category. Before developing the scheme, however, it has been decided to make public tests of electricity and gas.

**Liverpool: Electric Lighting Profits.**—It is calculated that £25,000 will be available for relief of rates from the Liverpool electric supply undertaking for the year 1913-14.

**Scarborough: Proposed Purchase of Supply Co.**—The Corporation is now considering a report from their consulting engineer with regard to the proposed purchase of the Scarborough Electric Supply Co.'s undertaking.

**Southampton: Financial Position of Electricity Undertaking.**—We reported a week or two ago a difference of opinion between the Chairman of the Electricity Committee and Mr. H. F. Street, the Borough Electrical Engineer, as to the wisdom of increasing the charge for current for heating and cooking purposes. The Chairman of the Electricity Committee has now succeeded in having instructions given

to the Borough Treasurer to report upon the financial position of the electricity undertaking.

**Stirling: Electricity Charges.**—During the recent negotiations between Mr. George Balfour and the Corporation concerning the suggested purchase of the undertaking, certain terms were put forward by Mr. Balfour which would have reduced the charges to the consumers. The scheme for the purchase, however, has fallen through, but some 300 consumers have now petitioned the Town Council urging that similar terms to those suggested by Mr. Balfour should be offered to them by the Corporation. The matter has been referred to the Lighting Committee for consideration, and the Borough Electrical Engineer has been empowered to arrange terms with consumers where the circumstances of supply are special.

**Tynemouth: Electricity Accounts.**—The figures for the last completed financial year of the Corporation electricity undertaking show a net profit of £945 compared with £1,305 for the previous twelve months. There was a considerable increase in the lighting consumption, but a reduction in the power supply, owing to there being less night work at the various factories in the town than in the previous year.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £67 5s. to £67 10s. (last week £66 10s. to £67).

**Staff Dinner.**—On Friday last, at the Clarendon Restaurant, Hammersmith, the staff and directors of Messrs. Evershed & Vignoles, Ltd., met for their first staff dinner. The chair was taken by Mr. S. Evershed, who, in responding to the toast of the firm proposed by Mr. F. Martin, gave an interesting account of the history of the company, and mentioned that during its career of 20 years the output had increased ten times. A concert arranged by Mr. H. Blundell followed.

**Half-Watt Lamps.**—The London Electric Warehouse Co. (Manners Street, York Road, S.E.) inform us that they are now in a position to quote for export requirements in half-watt lamps in any voltage from 600 to 3,000-c.p., as well as their standard "Metallum" drawn-wire lamps.

**Liquidations.**—In the liquidation of the Prested Miner's Gas-Indicating Electric Lamp Co. a deficiency of £18,896 is shown in the statement of affairs.

**Melbourne Electric Supply Co.**—Applications have been invited for £150,000 five per cent. consolidated debenture stock at 97½.

## NEW COMPANIES

**IRISH TOWNS ELECTRIC LIGHT & POWER CO.** 1 Wellington Place, Belfast. Capital, £5,000.

**ALEXANDRA ELECTRICAL & ENGINEERING WORKS.** Station Road, Letchworth. Capital, £500. To take over an existing business.

**CARLETON ELECTRICAL CO.,** 569 Garratt Lane, Earlsfield, Surrey. Capital, £20,000. To take over certain patent rights for improvements in dynamos, train-lighting systems, &c.

**"Ford" Electric Automobiles.**—According to the *Electrical World* (New York), Mr. Henry Ford, of Detroit, Michigan, will shortly begin the manufacture of a light electric automobile to be sold at between \$600 and \$1,000, i.e., about £150. It is proposed to produce a "runabout" car weighing half a ton, including the Edison nickel-iron battery, which accounts for 405 lb. It is anticipated that runs of 100 miles on one charge will be obtained. An experimental car is now being tested on the streets of Detroit.

**"Half-Watt" Lamps in America.**—The first nitrogen-filled lamps are now in use for street lighting in Seattle, Washington. They are of 80 c.p., and take 6·6 amperes at 8 volts. There are five lamps to each post, and in each pole base is a 250-watt transformer fed at 120 volts. The lamps are run in parallel on the 8-volt secondary. These transformers were installed in 1909 to feed 8-volt "one-watt" lamps. It is reported that the average life of these lamps was over 4,000 hours, and two burned for 12,000 hours and were not then damaged, but were only removed to make room for the new lamps.

## SUMMARY

THE London Electrical Masters' Association have agreed not to discuss with the workmen's representatives any questions as to the wages of central station employees. Some of the statements which have been circulated with regard to the strike, and threatened strike, of electrical workers are absolutely untrue. At present a number of wiremen who were engaged on buildings upon which all work has been suspended on account of the building lock-out are out of work—that is all. (Page 74.)

A CONSTANT pressure A.C. transmission system, in which a leading current is fed into a line of high reactance, was described by Mr. E. P. Hollis in a Paper read before the Newcastle Section of the Institution of Electrical Engineers. Two constructions of large air core reactance coils were also given. In one bare cable is wound over a concrete core provided with resin-filled maple supports, and in the other the cable is wound spirally in a porcelain insulator. (Page 75.)

FIGURES of the energy lost in plain and ball bearings, and other information regarding ball bearings generally, will be found in our Questions and Answers columns. (Page 75.)

A PATENT by H. Bremer relating to flame arc lamps expires during the current week after a full life. The specifications published by the Patent Office last Thursday include one by C. O. Bastian for the manufacture of resistance helices for heating elements, and one by E. M. Fraser for a two-motor lift equipment. Two patents by C. W. Read relate to strengthening metal filaments and to making the central stem of the

 **BINDING "ELECTRICAL ENGINEERING."**—Vol. IX. of "Electrical Engineering" (Jan.—Dec. 1913) closed with our issue of December 25th, 1913. Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to THE KILOWATT PUBLISHING CO., LTD., Temple Chambers, London, E.C., carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad. Binding Cases (including index, but not including binding) 2s. each, or post free 2s. 4d. (Abroad 2s. 6d.) Index alone, 1d. (Post free 2d.).

spider for metal filament lamps of a cylindrical silvered reflector. (Page 77.)

HIGH-PRESSURE direct current with overhead contact line is recommended by Mr. C. H. Merz for the electrification of the Bombay suburban railways. A return of nearly 9 per cent. on the capital outlay is expected.—The report of the East London Railway for the first seven months' electrical working states that there has been an increase in the number of passengers carried and in the revenue, but the increase is not yet sufficient to provide an adequate return on the capital sunk in the electrification.—A conference of police, road, tramway, and omnibus authorities is being convened to arrive at mutual arrangements as to stopping places, &c.—The Dublin United Tramways Co. is only able to pay a dividend of 5½ per cent. for 1913, owing to the strike troubles. (Page 78.)

IN the course of a Paper on loaded aerial telephone lines, read before the Institution of Post Office Electrical Engineers, Mr. J. G. Hill mentioned that Pupin coils are generally spaced about 2½ miles apart. The Post Office will soon have 70,000 miles of loaded underground circuits, as well as submarine cables and a few aerial lines.—Wireless telegraphing between moving trains and stations near the track has been successfully achieved on the Delaware, Lacawanna, and Western Railway of America.—A committee has been appointed by the Post Office to inquire into the systems of high-speed telegraphy. (Page 78.)

A PAPER by Mr. J. F. Aust deals with some practical notes on colliery electrical equipment. The author points out the necessity for reliable signalling systems, and insists on perfect insulation being maintained. A satisfactory method of fixing lamps to girders is described, and an armature fault tester illustrated. (Page 80.)

THE coroner's jury in the Senghenydd disaster was unable to state whether the gas was ignited by sparks from a signal wire, but considered that the evidence pointed to a naked light at the lamp station as the cause of the explosion. The Home Office inquiry is proceeding. (Page 79.)

A PATENT specification relating to "gate end boxes" was published by the Patent Office last month. Two other specifications relating to miner's safety lamps were also published. Several specifications of interest to electrometallurgists were also published. These deal mostly with furnaces, and with the production of high grade steel. (Page 81.)

A SWITCHBOARD at a copper mine is illustrated. (Page 81.)

DESCRIPTIONS are given in our Trade Section of some new metal filament lamps which concentrate the light in the axial direction, and of a fitting for half-watt lamps. (Pages 81 and 82.)

New plant, mains, &c., are required at Accrington (£33,500); Haslingden (£8,200); Taunton (£4,950); Peterborough (£850); Croydon, Hornsey, Rhondda, Wrexham, Stockton, and Ipswich. 20,000-volt and 1,500-volt cables are required for the Melbourne Electric Railways, and D.C. motor-starters by the N.S.W. Railways Department. (Page 83.)

Two independent experts are to report upon the Southampton electricity undertaking.—A scheme for dealing with the Eastbourne mains is being drawn up.—Progress is being made with the Wood Green electric lighting undertaking.—There has been a demonstration of electric vehicles in Ipswich. (Page 84.)

AN issue of new capital is being made by the Victoria Falls & Transvaal Power Co. (Page 84.)

## THE UNREST AMONG ELECTRICAL WORKMEN IN LONDON

MR. HORACE BOWDEN informed us yesterday that he had resigned the Chairmanship of the London Electrical Masters' Association, and that the Association had agreed that they would not discuss with the workmen's representatives any questions as to the wages and status of central station employees. Mr. Bowden is also about to resign from the Committee, and Mr. L. L. Robinson (Borough Electrical Engineer, Hackney) and Mr. L. H. Hordern (Westminster Electric Supply Corporation) have already resigned from it, so that the Committee is now only representative of the wiring contractors. The only other supply representatives in the Association at present are Mr. A. H. Seabrook (Marylebone) and Mr. A. J. Fuller (Fulham). The Westminster Co. has retired from the Association altogether, so that there are no supply company representatives in it, and it is not improbable that the representatives of the Borough Council Electricity Departments will follow suit. A meeting to discuss the matter was held yesterday afternoon, but had not concluded when we went to press.

On the side of the officials of the Association of Electrical Station Engineers (the Association of central station hands referred to in our last issue) there is now also a clear indication that they do not desire to be drawn into the present dispute, which turns mainly on wiremen's wages, recognition of the Electrical Trades Union (which is the wiremen's union), and the position of the wiremen with regard to the dispute in the building trades. Last night a general meeting of this Association was held, at which the following resolution was down for discussion:—

Owing to the fact that the London Electrical Masters' Association does not appear to represent the supply authorities of London and Greater London, this meeting instructs the London Committee of the Association of Electrical Station Engineers to circularise all supply authorities, asking them to form a committee to discuss with the A.E.S.E. conditions of working, hours of labour, and rates of pay.

In the meantime we are asked by Mr. W. J. Ebben, the Hon. Sec. of the Association, to repudiate statements which have been circulated that the Association is amalgamating with the Electrical Trades Union; and we can equally deny the statements, deliberately put into circulation by those whose interest it is to magnify the present dispute, that the Association of Central Station Engineers may be relied on to co-operate with the Trades Union, and to call out its members in sympathy with the wiremen, so as to threaten a stoppage of electricity supply, trams, and tubes in the metropolis. There is not a vestige of truth in this. Central station employees, whether members of this Association or not, are too sensible to allow themselves to be made a "cat's-paw," and to risk losing their employment merely so as to interest the general public in the dispute in the building trade.

So far as the wiremen's dispute itself is concerned, matters are practically where they were last week. Owing to the

building lock-out, it is difficult to find employment for a number of wiremen who would otherwise be engaged, and it seems to have given satisfaction to the Electrical Trades Union to say that the men out of work have struck in sympathy. There may have been isolated cases of this, but in general, we understand, those men who are out of work are simply idle because all operations on the buildings upon which they had been engaged are suspended.

The London Electrical Masters' Association held a private meeting on Tuesday, to which Press representatives were not admitted; but whether they have decided to meet representatives of the Trades Union or not, they will, of course, adhere to the agreement mentioned in the opening of this article not to discuss with them matters relating to the central station workmen.

Mr. W. G. Sutton (Senior Charge Engineer of the St. Pancras Borough Council Electricity Works) writes us as follows:—

"In your issue of the 29th, in a report of the meeting held at the Memorial Hall on the previous Monday, it was stated that the whole of the employees in the Electricity Department of the St. Pancras Borough Council had joined the Union. On behalf of the generating staff you must allow me to correct this statement, or rather misstatement. In the generating stations the Electrical Trade Union have not one member, or prospective member. Also there were none of the generating staff present at that meeting. I think the speaker on that occasion should have verified the facts of the case before making misleading statements."

The announcement in question was formally made by the District President of the Electrical Trades Union, in the course of the meeting in question. Incorrect and misleading statements of this nature will certainly not enlist sympathy for the Electrical Trades Union. Nor is the statement correct if applied only to the outside staff of the electricity department (jointers, meter readers, &c.), for we are informed that less than 10 per cent. of the comparatively small number of men so engaged are members of the Union.

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, FEBRUARY 5TH.

*Institution of Electrical Engineers.*

7 for 7.30 p.m. Annual dinner at Hotel Cecil.

FRIDAY, FEBRUARY 6TH.

*Institution of Electrical Engineers: Scottish Students' Section.*

8 p.m. At Royal Technical College. "Wireless Telegraphy," by D. J. MacKellar.

MONDAY, FEBRUARY 9TH.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. At Armstrong College. "Suggested Methods of Improving the Telephone Service," by W. Aitken.

*Institution of Post Office Electrical Engineers.*

6 p.m. At Institution of Electrical Engineers. "A Modern P.O. Wireless Station," by F. Addey.

TUESDAY, FEBRUARY 10TH.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At University. "The Cascade Induction Motor," by L. J. Hunt.

WEDNESDAY, FEBRUARY 11TH.

*Institution of Electrical Engineers: Birmingham Section.*

7.30 p.m. At the University. "Some Railway Conditions governing Electrification," by Roger T. Smith.

*Institution of Electrical Engineers: Yorkshire Section.*

7.15 p.m. At Philosophical Hall, Leeds. "The Cascade Induction Motor," by L. J. Hunt.

THURSDAY, FEBRUARY 12TH.

*Institution of Electrical Engineers.*

8 p.m. "Some Railway Conditions Governing Electrification," by Roger T. Smith.

FRIDAY, FEBRUARY 13TH.

*Royal Institution.*

9 p.m. Evening Discourse by Prof. J. Norman Collie, F.R.S., on "Production of Neon and Helium by Electric Discharge."

SATURDAY, FEBRUARY 14TH.

*Royal Institution.*

3 p.m. Afternoon Lecture I, on "The Electric Emissivity of Matter," by Dr. J. H. Harker, F.R.S.

## REACTANCE COILS IN POWER CIRCUITS

A PAPER entitled "Reactance and Reactance Coils in Power Circuits" was read by Mr. E. P. Hollis before the Newcastle Section of the Institution of Electrical Engineers at Newcastle, on January 26th. It was also read at Middlesbrough on January 30th. The author reviewed the part played by inherent and added inductance in the phenomena that occur in power circuits. In order to promote general stability, inductance coils are now largely used, especially on large transmission and distribution schemes. Besides the use of reactance coils connected to generators, motors, and transformers to minimise the effects of bad switching, to protect the machines in case of short-circuit, &c., they are used with circuit-breakers having two contacts. When the first opens inductance is put in series with the load. The second then opens the circuit. For transformers, concluded the author, it is better to obtain any large amount of reactance by the aid of external coils, and if the risk of internal disorders is considered immediate the transformer should be protected by a shunted discharger. A scheme of constant pressure transmission was also outlined. The theory on which the proposals are based is that a leading current flowing through a reactance experiences a rise in pressure. In most lines it would be necessary to add reactance coils in series, preferably at the generating end of the feeders. A frequency of 50 cycles would be better than one of 25. The leading current would be produced by synchronous condensers, over-excited motor-generators, and (but not advisedly) rotary-converters situated at various points about the system. The short-circuit power would be less than the full-load power, so that there would be no general interference with the system. For the load current the reactance is compensated by the leading current. The author concluded:—"The addition of line reactance together with the introduction of reactive power would appear at first sight to occasion an increased line loss. There is, however, no diminution of efficiency, since, owing to the higher voltage, the same work can be done with a smaller number of amperes, and it is therefore found that the efficiency does not suffer."

The problem of the construction of large adjustable coils appears to be met best by superposing a continuous flux on the alternating flux, so as to give the core a magnetic bias. The coil thus takes a higher magnetising current, but the author does not believe that the potentialities of this method of adjustment have yet been realised. It is cheaper to construct nearly all these large coils with air cores. Several constructions are adopted in practice. In one, bare copper cable is wound under tension on wooden supports covered with asbestos and bolted to a cylindrical concrete cone. Each end-turn is rigidly held by alloy clamps to the wooden supports, which are composed of resin-filled maple, having a disruptive strength of over 75 kv. per in. across the grain and 30 kv. per in., along the grain. In another design the pancake, instead of the drum winding, is adopted. The horizontally wound spirals are supported in recesses formed in porcelain arms which radiate from a central cone of Alberene stone to an outer enclosing well built up of porcelain segments. Concrete headers, one at either end, are fastened to the wall by mica-insulated brass rods.

**The Queen's Engineering Works Magazine.**—An interesting number of the magazine conducted at the Bedford works of W. H. Allen, Son & Co., Ltd., has just reached us. A number of the articles deal with travel, and visits are described respectively to India, the Persian Gulf, Japan (via Siberia), and Palestine. Technical matters dealt with include reports of a lecture on wireless telegraphy by Capt. Sankey at the annual distribution of prizes to pupils and apprentices, and of the summer meeting of the Institution of Mechanical Engineers, the kinetic air pump, modern foundry practice, and the efficiency of slide valves, and one of the most interesting contributions is a vivid account of the part played by the *Iron Duke* in saving the burning *Scotsdyke* during her steam trials. Mr. W. H. Allen also contributes an article on the launch of H.M.S. *Queen Elizabeth*.

**Old Centralians.**—The 16th Annual Dinner of the City and Guilds College Old Students Association will be held at the Trocadero Restaurant, Piccadilly Circus, W., at 7.30 p.m. on Saturday, February 21st, and will be preceded at 6.45 by the Annual General Meeting. Dr. G. T. Moody, D.Sc., F.C.S., President of the Association, will take the Chair. Tickets (price 6s. 6d. each) may be obtained by any old student of the "Central" from G. W. Tripp, 4 Fairfield Road, Charlton, Kent.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,377.

What are the more usual methods, other than the use of automatic regulators, for compounding alternators? How is the compounding effected, and what are the relative advantages of the different methods? Also, is it practicable to "over-compound" a machine in this way.—"F. M."

(Replies are limited to 800 words, and must be received not later than first post, Thursday, Feb. 12th.)

### ANSWERS TO No. 1,375.

Give particulars of any rules or curves showing the power lost (in watts) in ring lubricated brass bearings, compared with the power lost in ball bearings suitable for the same load and speed. Compare also the probable life of the above two types of bearings. If possible tabulate the minimum number of balls per bearing and diameter of each ball and ball race, against maximum load per bearing and maximum safe speed of the inner ball race for both ball and thrust bearings. Is the true spherical, or elliptical, shape of ball race the most reliable? When is it advisable to depart from ball to roller bearings?—"F."

The first award (10s.) is given to "MARF" for the following reply:—

The following table is the result of tests conducted at the National Physical Laboratory on ordinary brass bearings and ball bearings. The journal in each case was 2½ in. dia., loaded up to 2,300 lbs., and supported, first, by two ordinary bearings, and afterwards by two of the ball-bearing type. The ordinary bearings were three diameters long, fitted with two oil rings for automatic lubrication. The ball bearings were of the "Hoffmann" type:—

Speed in R.P.M.	Load per Bearing	Coefficient of Friction.		Power lost in Friction	
		Ordinary	Ball Bearing	Ordinary	Ball Bearing
80	1,150 lbs.	·015	·0013	20 Watts.	1·78 Watts.
130	"	·014	·0014	30·7 "	3·07 "
250	"	·013	·0015	55·3 "	6·25 "
500	"	·012	·0016	102·2 "	13·6 "

The life of a ball bearing depends almost entirely on the conditions of working. Provided it is not overloaded or subjected to shocks, the amount of wear is practically nil; a small amount of end thrust, or overloading, will, however, quickly ruin the most carefully made ball bearing.

The sizes in the following table have been compiled from recent practice, and the safe loads were computed from the formula established by Mr. R. Stribeck:—

$$\text{Safe load} = k n D^2,$$

where  $k=9$  for bearings provided with ball cages,  $n$ =number of balls, and  $D$ =diameter of balls in eighths of an inch.

It will be seen that the loads thus found agree quite well with the formula lately put forward by Professor Goodman:—

$$P = \frac{K n d^3}{N D + C d}$$

where  $P$ =max. safe load on bearings in lbs.,  $d$ =dia. of balls in inches,  $D$ =dia. of ball race,  $m$ =number of balls in bearing,  $N$ =revs. per min.,  $K=1,250,000$  for thrust bearings or 2,500,000 for journal bearings, and  $C=200$  for thrust bearings or 2,000 for journal bearings (see Fig. 1).

Table for Radial Ball Bearings.

Size of Shaft B in inches	Dia. of Ball Race D in inches	Dia. of Balls d in inches	No. of Balls	Safe Load.		
				R. P. M.		
				300	600	1,200
$\frac{1}{2}$	$1\frac{1}{8}$	$\frac{7}{16}$	8	405 lbs.	250 lbs.	140 lbs.
1	$2\frac{1}{8}$	$\frac{7}{16}$	10	980 "	610 "	350 "
2	$3\frac{1}{8}$	$\frac{7}{16}$	14	2,550 "	1,750 "	1,050 "
3	$5\frac{1}{8}$	$\frac{7}{16}$	16	5,600 "	3,920 "	2,200 "
4	$7\frac{1}{8}$	1	16	7,850 "	5,776 "	3,550 "

Table for Thrust Ball Bearings.

Size of Shaft B in inches	Dia. of Ball Race D in inches	Dia. of Balls d in inches	No. of Balls	Safe Load.		
				R. P. M.		
				150	300	1,200
$\frac{1}{2}$	$1\frac{1}{8}$	$\frac{7}{16}$	8	330 lbs.	285 lbs.	217 lbs.
1	$2\frac{1}{8}$	$\frac{7}{16}$	10	620 "	525 "	451 "
2	$3\frac{1}{8}$	$\frac{7}{16}$	14	1,650 "	1,250 "	975 "
3	$5\frac{1}{8}$	$\frac{7}{16}$	16	3,450 "	2,600 "	2,170 "
4	$6\frac{1}{8}$	1	16	4,400 "	3,500 "	3,100 "

Light gunmetal cages should be used to keep the balls apart. For a given number of balls, the elliptical form of ball-race is more reliable than the spherical form, because it affords a larger arc of contact with each ball, and consequently will support a bigger load. The friction is rather more for elliptical

RADIAL THRUST BEARING. BEARING.  
FIG. 1.

FIG. 2.—PERMISSIBLE BEARING PRESSURES FOR VARIOUS RUBBING SPEEDS FOR JOURNAL BEARINGS.

(or, strictly speaking, "ellipsoidal") races than for spherical ones. The tables given above are based on the assumption that elliptical races are used, the smaller radius of curvature being  $\frac{1}{8}$  × diameter of ball.

The second award (5s.) is made to W. A. WOOD, who writes as follows:—

In designing journal bearings, neither the pressure nor the circumferential speed alone can serve as a standard for calculating dimensions. The product of the pressure by the speed and the coefficient of friction must be taken into account; this is the work of friction. With this type of bearing, running at a high rubbing speed, the dissipation of heat becomes an important problem, and in many cases cooling devices by the circulation of water or oil have to be resorted to. On the other hand, with properly designed and operated ball and roller bearings, the amount of energy liberated in heat is so slight that it is a negligible factor in design.

Turning now to the watts lost in bearings, if  $f$ =coefficient of friction,  $W$ =load in pounds,  $d$ =diameter in inches, and  $n$ =number of revolutions per minute, we have

$$\text{Watts lost} = \frac{f\pi dn W \times 746}{12 \times 33,000} = .0059 f dn W.$$

Thus, with the same load and r.p.m., the relative losses in journal and ball bearings will vary as the coefficients of friction and the radius at which this acts. In the case of ball bearings, this radius will be from 1.8 to twice that of journal bearings.

To find the value of  $f$  for journal bearings, care must first be taken to select a suitable bearing pressure for the particular speed at which the shaft runs. Fig. 2 shows this relationship to ensure perfect film lubrication. Having selected this, Fig. 3 shows the relationship between the pressure density and the coefficient of friction.

It will be noted that for moderate pressures and speeds the coefficient of friction varies, approximately, inversely as the

normal pressure, but is very high for low speeds, and for very high speeds is approximately independent of the velocity.

Turning now to ball bearings, great care must be taken to ascertain whether the shaft is liable to be subjected to any end thrust, since even if this be present to a very slight degree, the coefficient of friction is raised enormously. Fig. 4 illustrates this characteristic. If it is thought that no end thrust will be present, 0.002 will be a fair value to take for any speed.

The governing principle in regard to the shape of the races is that the ball shall roll over them, and not slide. If it were possible to so shape the groove that all parts would sustain the load equally, we would have a condition of maximum sustaining capacity of the ball. Such a groove would be represented by a profile semicircular in section, with the radius of curvature equal to one-half the ball diameter. Because of excessive friction, this form is not practicable. This is one limit. Turning to the other limit, if we begin with a cylindrical race the sustaining power increases without a proportionate increase of friction as the curvature is increased up to the point of equality of curvature, when sliding sets in, and with that a change from rolling to sliding friction. For best proportions the radius of curvature for outer race groove =  $\frac{1}{8}$  ball diameter, and that of the inner groove  $\frac{1}{16}$  ball diameter.

According to Professor Stribeck, the capacity of a ball bearing in pounds =  $k\pi D^2$ , where  $n$ =number of balls,  $D$ =diameter of ball in inches, and  $k=580$  when no end thrust is present, to 60 when end thrust takes place.

For thrust bearings, account must be taken of the speed.

Thus, permissible load in pounds =  $30,000 \frac{nD^3}{a\sqrt{s}}$ , where  $D$ =ball

diameter in inches,  $n$ =number of balls,  $a$ =pitch diameter of the ball grooves in inches, and  $S$ =speed of shaft in revs. per minute.

The following are corresponding formulæ for roller bearings, and are based upon careful records of a large number of bearings in successful use:—

$$\text{Capacity in pounds} = 130,000 \frac{d^2 n l}{3s}$$

where  $d$ =diameter of rollers in inches,  $n$ =number of rollers,

FIG. 3.—RELATION BETWEEN BEARING PRESSURE AND COEFFICIENT OF FRICTION FOR LUBRICATED JOURNAL BEARINGS.

FIG. 4.—COEFFICIENT OF FRICTION FOR BALL BEARINGS UNDER VARIOUS CONDITIONS.

$b$ =length of each roller in inches,  $S$ =circumferential speed in feet per minute of each roller; while for thrust roller bearings

$$\text{Capacity} = 100,000 \frac{d^2 n l}{s}$$

As to the choice of any particular type of bearing, many factors present themselves, ring lubricated plain bearings being selected for cheapness and moderate speeds, while if easy starting is essential, ball bearings, or roller bearings for heavier loads, must be used. The latter types generally require far less attention than journal bearings, but extreme care must be taken to ensure perfect alignment, and that no moisture is allowed to enter the races. With regard to the probable life of journal bearings, theoretically speaking, no wear should take place, since if properly proportioned a film of oil should prevent actual metallic contact between the shaft and brasses. In actual practice, however, these conditions may be upset by jars, radial overloading due to unbalanced centrifugal forces, and grit. With ball and roller bearings the same remarks apply, with this disadvantage, that once the races and balls are scored or worn, they must immediately be discarded for new ones, whereas split bearings can often be adjusted and trimmed up. It is always advisable to use ball bearings for taking continuous thrusts. I regret I am unable to discriminate between the limits of ball and roller bearings, as each particular scheme must be considered on its own merits.

**Boiler Explosions.**—The Manchester Steam Users' Association has issued its annual memorandum by its chief engineer, Mr. C. E. Stromeyer. The memorandum analyses and correlates a large number of experiments on the strengths of flat plates, including those carried out nearly 40 years ago in consequence of the explosion on board H.M.S. *Thunderer*, as well as experiments carried out by the Board of Trade, the German Admiralty, the Association itself, and by private individuals. Results are arrived at which should be of great use to steam users in general and to designers and constructors of boilers. The address of the Association is 9 Mount Street, Albert Square, Manchester.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Jan. 29th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**

8,144/12. **Heating Elements.** C. O. BASTIAN. A wire is wound on a mandril with its contiguous convolutions actually in contact. The mandril is removed and a coating of the oxide of metal of which the wire is composed is formed on it by heating for about five minutes in a flame or muffle. Two figures.

27,859/12. **Tungsten for Drawn Wire Filaments.** C. GLADITZ. An abstract of this specification will appear next week.

49/13. **Indicating Temperature and Hygrometric Condition of Halls, &c.** L. E. HILL. A wet-bulb thermometer of special construction has a resistance in an electric circuit in it, and means are provided whereby the resistance of an adjustable rheostat in the circuit is increased or decreased upon the temperature of the thermometer rising or falling from a predetermined point through a polarised electromagnet. A recording ammeter or wattmeter in the circuit may be calibrated to show "degrees of comfort." Three figures.

235/13. **Luminous Speed Indicator.** F. FAIGLE. The indications, by means of differently coloured signals, are perceptible during equal units of distance in vehicles or for a constant number of revolutions in the case of stationary machines. The lamps are connected to contact studs which are alternately bridged by a switch driven from the vehicle wheels or their equivalent. Several modifications are described. A watch or clock is necessary to calculate the speed from the indications given. Twenty-six figures.

736/13. **Wireless Radiator for Aeroplanes.** SIGNAL GES. The surface of the aeroplane is made conducting so as to serve as one member of the radiating system, and the other member is elevated over the aeroplane by masts, rods, &c., e.g., a mast near the centre of the aeroplane has wires from its cap to the further ends of the surfaces of the machine. These wires are divided into two parts by strain insulators. One figure.

7,151/13. **Control of High-Frequency Alternating Currents.** B.T.-H. Co. (*G.E. Co., U.S.A.*). To control the output from a high-frequency generator, two reactance coils in series are provided in its circuit, and these are subjected to the magnetising action of a pulsating controlling current. This acts in opposite ways on the two coils. Five figures.

11,874/13. **Vacuum Cleaner.** A. G. BLOXAM (*Bergmann A.-G.*). A heating element is inserted in the air pipe of a suction cleaner. It is connected in series with the driving motor, and is preferably placed in the pressure pipe in place of the dust-collecting vessel.

13,447/13. **Lifts.** E. M. FRASER. The armature shafts of two motors with rotating fields are mechanically connected so that one machine will always act as a motor when the other acts as a dynamo. The reactive thrust of the armature on the fields is transmitted to a lift car and counterweight. Control is effected on the two fields. Three figures.

13,695/13 and 16,770/13. **Metal Filament Lamps.** C. W. READ (F. & E. Stanton, Armoury Mills). Filaments are strengthened by being flattened and made concave by pressure or by passing through rollers or dies. According to the second specification, a hollow cylindrical silvered reflector fused to the lamp pip is used as the stem of the spider. It has a longitudinal slip to provide for expansion. There are two figures to each specification.

22,029/13. **Track Circuit Railway Signalling.** SOC. ANON. WESTINGHOUSE. In specification 27,276/11 a resistance with positive temperature coefficient is used to keep the signalling current constant. In this specification the use of a resistance with negative temperature coefficient is claimed.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** DATTA [Machines for giving conductors a fibrous covering] 1,343/13; PEARCE and WILKINSON [Arc lighting] 6,964/13.

**Dynamos, Motors, and Transformers:** MEYERS [Apparatus for producing electricity] 1,098/13; VON ZWEIFBERGK [Brush-holders] 1,337/13; SIMMS [Magnets for ignition and lighting combined] 1,501/13; RATLING and GARRARD [Current equalising in rotary converters] 11,905/13.

**Electrometallurgy and Electrochemistry:** LEE and BRAME [Electroplating] 13,747/12; HENRI, HELBRONNER and VON RECKLINGHAUSEN [Sterilisation] 28,660/12; WHITE [Production of alkali compounds] 1,935/13; NODON [Electrical treatment of cellulose] 6,668/13.

**Ignition:** UNITED MOTOR INDUSTRIES and DE RODAKOWSKI [Spark plugs] 20,929/13.

**Incandescent Lamps:** GLADITZ [Wire-drawing] 8,288/13; SIEMENS BROS. (*Siemens & Halske*) [Fusing tungsten] 10,369/13.

**Instruments and Meters:** LANDIS & GYR [Base plate] 15,811/13.

**Switchgear, Fuses and Fittings:** OLMSTED and BOOTHMAN [Motor controllers] 745/13; PHILLIPS [Candle lamp-holder] 2,764/13; BOON and WILKINSON [Anti-vibration lamp-holders] 5,494/13; CUMONT [D.C. motor controllers] 7,983/13.

**Telephony and Telegraphy:** WESTERN ELEC. CO. (*Western Elec. Co., U.S.A.*) [Paper roll holder for printing-machines] 999/13; [Selective impulse transmitters] 9,703/13; PECORINI [Loud-speaking telephone for closed vehicles] 1,069/13; PALMER [Telephone transmitters] 8,841/13; CONNER and KAHL [Telephone indicators] 9,818/13.

**Traction:** BULFIN [Connection of motors on rail vehicles to prevent side swing] 672/13; ANDERSON [Trolley wheels] 17,850/13.

**Miscellaneous:** MOORE-LICHT A.-G. [Vacuum tube lighting] 1,218/13 and 8,712/13; ELIA [Submarine mines] 1,316/13, 1,327/13, and 1,333/13; ALEXANDER (*Anderson Winding Machine Co.*) [Coil winding machines] 3,515/13; RHEINISCHE-METALLWAAREN UND MASCHINENFABRIK [Setting key for fuses] 18,424/13; NEU [Portable lamps] 22,707/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** ESTÈVE [Lamps fed by induction apparatus driven by irregular actuating means] 133/14.

**Dynamos and Motors:** SIEMENS-SCHUCKERT [Braking A.-C. commutator motors] 299/14.

**Electrometallurgy and Electrochemistry:** RENNERFELT [Furnaces] 226/14; PERMUTIT A.-G. [Alumino-silicates] 353/14.

**Ignition:** WULYAMAZ [Starting motors] 29,715/13.

**Incandescent Lamps:** VEREINIGTE GLANZSTOFF FABRIKEN A.-G. [Manufacture of filaments from crude viscose] 826/14 and 834/13.

**Switchgear, Fuses and Fittings:** BOSCH [Container for granular resistance varied by pressure] 28,824/13; BROWN, BOVERI [Liquid resistances] 29,713/13.

**Telephony:** SIEMENS & HALSKE [Party line] 24,333/13.

**Miscellaneous:** KERSCHBAUM [Metallic vapour lamp] 11,991/13; FRIEDR. KRUPP [Destroying residual magnetism] 28,715/13; KRANSHAAR [Miners' safety lamp] 134/14.

The following Amended Specification may now be obtained:—  
**Switchgear, &c.:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [Dynamic braking and control of planing machine motors] 22,664/12.

### Application for Restoration of Patent

26,042/07. **Fire Indicators and Extinguishers for Ships.** W. RICH. The patentee has made application for restoration of this patent, which expired on November 25th, 1911, owing to the non-payment of the renewal fee. Notices of opposition before March 23rd.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

2,260\* of February 5th, 1900. **Flaming Arcs.** H. BREMER. The carbons may be vertical or inclined, and are both burned together equally. Cylinders are arranged to surround one or both of the carbons, and are closed at the top ends to intercept the air current and prevent it reaching the arc. This specification originally contained eight claims, but six of these were struck out, and the remaining two amended in 1908.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, &c.:** W. F. GRADOLPH and W. C. HAHNE [Reducing induction in telephone and A.C. lines] 22,737/07.

**Electrochemistry and Electrometallurgy:** C. BENSINGER [Electrotype moulds] 22,014/08.

**Ignition:** F. W. HOWORTH (*M. P. Ryder, U.S.A.*) [High-pressure magneto: The voltage is independent of the engine speed, and magneto may be started by hand] 22,368/04.

**Incandescent Lamps:** P. BANTA [Machine for making small pipless cylindrical lamps] 20,989/05.

**Telephony and Telegraphy:** W. C. FAIRWEATHER (*Kellogg Switchboard & Supply Co., U.S.A.*) [Telephone plugs and jacks: No jack springs, but plug has spring tip] 22,440A/03; I. B. BIRNBAUM and H. G. WHITE [Intercommunication telephone system] 21,995/04; T. A. GARRETT and W. LUCAS [Submarine signalling] 21,727/08; G. BURNBY and W. F. BRINKMANN [Intercommunication telephones: Addition to No. 21,995/04] 25,446/08.

**Traction:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [A.C. track circuit signalling] 21,596/08; R. PETERSEN [Overhead] 21,826/08.

**Miscellaneous:** K. SCHAFFLER and D. WEISS [Shot firer] 22,648/07; A. NEWALL [Anti-vibration suspension] 22,003/08.

## ELECTRIC TRACTION NOTES

Mr. C. H. Merz has now issued his report on the question of converting the Bombay suburban railways to electric traction. The lines involved include those of the Bombay, Baroda, and Central India, and the Great Indian Peninsula Railways, and the Bombay Port Trust. Mr. Merz estimates the cost of conversion at £780,972, and expects an annual saving of £5,158 on the present operating costs, assuming a 20 per cent. increase in average speed, and a much increased train mileage, resulting in additional traffic sufficient to produce a return of 8.98 per cent. on the capital outlay. The overhead wire system, with high-tension continuous-current, is recommended in preference to third rail supply, on account of local conditions. The Great Indian Peninsula Railway has also under consideration the conversion of part of its main line out of Bombay.

The report of the East London Railway Co. for the year to December 31st shows that since the introduction of electric traction on April 1st, 1913, there has been a considerable increase in the number of passengers carried, and also in the net revenue. At the meeting last week, Lord Claud Hamilton, the Chairman, expressed his dissatisfaction with the results of the seven months' electrical working, but thought it only fair to give the new system a longer trial before expressing a definite opinion. Up to the present, however, he was inclined to attribute the result to motor omnibus competition, which, nevertheless, he thought would not be so serious in the future, when the novelty of this form of traction had worn off, and the public realised the extra comfort of travelling in electric trains.

The Midland Railway Co. is said to be contemplating the electrification of its line from St. Pancras to Hendon.

Work has been started upon the first section of the Post Office tube railway, from Paddington to Whitechapel.

In response to representations by the London County Council, the Home Secretary is arranging for a conference between the police, road, tramway, and omnibus authorities in London, with a view to mutual arrangements as to stopping places, &c. During recent years, for some reason the police authorities have been inclined in several places to allocate the present tramway stopping-places to the omnibuses, endeavouring, at the same time, to remove the tramway stopping-places to a less convenient place. Seeing that the tramways had these stopping-places fixed by the Board of Trade long before omnibuses were on the streets, there is, not unnaturally, considerable resentment at the attitude taken up by the police authorities, and this is the most important matter which will be raised at the proposed conference.

As a consequence of the strike troubles, the revenue of the Dublin United Tramways Co. in 1913 shows a reduction of £21,100, whilst the expenditure has increased by £2,410. The  $5\frac{1}{2}$  per cent. dividend recommended is in consequence less than that paid in the previous year.

It is calculated that £100,000 will be available for relief of rates from the Liverpool tramways undertaking for the year 1913-14.

The Anglo-Argentine Electric Tramways Co. is issuing £1,500,000 5 per cent. debenture stock at 95.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The problem of the feasibility of loading aerial lines in this country was dealt with by Mr. J. G. Hill in a Paper read before the Institution of Post Office Electrical Engineers on January 12th. The author first discussed the problems of distortion and attenuation, and deduced simple proofs of the more general and widely used formulae. A large number of careful tests on experimental loaded lines were cited, and the results analysed. The results show that the loading of the longer aerial lines is likely to prove advantageous if the degree of insulation on the main line used in the tests (London to Leeds) can be maintained, as appears likely. Direct comparison between loaded and unloaded circuits, of exactly the same type, showed a distinct degradation of articulation on the loaded circuits, but was "commercially satisfactory." No line, the author said, the transmission efficiency of which was as good as eight miles of standard cable, should be loaded, even if terminal transformers were employed. There does not appear to be so much probability

of the successful working of superimposed or phantom circuits on loaded overhead lines as on underground cables, unless the insulation can be improved. The Post Office has at present over 13,000 loading coils in use in underground circuits, and nearly 15,000 more are in process of installation in lead-covered cables. These are generally spaced two-and-a-half miles apart, so that the Post Office will shortly own approximately 70,000 miles of loaded underground circuits, in addition to the submarine loaded cables and a few aerial lines.

According to the *Electrical World* (New York), wireless telegraphy between moving trains on the Delaware, Lackawanna and Western Railway has proved very successful. The train aerial is carried on the four forward cars, and consists of four horizontal wire rectangles. It aggregates about 250 ft. in length and 10 ft. in width, and is 12 ft. above the rails, but is only 2 ft. from the steel of the cars. The instruments are of 1-kw. rating. The 30-volt train lighting dynamo and storage battery feed a motor-generator set which gives 250 volts at 270 cycles per sec. A ten unit quenched gap and three glass jar condensers of 0.004 mfd. capacity each are used. Wireless stations have been erected along the track. The measure of success obtained may be gauged from the following extract:—"It is now possible to communicate with stations in New York until the train reaches Dover, N.J., about forty miles out. Fifty-three miles further, after passing Stroudsburg, Pa., signals may be sent from the train to Scranton, about fifty miles away, and from that time on Scranton is able to read all that is sent by the train operator. Signals from Scranton are first picked up when the train is near Tobyhanna, about thirty miles away."

The Postmaster-General has appointed the following Committee to inquire into systems of high-speed telegraphy, and to report thereon:—Captain Norton, M.P., Assistant Postmaster-General (Chairman); Sir John Gavey, C.B.; Mr. John Lee, Traffic Manager, Post Office Telegraphs; Mr. W. M. Mordey; Mr. A. M. Ogilvie, C.B., Third Secretary, G.P.O.; Mr. W. Slingo, Engineer-in-Chief, G.P.O.; and Mr. A. B. Walkley, Assistant Secretary, G.P.O.

A Paper by Mr. W. Duddell, published in the *Journal of the Institution of Electrical Engineers*, discusses the most suitable shape for the plates of variable condensers of the rotating sector type in order to ensure that the capacity is proportional to the square of the angle between the systems of plates, which is the most convenient law for practical purposes in wireless telegraphy.

At a special meeting of the Blackburn Chamber of Commerce Telephone Advisory Committee last week, Mr. A. M. J. Ogilvie, G.P.O., stated that a sum of £400,000 is to be spent upon telephone extensions in Lancashire in the near future. An automatic telephone system is to be installed in Accrington very shortly.

**Local Government Board's Sanction for Loans.**—The Council of the I.M.E.A. at its last meeting had under its consideration a communication from the British Electric and Allied Manufacturers' Association, wherein it was pointed out that cases had occurred where local authorities had requested contractors to accept contracts subject to the sanction of the Local Government Board being obtained to the necessary loan, and had requested the contractors to proceed with the work prior to the receipt of such sanction. The I.M.E.A. have agreed with the B.E.A.M.A. that such procedure imposes an unfair liability upon contractors, unless the local authority in question undertakes to recompense the contractor for any "work" so carried out at their request in the event of the contract not being entered into ultimately. The Councils of the respective Associations have therefore agreed that their members should be advised to act in conformity with the foregoing arrangement.

**Ignition of Gas from Signal Wires.**—A series of experiments were made at the beginning of last month at the rescue station of the New Tredegar Collieries, in the Rhymney Valley, by Mr. R. Nelson (H.M. Electrical Inspector of Mines), in the presence of a number of mining and electrical experts, which proved beyond doubt that it is possible for gas to be ignited by sparks produced by the contact of signal wires as used in mines. The gas used in the experiments was obtained from the Cymmer Pit by a blower.

**I.M.E.A. Bill.**—The Incorporated Municipal Electrical Association has been in communication with all the Councils represented in its membership with a view to getting them to secure the support of their Members of Parliament in connection with the Association's Bill next session. The object is to secure a favourable place in the ballot for private members' Bills.

**City and Guilds of London Institute.**—The Institute has now returned to Gresham College, Basinghall Street, E.C., which will in future be the address of its head office.

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

### COLLIERY ELECTRICAL EQUIPMENT

A PAPER by Mr. J. F. Aust, entitled, "Practical Notes on Colliery Electrical Equipment," was discussed on Saturday at a meeting of the Warwickshire and South Staffordshire branch of the Association of Mining Electrical Engineers. It has also been discussed by some of the other branches. Among the more important items to be considered, said the author, are the shaft signals, which should undoubtedly be electrical. At an inset where the coal-winding is done a main and spare tapper should be mounted, and a guard plate fitted to prevent a signal being accidentally given. A simple

FIG. 1.—RELIABLE SIGNAL-  
LING ARRANGEMENT.

FIG. 2.—SATISFACTORY CON-  
NECTION FOR LAMP.

and reliable system is shown in Fig. 1. An efficient method of carrying the wires down the shaft is to thread the insulated wires through screwed steel tubes. The wires are pulled down as each tube is screwed on, care being taken never to screw the tubes up so as to twist the wires. The tubes are secured to the brickwork by means of crampets driven in at suitable intervals. It is of vital importance that all current-carrying parts of electrical signals should be thoroughly insulated so as to prevent stray current from any source whatever energising the bells or relays. The earth should never be used as a return for shaft signals. Great care should also be taken in giving or receiving telephone messages relative to switching power on or off. The cost of generating one B.O.T. unit by Leclanché cells has been calculated at 25s. From this it can be calculated that the cost of battery power for signalling would be approximately 3d. per 10,000 raps; that is, allowing one second per rap. A good light at the pit-bottom and along main haulage roads is very neces-

FIG. 3.—CABLE CLAMP FOR  
SHAFT.

FIG. 4.—ARRANGEMENT FOR  
TESTING ARMATURES.

sary. Where the lighting is done from power circuits, bulk-head and well-glass fittings, hermetically sealed and protected by wire guards, and connected five in series on 500 volts, make a satisfactory arrangement. An instance of how some very fine coal dust was fired, owing to a wire having been pulled out from a lamp-holder, is as follows:—The lamps were wired two in series on 500 volts; the bare end of the wire touching the inside of the iron pipe caused a spark to blow out from the open end, which, falling upon an accumulation of coal dust, caused it to smoulder until a three-inch plank was nearly burnt through. No trouble of any description has been experienced by fixing lamps to girders as in Fig. 2. The lamps are supplied with current by double-armoured wire, and the armouring used for the purpose of earthing the lamp

fittings. An efficient means of carrying cables down a pit shaft is by means of concrete blocks, as shown in Fig. 3. The wooden blocks are 9 in. by 12 in., and the fixing bolts are spaced 4 in. apart. It is a far less bulky arrangement than most methods; the cable, being sustained every 10 yds., carries its own weight, reducing the strain on the armouring to a minimum. If the drum of cable is paid out with adequate precautions from the descending cage and cleated up, the possibility of a "birdcage" forming on the cable is avoided. In regard to dynamos and motors, the author urged that it is far more important to see that the machines installed are fit for the work they have to do than to pay excessive attention to efficiency. A small microphone arrangement for detecting short-circuits or open-circuits in the armature is shown in Fig. 4. The selector is placed on four adjacent commutator segments, and should there be a short- or open-circuit under the microphone selector points, it will remain quite silent. Should, however, the coil under test be all right, a loud rapping sound will be heard corresponding to the make and break of the induction coil.

### THE SENGHENYDD COLLIERY DISASTER

THE coroner's inquest on the victims of the explosion which occurred in the Universal Pit, Senghenydd, South Wales, on October 14th last, was concluded on January 14th, after a hearing lasting eight days; and the jury, in finding that the deaths were due to accidental causes, expressed the opinion that there was insufficient evidence to state clearly the place where the explosion originated, but there was a preponderance of evidence to enable them to fix the lamp-station as the probable starting point. They were unable to say whether the gas was ignited by a spark from the electric wire, but the evidence pointed to the naked light at the lamp station as the cause of ignition.

During the evidence it was brought out that bare signal wires were used in the pit, and one witness stated that sometimes he signalled by applying a file to the wire. If he had no file, he would bring two wires together with his fingers. The file gave a clearer ring. He had never seen a spark or a flash when using a file.

The Home Office inquiry conducted by Prof. R. A. S. Rodmayne, H.M. Chief Inspector of Mines, commenced on January 2nd, but was adjourned on the following day to avoid clashing with the inquest. Evidence was also taken on the question of the bare signal wires, but the manager denied having ever seen sparks from them. The inspector took the view that such an unprotected signalling system was a breach of the regulations, and quoted the following regulation:—

"In any part of the mine in which an inflammable gas, although not normally present, is likely to occur in a quantity sufficiently large to be indicative of danger, the following additional requirements should be observed: All signalling wires and signalling instruments shall be constructed, installed, protected, and maintained so that in normal working there shall be no risk of open sparking."

The manager admitted that the bare wire system was in use at the spot where a fall and blower took place four or five years ago, except that the bell was protected, but said that he was putting in a system which would do away with the electrical apparatus.

The inquiry was resumed on January 27th, when reference was made to an accident reported by Dr. Atkinson, Divisional Inspector for South Wales, at a Welsh colliery, where a fatal fire-damp explosion was believed to have been caused by sparking from an electric signalling bell. It had afterwards been proved experimentally that such sparks could cause ignition of gas. On these grounds, it was announced, the Home Office asked for a strict observance of the special rule. The inquiry was continued on Friday last, and after some argument the Commissioner held that the Home Office had no power to grant exemptions to collieries respecting the obligation to instal a telephone service. At Saturday's sitting the Commission protested against inferences from the experiments at the New Tredegar Colliery being published, as the matter was still *sub judice*. The inquiry will be resumed to-day.

**ELECTRICAL MINING AND METALLURGICAL  
PATENTS OF JANUARY**

THE following patents made public during January are of particular interest to mining electrical engineers. No. 29,774, of 1912, by the British Insulated & Helsby Cables, Ltd., and R. W. Blades, deals with "gate end boxes" for high or low pressure systems. By the construction described, a hinged catch is adapted to engage with the fuse-box cover, and another works with a removable box connected with a detachable conductor. Both catches are worked simultaneously by the switch handle outside the box, so that a complete interlock is effected. They are locked and released by two other catches, from which they may be disengaged by the box cover. The main terminals may be in a chamber separate from the fuse chamber, and the cover may be locked and released only from within the fuse chamber.

The two following specifications relate to miners' electric safety lamps. No. 6,408, of 1913, is by P. Wolf (Friemann & Wolf Ges., Zwickau, Saxony), and relates to a construction for preventing ignition of gas by sparking during switching. To this end a rotary switch plate is arranged to co-operate with the battery terminals, so that a resistance is placed in the circuit during switching. A main contact and an auxiliary contact are connected in line on the plate through the resistance. No. 16,058, of 1913, by F. Faerber (Dortmund, Germany), describes an arrangement in which the bulb is pressed by a spring against a second spring or the wall of the casing, so that when the glass casing breaks, the bulb is shifted and short-circuits the current through the first spring. The temperature of the filament is so reduced that ignition of gas cannot occur. A fuse is arranged in circuit, so that immediately after the short-circuit the circuit is broken.

Below are notes on the more important patents published during January, having particular bearing on the electro-metallurgical industry. Specification No. 2,718, of 1913, by F. C. Wardale and J. Marchant (Rashcliffe Brass and Iron Works, Huddersfield), describes the combination with an electric furnace provided with a vacuum casing of an alumina tapping tube extending through the furnace linings and their metal container to the base of the hearth. A carbon tube

surrounds that part of the tapping tube which passes through the linings. This is temporarily put into circuit during pouring to keep the tube from getting clogged. A vent hole is provided which has either a valve or was designed to fuse at a given temperature and put the vacuum space round the furnace and tapping tube into communication. Specification No. 9,381, of 1913, by P. Eyermann (Witkowitz, Austria), describes a tilting furnace in which the vessel containing the bath is mounted in the tilting frame, so that it can be turned, and electrodes pass both through the cover, base, or sides. The tilting frame may be kept stationary, and the hearth and cover rotated in the same or opposite directions at any speed. The centre line of the electrodes is eccentric to that of the hearth. In specification No. 27,147, of 1912, G. Tischenko and H. Plauson (St. Petersburg) claim a process for manufacturing steel or iron in which electrolytically refined iron is melted and pure hydrocarbons in the form of gas or vapour are sucked or forced through the molten mass. In specification No. 27,968, of 1912, G. H. Benjamin (New York) claims a process for refining carbon and phosphorus, which consists in heating the impure iron with excess of lime, in the absence of oxidising substances, in an electric furnace. Carbon is added to the ore with the lime, so that the oxide is completely reduced. All the carbon is removed, together with the phosphorus, by the excess of lime present. To make iron alloys, the refined iron is transferred from the first furnace to one at a lower temperature, where the ingredients are added. Acid or alkali compounds may be added to act as catalysts. In specification No. 2,484, of 1913, Società Anonima Italiana Gio. Ansaldo & Co. (Genoa, Italy) describes a process for treating steel ingots or castings so as to prevent piping. To effect this the ingot or casting is placed within an A.C. solenoid wound in sections, so that the induced currents allow the metal to cool gradually from the bottom to the top, the current in the various sections being gradually switched off. To prepare pure metals or alloys according to specification No. 27,643, of 1913, by A. P. Strohmeier (Westminster), an arc is passed between two or more rods separated by an infusible material to form a slag. The metal of the rods melts and falls into a heated crucible, and the impurities pass off as vapour. It is said that a homogeneous high-grade steel can be thus produced.

**Electrical Mining Fatalities.**—An inquest was held on January 19th into the death of C. W. Walker, a banksman at the Digby Colliery, Nottinghamshire, whose hand appears to have come into contact with an overhead live wire while he was engaged in tipping coal down the screens. The deceased's father is reported to have complained previously about the state of the wire in question. The inquest was adjourned in order that the Home Office might be communicated with, but was resumed on January 27th, when the electrician gave evidence as to the state of the lighting installation. This was arranged for 110 volts, and one of the transformers had apparently failed, so that 500 volts had been found on the line when tested after the accident. He believed that deceased had come in contact with a bare place on the wire. It was stated that the installation was being overhauled, so that there was no connection between the 110-volt lighting circuits and the 500-volt power circuit, and Mr. R. Nelson, H.M. Electrical Inspector of Mines, who was present, was satisfied that the arrangement now made would remove the possibility of any such accident in the future. The jury returned a verdict of accidental death.

The inquest into the death of G. O. Randle at Exhall Colliery, Warwickshire, referred to on p. 4 of ELECTRICAL ENGINEERING of January 1st, has been concluded. The deceased was splicing a cable which was made alive by the boys who were in charge of the haulage motor, owing to some mistake in the signals. The jury returned a verdict of "Accidental Death," and expressed the opinion that the motor boys were not properly instructed, and were not proper persons to be in charge of the switch. They suggested that instructions be given to the electrician to take the handle out of the switch when repairs were being carried out.

**Association of Mining Electrical Engineers.**—A meeting of the London Branch of the Association of Mining Electrical Engineers will be held on February 6th at the Institution of Electrical Engineers, at 8 o'clock. A Paper will be read on "Electric Safety Lamps" by Mr. F. J. Turquand, and there will be a complete exhibition of various types of lamps now in use. A Paper will also be read by Mr. W. J. Wroe (manager of Tilmanstone Colliery) describing the electrical pumping plant installed at that colliery.

**The Mining Institute of Scotland.**—The second annual dinner of this Institute will be held at the North British Station Hotel, Edinburgh, on February 14th, at 4.45. Tickets, price 6s., can be obtained from Mr. G. L. Kerr, Secretary, 39 Elmbank Crescent, Glasgow.

## A THREE-PHASE SWITCHBOARD FOR ATBASAR COPPER FIELDS

THE Edison & Swan United Electric Light Co., Ltd., have recently designed and constructed a three-phase main

are also used to feed some D.C. power circuits. There are six A.C. feeder circuits and a number of D.C. power and lighting circuits. The generator panels are fitted with "Ediswan" three-phase oil switches, with free operation handles and automatic reverse release. This release is of the inductive relay type, and can be adjusted to operate

"EDISWAN" THREE-PHASE SWITCHBOARD FOR THE ATBASAR COPPER FIELDS.

switchboard for the Atbasar copper fields, to the order of the Power Gas Corporation. The general arrangement of the switchgear is shown in the illustration. The board controls four 250-kw. three-phase 600-volt generators, with two separately driven 750-kw. 100-volt exciters. These exciters

either as a reverse current or reverse power relay, or both. The exciter panels are fitted with "Ediswan" "W" type D.C. circuit breakers for overload only, as it is not intended that these machines shall be run in parallel under normal conditions of working.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 83. —

### THE OSRAM AXIAL LAMP.

THE General Electric Co., Ltd. (87 Queen Victoria Street, E.C.), are putting on the market a special form of Osram drawn-wire lamp, designed to give maximum light in the

shown in Fig. 2, closely fitting the upper half of the bulb, and held in position by a brass ring. This lamp is, of course, not intended to supersede the ordinary Osram lamp for general lighting, but will be found extremely useful where a strong light is required over a comparatively restricted area.

FIG. 1.—LAMP WITHOUT REFLECTOR.

FIG. 2.—LAMP WITH REFLECTOR.

Curves showing Light Distribution of 30 Watt. 25 c.p. Osram Lamps:—

— Osram Standard Lamp without Reflector.  
— Osram Axial Lamp without Reflector.  
— Osram Axial Lamp with Reflector.

FIG. 3.—LIGHT DISTRIBUTION CURVES.

downward direction. As will be seen from Fig. 1, the filament is almost at right angles to the axis of the lamp. The effect is intensified by the use of an opal reflector, as

and where it is not desirable to use large shades or reflectors, such as over office desks, over special tools in workshops, for billiard-table lighting, for manufacturing jewellers and

watchmakers, for shop-window lighting, and for staircases, corridors, &c. A curve showing the distribution of the light is given in Fig. 3. A 30-watt lamp gives nearly 50 c.p. in the axial direction. The lamps are made in the 30 and 60-watt sizes for both high and low voltage; and as there is only one standard size of bulb, the reflectors are interchangeable.

### THE "DOWNLITE" LAMP

THE Edison & Swan United Electric Light Co., Ltd., are placing on the market a new form of reflector lamp, which is illustrated in Fig. 1. It is made with a separate reflector, which is easily attached and secured by an adjustable sleeve, making it a perfect fit, so that the lamp can be used at

FIG. 1.—EDISWAN "DOWNLITE" LAMP.

any angle, as may be required for concentration of light. The polar curve given in Fig. 2 shows the increased downward candle power (approximately 75 per cent.) obtained with the use of the opal reflector. Whilst this increased light is obtainable just where it is required, there is still a sufficiency of light emitted in the upward direction to give reasonable illumination in all parts of the area to be lighted. This

FIG. 2.—CURVE SHOWING DISTRIBUTION OF CANDLE-POWER.

increased downward candle power is partly obtained by the arrangement of the filament, which is in a horizontal plane in one continuous length of grid form, and spirals. The filament is made of drawn tungsten wire, and is well supported to prevent sagging. The Royal Ediswan "Downlite" lamp is especially suitable for interior shop-window lighting, studios, draughtsmen's desks, and offices. It will also be a boon to the householder for its extra downward light for sewing, ironing, reading, &c.

### A "HALF-WATT" LAMP FITTING

IN their price list of Mazda "half-watt" lamps, published on January 12th, the British Thomson-Houston Co., Ltd. (77 Upper Thames Street, E.C.), described six special fittings for these lamps. Since the publication of the above-mentioned price list they have put another semi-indirect "half-watt" fitting on the market. This fitting—the B.T.-H.

"Lumino," illustrated herewith—has been designed to comply with the demand for an inexpensive yet effective semi-indirect unit, which can be used anywhere, independently of the condition, or even existence of a ceiling. The top reflector is made of metal with a white vitreous enamelled reflecting surface, and the under reflector of opalescent glass. The fitting will take a single "half-watt" lamp of any size,

THE B.T.-H. "LUMINO" FITTING FOR "HALF-WATT" LAMPS.

and is supplied complete with Goliath E.S. holder. "Half-watt" lamps in the fitting, which act as excellent distributors and diffusers of the light, are particularly suitable for interior lighting of shops, factories, &c. The brilliance of the "half-watt" lamp renders it necessary that, for interior lighting, it should be screened from sight by fairly dense glassware. The opalescent bottom reflector employed in the B.T.-H. "Lumino" fitting is sufficiently dense to diffuse the light in an agreeable manner, without reducing the efficiency of the unit to any extent.

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**G.E.C. PROGRESS SHEETS.**—The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), has again resumed publication of its progress sheets, which was discontinued about three years ago. The first of the new series, as will the subsequent editions, relates to the four-volume catalogue set issued in April, 1912. The progress sheets will be issued quarterly in future, and new bound catalogues about once every three years. In order to admit of ready reference to the progress sheets in conjunction with the bound catalogue set, a reference mark is given at the top of each page or part of a page indicating to which volume and to which section the contents apply, whilst in similar manner the pages are sub-divided and a reference given in each division, showing to which actual page of the bound catalogue set the revisions or additions apply. An important point is that each quarterly progress sheet will contain a revised and complete alphabetical index which will cancel the previous one. Thus it can be seen at once whether any additions or revisions have been made to those in the bound catalogue set, and, if so, reference is also made to the progress sheet. In use, the whole publication may be filed in the binder provided with the bound catalogue set, or else the corrections made in the progress sheets may be carried over on to the bound volumes, and only the additions and the index filed. In addition, the Company is still issuing supplementary publications, such as leaflets, pamphlets, specification sheets, &c., which are of more limited interest, and some of the specialised items are not to be found in the bound catalogues. The system evolved is found to be very convenient.

**WATER HEATERS.**—A leaflet from G. Wilkinson (Beech Mount, Harrogate) gives detailed instructions for connecting up automatic electric water heaters of the "Losles" type.

A METAL wall block calendar bearing a coloured representation of the company's hunting picture, "Sure of a Good Run," has been sent us by Pirelli, Ltd. (144 Queen Victoria Street, E.C.).

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Accrington.**—A loan of £33,500 is to be applied for in connection with new plant.

**Ballyconnell.**—The local electric light and power company invite tenders for horizontal suction gas-engine plant; 180-kw. dynamo, storage battery, switchboard, &c. Secretary, February 14th.

**Croydon.**—Twelve months' supply of house fuse cut-outs, service boxes, meters, &c. Borough Electrical Engineer, February 16th.

**Colne.**—A self-regulating booster is required at an estimated cost of £200.

**Dundalk.**—New generating plant will shortly be required by the Council.

**Eastbourne.**—The alterations to the mains system, referred to in our Local Notes column, will involve the laying of one or two high-pressure feeders from the works to the town, the construction of two new sub-stations, and switchboard extensions.

**Haslingden.**—The following new plant is required:—Mains (£3,700); transformer, switchgear, &c. (£2,000); services (£1,500).

**Hornsey.**—Twelve months' supply of meters, cables, stores, &c. Borough Electrical Engineer, February 23rd.

**Ipswich.**—Paper-insulated cables for continuous-current and A.C. three-phase systems; also disconnecting and service boxes for 4-core L.T. three-phase A.C. supply. Borough Electrical Engineer, February 21st. (See advertisement on another page.)

**Leigh.**—Messrs. Courtauld & Co. are to erect a new silk mill containing 300 electrically-driven looms.

**London: Shoreditch.**—Tenders are invited for E.H.T. and L.T. switchgear. (See advertisement on another page.)

**St. George's-in-the-East.**—10-h.p. motor for the workhouse laundry, Raine Street, E. February 12th.

**Magherafelt (Ireland).**—The Market Trustees invite tenders for an electric lighting plant for the town. The Trustees offer to take shares in the undertaking. Secretary.

**Melbourne.**—20,000-volt and 1,500-volt underground cables and accessories in connection with the electrification of the suburban railways. Consulting Engineers, Messrs. Merz & McLellan, 32 Victoria Street, S.W. March 5th. (See advertisement on another page.)

**Peterborough.**—A loan of £2,850 for electricity works purposes is to be applied for.

**Portuguese West Africa.**—H.M. Consul at Loanda reports a probable market for electrical machinery, &c., in connection with the concession recently granted for electricity supply. The name and address of the concessionaire may be obtained at 73 Basinghall Street, E.C.

**Rhondda.**—Twelve months' supply of meters. Consulting Engineers, R. Hammond & Son, 64 Victoria Street, S.W., February 17th.

**Stockton-on-Tees.**—Twelve months' supply of various stores. Borough Electrical Engineer, February 18th. (See advertisement on another page.)

**Taunton.**—A L.G.B. inquiry was held last week concerning a loan of £4,950 for new generating plant. There was no opposition.

**Wrexham.**—Twelve months' supply of various stores. Borough Electrical Engineer, February 28th. (See advertisement on another page.)

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aberdare.**—The architect, Mr. T. Roderick, has reported in favour of installing electricity in the industrial school. The plant will include laundry equipment.

**Beckenham.**—New school. Education Committee.

**Blyth.**—New workshops and stores for the Harbour Commissioners.

**Bristol.**—The Corporation has decided to consider the question of substituting electricity for gas in all the elementary schools and other buildings under its control.

**Cork.**—New premises at Buckingham Place, George's Quay,

for T. R. Holland & Co. Architect, J. F. M'Mullen, 30 South Mall, Cork.

**Coventry.**—Artisans' dwellings (£40,000).

**Hounslow.**—New school. Council Surveyor.

**Hull.**—Secondary school for girls, Cottingham Road. City Architect, February 19th.

**London.**—The Metropolitan Water Board is to erect new headquarters in Rosebery Avenue.

**Manchester.**—Rebuilding Golden Cross Hotel, Patricroft.

**Mossley.**—Livingstone Council School.

**Portsmouth.**—Extensions to isolation hospital.

**Rochdale.**—Two new mills are to be erected. Architect, Mr. S. Stott, Oldham.

**St. Austell.**—New infirmary. Architect, E. C. Andrew.

**Stafford.**—Cinematograph theatre. Architects, Nagington & Shennan, 35 Dale Street, Liverpool.

**West Ham.**—Knox Road Special School. Education Committee, 95 The Grove, Stratford, E.

**Worthing.**—Cinematograph theatre.

### Miscellaneous

**Australia.**—The N.S.W. Railways Department requires twenty-four direct-current motor starters. Copies of the specification may be seen at 73 Basinghall Street, E.C.

**Burnley.**—Tramway extensions estimated to cost £26,730, together with twelve cars costing £10,800, are recommended.

**Manchester.**—Twelve months' supply of various stores for Tramways Department. General Manager. February 17th. (See advertisement on another page.)

## TENDERS RECEIVED AND ACCEPTED

**Bolton.**—In connection with the new electricity works, the following tenders have been accepted, subject to the L.G.B.'s sanction to the necessary loans:—Coal-handling plant, weighers' and suction ash-handling plant, Babcock & Wilcox; capstans, Crompton & Co. A tender of the Credenda Conduits Co. has been accepted for a supply of electrical tubes and fittings.

**London: L.C.C.**—In December the Council accepted the tender of T. W. Ratcliff & Co. for electric lighting at the Hammersmith Trade Schol for Girls, at £365 10s. The contractors, however, have been compelled to withdraw, owing to an error, and the Council has accepted the explanation offered. The tender of Messrs. A. Hawkins & Son at £444 has now been accepted for the work.

**Shanghai.**—The General Electric Co., through its Chinese Company, the General Electric Co. of China, has secured for the third time the contract for Osram traction lamps from the Shanghai Tramways (International Settlement).

**York.**—A contract has been placed with Messrs. Chamberlain & Hookham for meters above 10 amperes, prepayment and two-rate meters, and Venner time switches.

## APPOINTMENTS AND PERSONAL NOTES

Mr. H. Hoggart, Installation Inspector in the Blackpool Corporation Electricity Department, is entering the Testing Department of the South Lancashire Power Co. He has been presented with a gold watch by the Blackpool staff.

Mr. J. Dawson, who has been in charge of the Electric Lighting Department of Messrs. J. Blaikie & Sons, of Aberdeen, for sixteen years, has taken up the post of Electrical Engineer to the Duke of Richmond and Gordon, from whose power station the town of Fochabers is supplied.

The Birmingham Corporation is to be asked to approve, among other increases of salaries of its officials, an increase in that of the City Electrical Engineer, Mr. R. A. Chattock, from £1,200 to £1,500 per annum.

Mr. T. A. Taylor, Mains Superintendent in the Hammer-smith Electricity Department, has obtained a similar appointment at Sunderland. A successor is to be appointed at a salary of £150, rising to £175.

Junior assistant electrical engineer required by an electric supply company in the Far East. (See advertisement on another page.)

Cost and rental clerks are required for a telephone company abroad. (See advertisement on another page.)

Premium pupil is required in the Ipswich Municipal Electric Supply Department. (See advertisement on another page.)

## LOCAL NOTES

**Aberdeen: New Plant.**—A new 3,000-kw. turbo-alternator was started up last week.

**Bexhill: Street Lighting.**—The old arc lamps have now been replaced entirely by pairs of 200-c.p. metal filament lamps on brackets projecting from the original standards, about 6 ft. nearer the ground than the arc lamps.

**Blackrock: Electricity Supply.**—Although the Council has more or less been working in conjunction with the Alliance & Dublin Consumers Gas Co. with regard to the latter's provisional order for this district, it has been decided to lodge a petition against the Bill in order to ensure the insertion of certain agreed clauses with the Company. Judging from a discussion at a special meeting of the Council last week, it would seem that certain provisions in the Bill do not altogether coincide with provisions in the agreement.

**Canada: Electrical Developments.**—The President of the Canadian General Electric Co. recently expressed the opinion that considerable electrical developments may be looked for in Canada, particularly in connection with railway electrification.

**Dundalk: Electricity Accounts.**—The Borough Electrical Engineer in his first report upon the working of the Council's electricity undertaking, states that for the ten months to March 31st, 1913, there was a deficit of £162, after meeting all capital charges.

**Eastbourne: The Electric Supply Failure.**—With reference to the breakdowns on the two high-tension feeders at Christmas time, Mr. J. K. Brydges, the Borough Electrical Engineer, will shortly present to the Electricity Committee a detailed estimate of the cost of making certain alterations to the feeders, distributing mains, and sub-stations, which, in the event of any recurrence of a similar trouble, will considerably reduce the inconvenience. The scheme will consist of dividing up the present system of ring mains into smaller sections, not more than two or three of each being controlled by a separate feeder. As a recognition of the work done by the staff at the time of the breakdown, the Assistant Electrical Engineer and men employed on the job have been presented with small money grants.

**Hebden Bridge: New Plant.**—A 220-kw. crude oil-engine-driven dynamo set, manufactured by Messrs. Willans & Robinson (Phoenix dynamo) has just been put into operation. The total cost was £3,250.

**Holmfirth: Electricity Supply.**—A Local Government Board inquiry was held last week concerning an application for sanction to a loan of £7,500 for the electricity undertaking. When the Council obtained its provisional order last year, the intention was to take a supply in bulk from the Yorkshire Electric Power Co., but the negotiations fell through, and although an effort was made to obtain a supply from the Huddersfield Corporation this also came to nothing. Consequently the Council decided to erect a generating plant of its own, and acting under the advice of Mr. A. B. Mountain, the Borough Electrical Engineer at Huddersfield, a scheme has been drawn up, and a tender by Messrs. T. W. Broadbent & Co. at £4,675 has been provisionally accepted. There was some opposition ostensibly on behalf of the ratepayers, but really, we fancy, on behalf of the Gas Company.

**Ilford: Electricity Tariffs.**—We have been favoured with a copy of the various tariffs of the Electricity Department, which number no less than ten, whilst special rates are quoted for arc lamps and high candle-power lanterns, as

well as for special purposes, such as cinematographs, electric vehicle charging, &c. Lighting tariffs include the rateable value charge of 12½ per cent. per annum and ½d. per unit for all current consumed; a tariff for shops, warehouses, workshops, or business premises, from 8½d. per unit, with a discount according to the quantity taken; a maximum demand rate of 6d. and 1d.; and a prepayment meter rate of 4d. per unit. For power there is the maximum demand rate of 2d. and 1d., or a sliding scale from 2d. to 1d., according to the quantity, whilst for a minimum consumption of 10,000 units per quarter current for power purposes is supplied at 1d. per unit. All current supplied for heating and cooking through a separate meter is charged at 1d.

**Ipswich: Electric Vehicles.**—Mr. F. Ayton, the Borough Electrical Engineer, is doing all he can to push the development of electric vehicles in Ipswich. Following up a general publicity campaign in the town, there has been a demonstration by a 10-cwt. Edison delivery van and a two-seater Edison run-about. These vehicles were in the town from January 21st to January 28th, and as a result there is every anticipation that a number of firms will shortly become purchasers. Whilst the vehicles were in Ipswich, the Electricity Department housed them, supplied energy for charging, and provided attendance and cleaning free of charge.

**London: L.C.C.: County of London Co.'s Bill.**—The London County Council has decided to petition against the Bill of the County of London Electric Supply Co. This does not, however, necessarily mean that the Council is opposed to the principle of the Bill.

**Southampton: Position of Electricity Undertaking.**—After a long debate, the Council negatived a recommendation of the Electricity Committee—carried by the casting vote of the Chairman—that the Borough Treasurer should report upon the financial position of the electricity undertaking. There is a very strong controversy going on in Southampton with regard to the views of the Chairman of the Electricity Committee and Mr. H. F. Street, the Borough Electrical Engineer, as to the wisdom of the financial policy upon which the undertaking is run, especially in relation to the selling of current at 0.5d. per unit. Eventually a resolution was carried by a large majority that the President of the Institute of Chartered Accountants and the President of the I.M.E.A. be each asked to nominate a gentleman to report jointly upon the undertaking.

**Sunderland: Street Lighting.**—The Electricity Committee recommends the Council to reduce the charge for street incandescent lamps from 49s. to 46s. per lamp per annum, thus bringing this form of street lighting on equal terms with the charge made by the Gas Company.

**Wood Green: Electricity Supply.**—The Tottenham District Light, Heat & Power Co., to whom the Wood Green electric lighting Order was transferred last session, is taking active steps to erect its power station. The plans for the buildings are now before the local authority, and orders have been placed for the more important items of plant. It is hoped to be able to give a supply by midsummer.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night was £68 to £68 10s. (Last week, £67 5s. to £67 10s.)

**Dissolution of Partnership.**—The partnership between Frederick Thompson and Hans Ochsenbein, under the style of Thompson & Co., 15 and 16 Garlick Hill, E.C., Electrical and Mechanical Engineers and Commission Agents, has been dissolved as from December 31st, 1913, by mutual consent. Debts will be received and paid by Mr. H. Ochsenbein, who will continue trading at the above address under the title of The General Cable Manufacturing Co., for electric wires and cables, and Jeumont Copper Works, for drawn copper wires, commutator segments, &c. Mr. F. Thompson will trade at 48 Watling Street, E.C., as Thompson & Co., being London agent for Yorkshire Cable Co., Ltd., and British agent for the Rex meters.

**Victoria Falls & Transvaal Power Co.**—An issue of £650,000 5½ per cent. second mortgage debentures, Series B, is being made at 92.

## SUMMARY

THE London Central Station employees have decided not to co-operate with the Electrical Trades Union, but have asked the supply undertakings to appoint a Committee to discuss the question of their conditions of working and rates of pay. Steps are already being taken by the Borough Council Engineers to obtain a list of the designations of the various grades of workers and their salaries, and it is therefore not unlikely that effect will be given to this request. The wiremen's wages are being considered by the London Electrical Masters' Association.—The Manchester branch of the Association of Electric Station Engineers is supporting the Weekly Rest Day Bill, and has passed a resolution against the adoption of the Anti-Strike Bill of the North Metropolitan Electric Supply Co. (Page 87.)

WE review the present position with regard to the London Electricity Supply Bill, which will come up for consideration in the present Parliamentary Session. (Page 88.)

THE speeches at the Annual Dinner of the Institution of Electrical Engineers last Thursday were short, and an early adjournment was made for the less formal "reunion" of members. (Page 88.)

A NEW 10,000-h.p. turbo-generator has just been inaugurated in the Neepsend Station of the Sheffield Electric Supply Department, and further extensions are in hand which will accommodate plant aggregating 40,000 to 50,000 kw. (Page 89.)

A PURE fine amorphous variety of tungsten, suitable for the production of ductile tungsten by sintering

under pressure, has been patented by C. Gladitz. (Page 89.)

THE protection of the end windings of electrical machinery from damage due to high initial voltage on switching is discussed in our "Questions and Answers" columns. (Page 90.)

THE use by the Post Office of a device to make an automatic clear for the purpose of eliminating the delay between a telephone subscriber's hanging up and the clearing of the cords by the operator, was among the suggestions made by Mr. W. Aitken in a recent I.E.E. Paper.—Watch and clock makers and others will be pleased to learn that, as a result of Mr. F. Hope-Jones's campaign, the Post Office has abandoned its proposal to charge an annual royalty for the use of apparatus for the reception of international wireless time signals. The fee of one guinea charged for the issue of a licence has, however, still to be paid.—Professor J. A. Fleming's experimental method of producing vibrations in strings is further described. (Page 91.)

A PATENT by A. H. Howard relating to the manufacture of bituminous conduits expires during the week after a full life. The right to the grant of a patent for the cold drawing of tungsten has been surrendered by Pope's Electric Lamp Co. The specifications published by the Patent Office last Thursday include two relating to the "Moore tube" lighting in the name of Moore-Licht A.G., and one by Siemens Bros. & Co. for a method of fusing tungsten in a variety of arc furnace. (Page 92.)

DR. NIETHAMMER suggests that if mercury vapour rectifiers are ever used for traction, they will be of large size and situated in sub-stations supplied with three-phase current.—The purchase price of the Colne and Trawden Light Railway Co. has been fixed at £92,830.—Owing to difficulties in obtaining a supply of power, the Willesden-Earl's Court section of the L. & N.W. Railway will not be working by March 1st, as had been anticipated. (Page 93.)

WE describe in our Trade Section a metal filament lamp for use where concentration of light in the axial direction is desirable, an ingenious automatic apparatus for photographic copying by mercury vapour lamps, and a new ceiling rose combined with switch. A new pattern of electrically driven fan is also illustrated, and further articles deal with a new 150-watt size of metal filament lamp, some fittings for half-watt lamps, an electric heater, and a recent arc lighting installation. (Pages 93 to 96.)

LARGE extension schemes are contemplated at St. Pancras, Rochdale, and Stretford.—Turbo-generators are required at Burton-on-Trent and Nuneaton; mains extensions at West Hartlepool.—Various stores are required by a large number of generating stations.—Three electrically operated coal trucks are required at Southend; and a traction switchboard at Salford. (Page 97.)

THE Edinburgh Electric Light Committee has been advised that it cannot utilise the reserve fund for meeting capital charges.—The possibility of the Brighton Corporation taking over the Hove electric lighting undertaking is again suggested.—The Dublin Electricity Committee is averse from taking off the 10 per cent. increase in prices introduced a year or two ago.—A £6,000 electric bakery has been opened at Burton-on-Trent.—The charges for large power contracts at Kingston have been under criticism. (Page 98.)

THE Yorkshire Electric Power Company's net profit for 1913 was £15,401, against £7,361 in the previous year. (Page 98.)

### ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, FEBRUARY 12TH.

*Institution of Electrical Engineers.*

8 p.m. "Some Railway Conditions Governing Electrification," by Roger T. Smith.

FRIDAY, FEBRUARY 13TH.

*Institution of Electrical Engineers: Newcastle Section.*

7 p.m. At Hugh Bell School, Middlesbrough. "Some Notes on Recent Turbine Design," by M. G. S. Swallow.

*Royal Institution.*

9 p.m. Evening Discourse by Prof. J. Norman Collie, F.R.S., on "Production of Neon and Helium by Electric Discharge."

SATURDAY, FEBRUARY 14TH.

*Royal Institution.*

3 p.m. Afternoon Lecture I., on "The Electric Emissivity of Matter," by Dr. J. H. Harker, F.R.S.

*Finsbury Technical College Old Students' Association.*

6.30 p.m. Annual Dance at Caxton Hall, Westminster.

*Institution of Electrical Engineers: Scottish Section.*

7.30 p.m. Annual Smoking Concert at "Grosvenor," Gordon Street, Glasgow.

MONDAY, FEBRUARY 16TH.

*Institution of Electrical Engineers: Western Section.*

5.30 p.m. At Institute of South Wales Engineers, Park Place, Cardiff. "British Practice in the Construction of High Tension Overhead Transmission Lines," by B. Welbourn.

*Institution of Electrical Engineers: Newcastle Students' Section.*

7.30 p.m. At Armstrong College. "The Design of Static Substations," by W. Dixon.

*Electro-Harmonic Society.*

8 p.m. Concert (Ladies' Night) at Holborn Restaurant.

TUESDAY, FEBRUARY 17TH.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal School of Technology. "The Electrical Driving of Rolling Mills," by N. J. Cursetjee.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. At 207 Bath Street, Glasgow. "Some Railway Conditions Governing Electrification," by Roger T. Smith.

*Illuminating Engineering Society.*

8 p.m. At Royal Society of Arts. Discussion on "The Lighting of Picture Galleries and Art Studios," to be opened by Prof. Silvanus P. Thompson, F.R.S.

WEDNESDAY, FEBRUARY 18TH.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. At Victoria Embankment. "Illumination in Theory and Practice," by W. H. Date.

*"Dynamicals."*

7.30 p.m. Dinner at Trocadero.

### The London Electrical Engineers.

(TO-DAY) THURSDAY, FEB. 12TH.—C. Company. Technical Instruction 7 to 10 p.m.

FRIDAY, FEB. 13TH.—D. Company. Technical Instruction, 7 to 9.30 p.m. Special Instruction on Crossley Engine, 7 to 8 p.m.

SATURDAY, FEB. 14TH.—Headquarters open from 10 a.m. till noon.

MONDAY, FEB. 16TH.—A. Company. Technical Instruction, 7 to 10 p.m.

TUESDAY, FEB. 17TH.—B. Company. Technical Instruction, 7 to 10 p.m.

WEDNESDAY, FEB. 18TH.—Recruits only. Infantry Drill and Technical Instruction, 7 to 10 p.m. Rating Examinations are held every Wednesday from 6.30 p.m.

THURSDAY, FEB. 19TH.—C. Company. Technical Instruction, 7 to 10 p.m.

FRIDAY, FEB. 20TH.—D. Company. Technical Instruction, 7 to 10 p.m.

SATURDAY, FEB. 21ST.—Headquarters open from 10 a.m. till 12 noon.

**Steam Consumption Guarantees.**—A note in yesterday's *Times Engineering Supplement* reads as follows:—"Following the comments in this column on the demand of British steam turbine makers for a marginal allowance of 10 per cent. on their consumption guarantee figures before the plant could be rejected, it is understood that for the present it is proposed to revert to the former 2½ per cent. arrangement. This figure is sufficient to cover errors of instruments and other possible uncontrollable variations, and it has the advantage of checking any tendency to speculative guarantees." We have been unable to obtain confirmation of this statement, and have reason to believe that the matter is still under discussion, and that the statement above is not entirely accurate. The allowance of a 2½ per cent. margin for instrument and personal errors in the tests, of course, constitutes no new departure, and this is probably the allowable divergence asked for before penalties can be enforced. It is probable, however, that a further margin—possibly another 2½ per cent.—will be asked for as the minimum allowance before actual rejection of the plant can ensue. In any case, our readers may take it that the 10 per cent. margin before rejection is to be abandoned.

**JUNIOR SUB-STATION ATTENDANT** (reading report of a meeting of the A.E.S.E.):—He maintained that industrial evolution was eliminating the middle class, did he? Well, I shan't join the workmen agitators, so I'll have to be a member of the upper classes.

## THE UNREST AMONG ELECTRICAL WORKERS

### There is no Strike

DESPITE statements which have been published to the contrary, there is at present no strike of electrical wiremen. Wiring work is still suspended in some cases in which the entire work on new buildings has been stopped in consequence of the dispute in the building trade, and, according to a statement made to us by the District Secretary of the Electrical Trades Union, some 28 wiremen have been called off or have stopped worked voluntarily at Lyons' new hotel in Glasshouse Street, and 8 or 10 from the Victoria Hotel, where building alterations are in progress, but these are isolated cases, and there is nothing even remotely resembling a general strike.

The new position of the London Electrical Masters' Association has now been more accurately defined. They concern themselves only with the consumers' side of the main house fuses. Mr. W. R. Rawlings has been elected Chairman in succession to Mr. Horace Bowden, and all the central-station representatives have retired from the Association with the exception of a few who do house-wiring work. The Electrical Trades Union have been informed by the Secretary of the Association that the Committee is now engaged in revising the working rules of the Electrical Contractors' Association, issued in 1912, and that it may be possible to send the Union Secretary a copy of the revised rules by the middle of next week, so that they may be discussed at a suitable date to be fixed later.

### The Central Station Men will not co-operate with the Electrical Trades Union

A meeting of the London Section of the Association of Electrical Station Engineers was held on Wednesday last week. About 40 members were present.

The Secretary gave an explanation of his action in seconding the amended resolution which was passed at the meeting convened by the London Electrical Masters' Association at Caxton Hall on January 27th (see ELECTRICAL ENGINEERING of Jan. 29th, p. 59). He said that the notice inviting the central station employees to appoint delegates to attend this meeting was only posted up at comparatively few central stations, and it had been only possible to get tickets for delegates at Poplar, Fulham, Marylebone, and St. Pancras. The Committee of the Association of Electrical Station Engineers had asked him to oppose the resolution put forward by the employers, but as only five delegates from central stations attended, they could do very little by themselves. He therefore got into touch with Mr. Potter, the London District Secretary of the Electrical Trades Union, and seconded the Union amendment (to refer the matter to the Electrical Trades Union and the Association of Electrical Station Engineers) on the ground that the Association was not adequately represented. This amendment had been accepted by the Secretary of the Masters' Association (Mr. L. G. Tate), and had been passed. On receiving formal notification to this effect from Mr. Tate, he had written to ask him whether the Masters' Association regarded itself as representing the employers of the charge engineers, switchboard attendants, sub-station attendants, and mains' assistants engaged in station work, and in reply had been told that Mr. Tate "speaking unofficially" could not see how his Committee could possibly legislate for the employees employed at stations.

The Committee of the A.E.S.E., the speaker continued, had now decided that the Association could not co-operate or amalgamate with the Electrical Trades Union—but, he added, there was nothing to prevent them from working synchronously and taking the present opportunity to endeavour to obtain an improvement in their salaries and status.

It was proposed and seconded that the Secretary's action be endorsed by the Association, and this was carried without opposition.

The following resolution was next proposed and seconded:—

"Owing to the fact that the London Electrical Masters' Association does not appear to represent the Supply Authorities of London and Greater London, this meeting instructs the London Committee of the A.E.S.E. to circularise all Supply Authorities in London asking them to form a committee to discuss with the A.E.S.E. conditions of working, hours of labour, and rates of pay."

The proposal of this resolution, it was announced, had been agreed to by a large majority of the Committee. In moving the resolution, the Secretary said that the salaries of switchboard attendants varied from 12s. 6d. a week (at Southwark) to £3 10s. with the London County Council, and the pay of mains' assistants from 25s. per week to £300 or £400 per annum. There must, of course, be differences in view of the varying degree of importance and responsibility attaching to the work, but a minimum should at any rate be fixed. It had been suggested that definite "demands" should be put forward, but he was in favour of simply asking for a meeting to discuss the question. The resolution was duly seconded.

The next speaker expressed the decided opinion that the Association was not strong enough to take the action proposed,

and opposed the resolution on the ground that it would for that reason be harmful to the Association to press it.

He was followed by two members who thought that the request was not put forward in strong enough terms. The first of these said that they were not even asking for a rise, but merely asking the employers to discuss the question of a rise; and the second, who took pride in being a Socialist, and was a member both of the Association and the Electrical Trades Union, maintained that to approach the employers in an amicable way would be merely a waste of time. They should, he maintained, drop their notions about status and profession, and recognise that industrial evolution was eliminating the middle class.

Another point was then raised by a member, who said that the Committee must give the members more information, so that they could gauge their strength. What was the percentage of central station employees in London who were members of the Association? One of the previous speakers immediately objected to this information being given, as the Press were present; but it was pointed out that the figures had already been published by ELECTRICAL ENGINEERING (Jan. 29th, p. 59). The total membership, including about 250 applications which were awaiting consideration, was roughly 1,500, and of these over 400 were London members out of a total of about 700 men in London who were eligible for membership.

This gave a new direction to the discussion, and the Socialist speaker said that with this proportion of members they should be prepared to take a more forcible attitude than had been suggested; the E.T.U., who were only organised to the extent of 40 per cent., were ready to come out on strike. He was sure that the employers would not give serious consideration to a request in the terms of the resolution before the meeting, and advocated a more aggressive attitude.

An amendment was thereupon proposed that the Association should co-operate with the Electrical Trades Union. The Chairman explained that this would be contrary to the views of the Committee, and it was further pointed out that a sub-committee had been formed to receive delegates from the E.T.U. to hear their views. The amendment was then withdrawn by the proposer, but the member with the extreme Socialist views insisted on putting forward a similar amendment, which, however, found no seconder.

Another amendment, that the words "some time next week" be added to the resolution, was passed by 20 votes to 16, and when put as a substantive motion was passed by 21 votes to 12.

After the vote, however, it was pointed out that the employers would be certain not to accede to the demand to appoint a Committee to meet representatives of the Association within a week—in fact, in the case of the municipal employers, it would be impossible to do this if the matter would have to go before the Borough Councils. A short discussion ensued, and the resolution was then rescinded, and the following substituted:—

"Owing to the fact that the London Electrical Masters' Association does not appear to represent the supply authorities of London and Greater London, this meeting instructs the London Committee of the A.E.S.E. to circularise all supply authorities asking them to form a Committee to discuss with the A.E.S.E. conditions of working, hours of labour, and rates of pay on March 2nd, or other convenient date."

This was adopted, and the meeting shortly after adjourned.

To give effect to the above resolution, a letter was sent on Monday to all the electricity supply authorities and companies of Greater London requesting them to consider the advisability of forming a committee to discuss with the Association of Electrical Station Engineers conditions of working, hours of labour, and rates of pay of the following grades employed in the generating, transforming, and distribution of electricity, viz., charge engineers, mains engineers and assistants, switchboard attendants, sub-station charge engineers and assistants, and others on the technical staff. The letter, which is temperately worded, explains that the suggestion is made with the hope that early steps will be taken to discuss these matters, indicates March 2nd as a convenient date for this, and concludes with the expression of opinion that much good would result to the electrical supply industry generally if there existed a medium through which all questions between the supply authorities and their employees could be impartially and carefully considered and the various grades defined.

As this letter was only received on Tuesday morning, it has not yet received definite consideration, but we understand that the Hon. Secretary of the Associated Municipal Engineers (Greater London) has replied to it on behalf of the municipal undertakings, saying that it will be placed before the Association at the earliest possible moment. Probably a special meeting will be called at an early date.

In the meantime, the above-mentioned association of Metropolitan Borough Council engineers had already decided that they were competent to deal with the matter, at any rate in the first instance, and a complete list of the designations given to the various grades of employees and the salaries paid is being obtained, so that the whole matter may be considered on a proper basis. The Associated Municipal Engineers (Greater London) are also, we understand, endeavouring to ascertain whether the supply companies desire to act with them and to form a joint committee.

### Meeting in Manchester

A monthly general meeting of the Manchester Branch of the A.E.S.E. was held last Thursday evening at the Merchants' Hotel, Manchester. Mr. Townley, in the Chair, opened the meeting by drawing the attention of the Branch to the proposed Weekly Rest-day Bill which is shortly to be introduced in Parliament. The clauses in the Bill directly affecting station engineers were read. Special attention was called to that regarding circumstances outside human control as being of great importance to the mains engineer when short circuits occurred on his system on Sundays. Another point emphasised by the Chairman was the fact that the Bill made it compulsory that no three Sundays be worked in succession, even in cases of necessity or emergency. This, he pointed out, left no loophole through which the employer could wriggle. He recommended the Branch to advertise the Bill as much as possible, and suggested each member approaching the M.P. for his division, or anyone having influence or authority, and get them interested in its favour. He asked them to put their shoulders to the wheel and push the Bill for all it was worth to make it a success, for it concerned them very much. Additions to the clauses were suggested by members, so that Local Authorities might have no control over their own employees with regard to Sunday work, and also that they should have no power to grant exemption to power companies. A resolution was passed unanimously by the meeting welcoming the Bill, and proposing the insertion of the additions mentioned.

The meeting then went on to discuss a statement that had been circulated to the effect that the London Branch of the A.E.S.E. had thrown in its lot with the Electrical Trades Union concerning the present trouble in London. This statement had caused a great deal of comment amongst the members of the A.E.S.E. throughout the country, and the Secretary in London had received many letters on the question. A letter was read from Mr. Ebben, the London Secretary, denying the accuracy of the statement, and pointing out that such a step could not be taken without first consulting the whole of the members of the Association.

The North Metropolitan Electric Supply Bill (see ELECTRICAL ENGINEERING, Jan. 8, p. 18) was next discussed by the meeting, and the clause giving the authorities power to fine or imprison any employee leaving the authorities' employ knowing that by so doing his action would hinder the working and continuance of the electrical supply, was condemned by many speakers. They said it would restrict the free action of the worker, and described it as panic legislature. A resolution condemning the insertion of such a clause was passed.

The Secretary then proposed that something be done in the way of dealing with the grievances of members with regard to their employment, and generally to try to better the lot of their colleagues. This evoked a lively discussion, and many suggestions of advertising were put forward, but finally it was decided to empower the Local Branch Secretary to circularise members asking them to inform him whether it was their wish that a sub-committee interview their chief regarding any conditions of employment existing in their station.

The next meeting will be held on Thursday, March 5th, when Mr. W. G. Stokes would read a paper on "Electric Driving as applied to Cotton Spinning."

### THE FUTURE OF LONDON'S ELECTRICITY SUPPLY

SINCE the latest proposals for consolidating electricity supply in London were given definite shape in the form of the Bill which will come before Parliament this session (see ELECTRICAL ENGINEERING, December 18th, p. 715, and December 25th, p. 726), many conflicting reports with regard to the history of the Bill and the attitude taken up by the various supply companies in London have been circulated. Some of these reports have had a basis in fact, others were mere surmise, and the majority of them were an intimate blend of the two. Our readers will therefore welcome a statement of what we believe to be the position at present.

Although the Bill stands in the name of the County of London Electric Supply Co., it is more or less an open secret in City circles that the two banking firms, Messrs. Morgan, Grenfell & Co., and T. Henry Schröder & Co., are interested in it, and that Mr. H. F. Parshall is Consulting Engineer to the scheme. All the thirteen London supply companies have been approached, and we understand that, after they had approved the two main principles of the Bill, viz., postponement of the date of purchase of the Companies' undertakings by the London County Council, and bulk supply, a Committee of the Companies' engineers was formed to go into the details of Mr. Parshall's scheme, and to report upon it. The actual scheme is not set forth in the Bill, but briefly the main points are, linking-up, erection of one or more new riverside bulk-supply stations of very large size, and continuance of some of the existing stations only.

Municipal stations are not included, except in so far as that they can take bulk-supply if they want it.

The reports of opposition to the Bill by any of the companies are not accurate. Some of them have filed petitions "against alteration," so as to be represented in the Committee Room, that is all.

The position of the Borough Councils with regard to the Bill is peculiar. Some considerable doubt exists as to whether they will obtain a *locus standi* to oppose the Bill in Committee. A conference of the Borough Council engineers has been held, at which all except Hammersmith, Marylebone, and Hackney were represented. The unanimous feeling of the members, we understand, was that, as the Bill, if passed, would give the London County Council power to extend the life of one or more companies, difficulties might arise with regard to the grant of loans for extensions to various Borough Councils. Such difficulties, it is known, have already arisen in some cases. The Borough Councils represented at the Conference have resolved to oppose the Bill as far as possible, and, if they cannot get a *locus* in Committee, to take steps to have the Bill opposed on second reading. The Conference also viewed with alarm the possibility of the stations of one or two companies being so enlarged that purchase of them at the end of the companies' term would be a commercial impossibility. Considerable dissatisfaction is also felt with the refusal of the London County Council to call a conference of all the Borough Councils. It is known that Mr. C. H. Merz has prepared a report on the whole question for the L.C.C., but the report has not been communicated to the Borough Councils, and they are still in ignorance as to the attitude which the L.C.C. will adopt towards the County of London Co. Bill.

Hammersmith took independent action last month, before the Conference of the Borough Councils was convened. On January 14th a report of the Law and Parliamentary Committee was adopted by the Council, to the effect that steps should be taken to oppose the Bill and to establish a municipal bulk-supply scheme. Some of the other Borough Councils have strongly resented the endeavour on the part of the L.C.C. to curtail the periods of loans for extensions, a matter which Hammersmith does not consider of such importance, and as the two questions are intimately connected, this may account for Hammersmith not having yet acted in unison with the others. It is by no means unlikely, however, that Hammersmith will bring its opposition to the Bill into line with that of the other Borough Councils. Hackney, we believe, is not likely to take any active part in the fight unless its interests are directly affected. Marylebone has petitioned against the Bill on the ground that it does not consider any scheme satisfactory which does not take account of the whole of the electricity supply system of the metropolis, municipal as well as company.

A definite statement of policy by the London County Council would certainly clear the air.

### INSTITUTION ANNUAL DINNER

THE Annual Dinner of the Institution of Electrical Engineers was held at the Hotel Cecil, London, last Thursday. Sir J. Crichton-Browne, F.R.S., proposed the toast of the evening, in the absence of Lord Moulton. He said that medical men always felt a pride in the progress of electricity, and referred to the number of medical men, from Gilbert and Galvani to Helmholtz, who had contributed towards it. Medical men had always recognised the therapeutic value of electricity, and were freely availing themselves of it. They also came in contact with electricity in connection with the inmates of lunatic asylums, as a large proportion of the insane delusions of these patients had now some reference to electricity. He coupled the toast with the name of the President of the Institution, Mr. W. Duddell, F.R.S., "who looks so young, and is so wise." Mr. Duddell briefly responded, and Dr. S. Z. de Ferranti then proposed the guests. Sir George Askwith, K.C.B., K.C., replied, and said that, at the present moment, in spite of there being several strikes in progress, there were actually fewer than there had been for many months past. Even though there might be some "new importations" coming into this country, there was no immediate trouble in prospect. The President announced that the Italian Association of Electrical Engineers had sent greetings to the Institution, and at 10 o'clock the speeches and formal part of the proceedings were concluded. The members then adjourned to the "Reunion" in the adjoining hall, and conversation was carried on until a late hour.

## ELECTRICITY SUPPLY IN SHEFFIELD

A LARGE gathering assembled at the Neepsend Generating Station of the City of Sheffield Electric Supply Department on Monday, at the invitation of the Chairman and members of the Electric Supply Committee, on the occasion of the starting up by the Lord Mayor of Sheffield (Councillor G. E. Branson) of the fine new 10,000 h.p. turbo-alternator which forms the latest addition to the generating plant. The opportunity was taken to inspect the whole station, which has many points of interest, and a good idea was obtained of the rapid rate at which the load is increasing and the large scale on which things are being done in the way of power supply under the guidance of Mr. S. E. Fedden, City Electrical Engineer, from the fact that, in addition to the 8,500-kw. set just put in, which brings the plant capacity up to 21,500 kw., extensions are already in hand to accommodate another 30,000 to 40,000 kw.

The history of electricity supply in Sheffield dates from the pioneering work of a Mr. John Tasker in 1878, whose little supply business was formed into the Sheffield Electric Light and Power Co. in 1892. A station in Sheaf Street was opened in 1894, and this carried on a supply at 2,000 and 100 volts single phase at the time when the city took over the undertaking in 1898. Soon after, however, the system was changed to 2,000-volt two-phase 50 cycles. By 1902, however, the 3,900-kw. of plant which was all there was room for at Sheaf Street, became insufficient, and in 1904 an entirely new station was opened at Neepsend, between the river Don and the Great Central main line, on the same two-phase system. Two 1,500-kw. Parsons turbo-alternators were first put in, followed by a 4,000-kw. Willans-Dick Kerr set. It is interesting to note, however, that before further extensions were made, it was decided that, although two-phase distribution was to be retained, all further plant was to generate at 11,400 volts three-phase, with inter-connection between the two- and three-phase systems by Scott connected transformers. Accordingly, the next set (known as No. 4) was a 6,000-kw. three-phase turbo-alternator, also a Willans-Dick Kerr combination. The generation has thus been successively on the single-, two-, and three-phase systems.

The newest set (No. 5), which we had met to see inaugurated on Monday, is of still larger size, and consists of a 10,500-h.p. "disc and drum" type turbine manufactured by Willans & Robinson, Ltd. (Rugby), driving an 8,500-kw. 11,400-volt three-phase 50-cycle alternator of the standard type, manufactured by Dick, Kerr & Co. (Preston). Both turbine and alternator are similar in general features to the No. 4 set, and are of types of well-tried and proved reliability. The alternator does not rely on any external ventilating plant, but draws in its own air current and expels it through numerous apertures in the casing. A direct-coupled exciter completes the set. This imposing set is mounted on massive foundations at some height above the main engine-room floor, and stands directly over its condensing plant in the usual way. This was also supplied by Willans & Robinson, and employs a three-throw Edwards type air pump on the same shaft as a separate force pump for lifting the discharge from the hot well to the feed storage tanks. These and the circulating pumps are driven by Fuller two-phase induction motors. The condenser is fitted with a vacuum augmentor attachment. Condensing water is taken from and returned to the River Don.

In connection with the E.H.T. three-phase plant, a very fine new switchboard by A. Reyrolle & Co., Ltd., (Hebburn-on-Tyne) has been installed, providing for generators Nos. 4 and 5 and a number of three-phase feeders, &c. The operating panels are vertical, and are placed in a gallery overlooking the latest extension of the engine room, and the actual high-tension gear is of Messrs. Reyrolle's well-known ironclad draw-out pattern, which has proved so successful in some of the large power distribution schemes in the North and elsewhere. The 11,500-volt oil switches are behind the wall, each backing its own control panel, from which it is mechanically operated. There is ample space behind for drawing out the switch carriages for inspection, and the whole strikes one as a remarkably sound engineering job. Synchroscopes of the rotary type are provided, and the voltage regulation is taken care of by a Tirrill regulator.

This new generating set has naturally entailed additions to the boiler plant, and these take the form of two Stirling water-tube boilers of an evaporative capacity of 38,000 lb. per hour. This brings the total number of Stirling boilers up to eight. The first four were of slightly smaller size. Some

are fitted with Bennis, some with chain-grate, and some with underfeed stokers.

In addition to inspecting the old and new plant within the station, we made quite an extensive tour embracing ground that is now being excavated in connection with the further extensions, which, as we have already intimated, will add from 40,000 to 50,000 kw. to the plant capacity. Something like 30,000 cu. ft. of soil is being removed and some of this is of a nature that can be made into bricks to be used on the contract. Part of this space will be occupied by cooling towers, as the limit is already reached, beyond which it is not advisable to rely only on returning the condensing water to the river. Beyond this ground is a large area occupied by open-air coal storage sufficient to accommodate some 15,000 tons of coal, or a six weeks' supply. Care is taken by vertical perforated wood tubes to ventilate the stacks of coal thoroughly, to avoid danger of spontaneous combustion. The coal is taken from the sidings to this storage ground by an electrically-driven overhead ropeway; another ropeway, capable of carrying 20 tons per hour, deals with the ashes, and as the space where these are now tipped, already holding about 40,000 tons, is nearly full, a further ropeway for their disposal in a different direction is to be installed. The existing coal and ash plant is complete and interesting. The coal arrives at the siding at a high level, some is shot direct into the bunkers feeding the automatic stokers, some into a hopper feeding the ropeway to the storage ground, and the trucks are handled by electric capstans, traversers, &c., while electrically-worked hoists are provided for the ashes, all worked by two-phase motors.

Making our return, via the boiler house, to engine-room extensions, where we were most hospitably entertained by the Electric Supply Committee, we admired the long rows of large Stirling boilers with feed-pump rooms at intervals, and noted the completeness of the measuring arrangements, involving Lea recorders and other apparatus. An interesting item of the plant is a high-speed electrically-driven centrifugal pump, which can be used to pump river water into the feed tanks in event of the town water supply failing, to supply river water for fire service in these conditions, and to obtain river water for use in cleaning the boilers.

We obtained an excellent idea of the rapid way in which the undertaking is growing by seeing the large scale on which extensions are being carried out, and when it is said that the units sold per annum have increased nearly tenfold in the last ten years, and have leapt up from 16,902,360 to 21,671,978 in a single year, one cannot doubt the necessity for these heroic measures.

## THE PREPARATION OF TUNGSTEN FOR DRAWN FILAMENTS

THE preparation of what is held to be a new variety of tungsten suitable for compressing and sintering into bars for the manufacture of ductile tungsten lamp filaments is described in a Specification published by the Patent Office on January 29th. The patentee is C. Gladitz, and the patent is No. 27,859, of December 3rd, 1912.

According to the specification, a variety of pure crystalline tungsten (called "fluffy"), having the appearance of an irregular mass of feathers, is produced from tungsten ore, after purification, by grinding to a fine powder, dissolving in caustic soda or ammonia, filtering, and bringing to a specific gravity of about 1.05. This solution is then allowed to drop into boiling hydrochloric acid at a rate between 1,000 c.c. in 780 secs. and 1,000 c.c. in 900 secs. The acid is kept in constant agitation by means of superheated steam led into it. Tungsten oxide is precipitated in fine fluffy flakes without any colloidal formation. It is then decanted, filtered, and washed in hot water, and dried in a nickel drying chamber at a temperature of 450° C. to 500° C. on aluminium trays. It is then sifted through a sieve of 50,000 meshes per sq. in., and a yellow powder having a volume weight of 1.70 to 1.80 results. This oxide is then reduced in a furnace some three metres long, containing a reducing chamber of pure nickel. It is heated by graduated heat units, so that the temperature gradually increases along its length from 20° C. to 850° C. The temperature then rapidly falls, to prevent re-oxidation, and then decreases slowly for the next two metres. The tungsten oxide is passed through the furnace on aluminium trays at the uniform rate of 11 mm. per min. A plastic, deep black, impalpable powder results, which requires less heat than other varieties to effect sintering in a press mould.

**Obituary.**—The death of Professor Karl Pichelmayer, of Vienna, took place on January 23rd, at the age of 45. Prof. Pichelmayer, whose work in alternating-current machine design is well known, had been professor at the Technische Hochschule, Vienna, since 1905, and was Vice-President of the Austrian Elektrotechnische Verein. He was formerly connected with the Vienna house of the Siemens firms.

# QUESTIONS AND ANSWERS BY PRACTICAL MEN

## RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

## QUESTION No. 1,378.

What are the salient features of the magnetite arc lamp, and why does it not find so much favour in this country as in U.S.A.?—"KINK."

(Replies must be received not later than first post, Thursday, February 19th.)

FIG. 3.

## ANSWERS TO No. 1,376.

In high-tension A.C. motors, trouble is often encountered through the insulation breaking down on the coils nearest the terminals, due to the high initial voltage on switching in. Describe fully arrangements which are used, and have been found satisfactory in practice, whereby this trouble can be overcome. "G. T."

The first award (10s.) is given to "J. E. R. R." for the following reply:—

The trouble instanced in this question is brought about by the end turns of each phase acting as a choker to the rest of the phase winding, thus getting the bulk of the shock. The sudden rise of pressure across a comparatively small number of turns causes the voltage between adjacent turns to get abnormally high, resulting in puncturing and consequent short-circuiting and burning out. Where motors are started up by auto-transformers, the latter usually get the shock, and the puncturing appears on their terminal turns instead of those on the motor. The same trouble occurs on the H.T. end turns of static transformers when they are switched on the line. With motors there are three remedies being adopted. First the end turns can be given extra insulation to withstand voltages many times their normal working value. The number of turns to be given this extra insulation usually ranges from 15 to 20 per cent. of the winding. This is also adopted on transformers, but it is a rather expensive expedient, inasmuch as it upsets the symmetry and standard design of the motor or transformer, thereby increasing labour and material costs, and interfering with the ventilation. With auto-transformers, however, this method is feasible and cheap. It is generally the most reliable method,

and becomes imperative on motors and transformers working on very high voltages not only to protect them from switching, but from surges on the line. A second remedy aims at reducing the current by first putting in series an ohmic resistance previous to switching on the line volts. This is automatically accomplished at the switch by fixing an extra contact, which makes a circuit through the resistance previous to the main contact touching, the resistance being then short-circuited, as shown in Fig. 1. This necessitates the fixing of a special switch, as it is not usually possible to fix such a device to existing apparatus. The resistance, of course, has to be very specially insulated, and must be kept separate from the switch. It is usually mounted on porcelain insulators near the switch, but sometimes in a separate oil tank. It can be made capable of adjustment, so that the resistance can be varied to suit the type and power of the motor controlled. This method, however, is not always successful in doing away with the pressure rises unless a comparatively large resistance is put in, and then trouble may arise at the switch. The third, a far more effective method, consists in substituting a choker for the resistance. This has been found to be a cheap and reliable method, and has got rid of many breakdown troubles on H.T.A.C. motors in the writer's experience, especially on pit motors. It is, of course, necessary to fit a choker in each phase, and it is inserted automatically by the switch as shown in Fig. 1. Various designs of chokers are used. Some makers use a coil of copper strip wound in a spiral and mounted on porcelain insulators without iron core. Others use one iron core for all three-phase coils. The ordinary three-limb type of choker is the simplest and most reliable, and as each coil is quite separate, it can be insulated in such a manner as to withstand very abnormal pressure rises. It can be oil immersed if desired, but it must be remembered that its use is only momentary, and quite incapable of much heating. Special

attention must be paid to the insulation of these coils, as it is obvious that they will get exactly the same shock, electrically and mechanically, that the motor coils previously had to meet. Special precautions are needed at the switch so that the length of the blades and contacts allow a short time interval to elapse between first connecting the supply and finally short-circuiting the choker. Mr. Duddell gives the time interval as being 1/10,000 of a second. Quite a special design of switch is needed with three extra contacts brought through the case. It is possible to obtain the same effect by using two switches in duplicate, one to switch in motor with chokers in series, and the other to short-circuit the chokers, the latter being so interlocked with the former that it comes into action a definite time after the first has closed. When using auto-transformers, the whole trouble can be overcome by designing the transformer with specially insulated and rigidly clamped coil. It then forms a starter and choker combined.

The second award (5s.) is given to "J. P. S." who writes as follows.

The information given in the question points to a trouble termed "Front Voltage." It will be found that when this occurs, the breakdown will be between the first few turns at the beginning of each phase, and not to earth. There is also a trouble caused by "Ozone," but this is quite different to the above. There is a tendency to assume that pressures of from 3,000 to 10,000 volts are not dangerous to windings, but this is a mistake, because brush discharges take place between the insulated wires and the mica insulated troughs in the slots, and "Ozone" is produced; this very rapidly destroys the cotton insulation, burns it, and causes short circuits between wire

and wire. The only practical remedy against these defects is to expel the air contained in the winding completely, so that all the wires are embedded in a solid insulator. There is also the inductive action produced by lightning discharges, which are undoubtedly phenomena of high frequency. It has been known that whenever windings have been damaged by atmospheric discharges, it is always at the first few turns at the beginning of the phases that the damage takes place, and that usually the puncture is between turns, and not between wires and frame. This proves that the discharge was unable to penetrate deeply into the winding, and that very considerable potential differences are produced between adjacent wires. This is characteristic of high-frequency effect. From the above it will be seen that one cannot depend upon the cotton insulation which separates the turns, because this insulation is only intended for a few volts. Some manufacturers insulate the first few turns of each phase heavier than the rest of the windings, but there is a limit to this, owing to slot space. The writer believes in making the ends of H.T. stator coils as round as possible, and to avoid sharp corners, because, when a H.T. current is switched on to a wire that has any bends in it, it has a straightening-out effect on the wire. A very effective method is to connect up an "Ohmic" resistance in series with each phase on the oil switch, so that the contacts from the resistance have a lead, thus making and breaking the circuit through the resistance, as shown in Fig. 2. The idea is to cut the pressure down at the instant of switching off and on. Another method is to connect up in shunt to the beginning of each phase and, say, the fourth turn, an adjustable spark-gap and resistance in series, and adjust the gap so that the normal voltage across the turns will not bridge the gap, but the high inductive e.m.f. in switching will. The resistance, being in series, prevents any rush of current. Fig. 3 shows this arrangement.

### ANSWERS TO CORRESPONDENTS

H. P. W.—If you are unwilling to run the machine faster, the only way for you to obtain the somewhat higher voltage desired will be to provide new field windings with more turns. The machine will, however, run hotter, and may not be quite so good from the point of view of sparking.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

It will be interesting to learn whether the "automatic clear," described by Mr. W. Aitken at the Newcastle Section of the Institution of Electrical Engineers last Monday, will be taken up by the Post Office. The device is for the purpose of eliminating the delay which occurs between the subscribers' hanging-up at the close of their conversation and the clearing of the cords by the operator. The relay, which, in the ordinary cord connections, controls the supervisory lamp, is made to control a cut-off relay which disconnects all the connections to the cord when the subscriber hangs up; thus the line lamp is reconnected on to the calling subscriber's line, the line tests idle throughout the multiple, and last, but not least, the junction wire is released. It is doubtful whether the Post Office would adopt this method merely to give subscribers the benefit of having their lines cleared quicker; but if the saving in time between a manual and automatic clear will really conduce to an appreciable gain in the amount of traffic which the junction wires can carry, it may possibly appeal to the Department. A modification of the device for private branch exchanges, which the author described, should certainly have a useful field, if it works out well in practice. Another suggestion made by Mr. Aitken in connection with the automatic clear was that, instead of the supervisory lamps being used as a clearing signal, the connections should be changed so that the converse obtained, i.e., that a glowing lamp should indicate that the cords were in use. This, he points out, would be of great value in assisting the supervisor to observe the operator's load.

We are very pleased to hear that the Post Office has seen fit not to enforce its proposed demand of an annual royalty from users of the "Horphone" and other simple wireless receiving sets adapted for the reception of International wireless time signals. Mr. F. Hope-Jones, who is Chairman of the Wireless Society of London and Managing Director of the Synchronome Co., Ltd., is to be congratulated on the successful result of the arduous fight he has put up on behalf of the National Association of Goldsmiths, the British Horological Institute, the British Science Guild, and others directly interested. The important paragraph in the letter just

received from the Post Office by Mr. Hope-Jones reads: "The Postmaster-General . . . has decided not to require payment of an annual royalty for licences issued in respect of apparatus intended for this purpose [reception of wireless time signals]. The fee of £1 ls., which is charged to cover Office expenses connected with the issue of the licence and the inspection of the installation, will, however, still be payable by applicants for such licences." The earlier stages of the negotiations were dealt with in *ELECTRICAL ENGINEERING* for November 6th, 1913, p. 622, and the *Horphone* was described in *ELECTRICAL ENGINEERING* for July 17th, 1913, p. 421.

The following is a description of the experimental method for the production of vibrations on strings, illustrating the properties of loaded or unloaded telephone cables evolved by Professor J. A. Fleming. It will be remembered the working of the apparatus was shown at the recent exhibition of the Physical Society. The vibrations are produced on a string by attaching one end to the shaft of a small D.C. motor of about  $\frac{1}{2}$  h.p., which has on one end of its shaft a mechanism for counting revolutions, and on the other end a disc which has a crank pin inserted in its outer face, and to this pin is attached a light crankshaft connected at its outer extremity with a rocking lever. The string is fastened to a hook on the crankshaft near to the crank pin. The other end of the string is attached to a fixed point which can be moved by means of a screw, in some cases a spring balance being interposed to measure the tension. When the motor is started the string has a circular motion given to its end which is equivalent to two simple harmonic motions at right angles to each other. If the tension is rightly adjusted the string then vibrates in sections, and the number of sections can be adjusted by altering the tension. The distance from node to node can then easily be measured and the frequency determined from the speed of the motor. In this way the velocity of the wave is measured, and can be compared with the velocity determined by taking the square-root of the quotient of the tension by the linear density of the string. Strings made of flexible cotton cord can be loaded with glass or wooden beads and set in vibration. In this manner it can be shown experimentally that when the wave-length on the string extends over a distance of more than 8 or 10 loads, the string vibrates as if the loading matter were uniformly distributed, but the string cannot propagate vibrations when the half wave-length approaches equality to the distance between two loads. It is also possible to show the reflection of a wave at a load placed at any point on the string, and also that this reflection is reduced by tapering off the loading.

Among the articles in the February issue of the *Marconi-graph* is one dealing with wireless telegraphy in polar exploration, and after a word of regret that Captain Scott was unprovided with any such means of communication, the utility of Dr. Mawson's wireless equipment is referred to; and the fact that Capt. Amundsen is equipping the *Fram* with wireless apparatus, and also providing portable sledge outfits, is mentioned. Illustrations are given of Dr. Mawson's station on Macquarie Island, and at his base in George V. Land, by which the party has been able to keep in touch with the outside world.

The Carcavellos-St. Michael cable was repaired on January 28th, while, on the same date, we have to record the failure of the Zanzibar-Mombasa cable.—The Fort-de-France (Martinique)-Cayenne cable and that between Paramaribo and Cayenne was in working order on the 30th ult.—As from the 1st inst., the rates to Guadeloupe, Martinique, and Marie Galante have been reduced to six francs per word, which equals 4s. 10d. per word.

**Employers and the Trade Disputes Act.**—At a meeting of the Employers' Parliamentary Council held at 25 Victoria Street, Westminster, last week, to consider the grave industrial situation due to the Trade Disputes Act and to the unchecked conspiracy of labour unionism against private freedom and public welfare, arrangements were made to hold a mass meeting of representatives of the Associations of Employers connected with the various industries in the United Kingdom to urge upon the Government the need for an inquiry into the working and the effects of the Act, to determine whether the present unlimited area in which picketing in unlimited numbers may be carried on should not be restricted and the number of pickets regulated by Statute, whether combinations for disorganising trading and social conditions should not be made unlawful, and whether it is not of national interest that all unions should be subjected to the ordinary law of the land, and made responsible, like all other classes, for their actions.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Feb. 5th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

1,069/13. **Loud Speaking Telephone.** R. PECORINI. The instrument is intended for use in vehicles, and comprises a transmitter in a two-part case, enclosing above a contact piece a microphone. This consists of granulated anthracite in a carbon or metal casing, with its edges closed by an asbestos ring. The diaphragm is of carbon. The receiver is also in a two-part case. The bottom part carries a soft iron core and winding of about 0.3 ohms resistance. Five figures.

1,218/13 and 8,712/13. **"Moore Tube" Lighting.** MOORE-LICHT A.-G. To ensure constancy in the light emitted, any impurities in the gas are absorbed or combined chemically by the pulverisation or vapourisation of auxiliary cathodes by the heat of a Geissler tube discharge. According to the second specification, the colour of the light emitted is determined by exciting the tube by superposed currents of particular frequencies. The specifications have four figures and one figure respectively.

10,369/13. **Fusing Tungsten.** SIEMENS BROS. (*Siemens & Halske A.-G.*). The tungsten to be fused is contained in a crucible in an indifferent atmosphere. The crucible has a lining of compressed tungsten. The tungsten to be fused is made the positive pole of an arc furnace, the negative pole also being of tungsten. To prevent bubbles, the tungsten to be fused may have about 1.7 per cent. of thorium added to it.

11,905. **Rotary Converters.** A. H. RAILING and C. C. GARRARD (*G.E. Co.*). The currents which flow in the windings of rotary converters connected to a common A.C. generator or transformer are equalised by means of a differentially wound choke coil. When the currents are equal the device is neutral, but when the balance is upset a P.D. is produced, which tends to restore the current balance. Three figures.

22,018/13. **Reflectors for Advertising Signs.** W. H. G. GWYNN and H. E. CLERK. The reflector is curved, has a clear front surface, then a coloured transparent layer, and behind a reflecting surface. The light is placed so that the angle of incidence of the light from the front of the lamp is less than the angle of total reflection. Four figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** SIEMENS DYNAMO WORKS, LYDALL and DUKE [Motor control systems] 1,591/13; BITTER and WEISSBERG [Insulators for H.P. oil-immersed apparatus] 7,656/13; RAILING and GARRARD [Operating rotary converters, &c.] 10,841/13.

**Dynamos, Motors and Transformers:** ROLFE [Turbo-generators] 23,689/12; HIORTH [Induction coils] 22,159/13.

**Ignition:** KETTERING [Starting] 7,543/13; POGNON [Sparking plugs] 28,267/13.

**Incandescent Lamps:** ROUX and SANCHEZ [Filament supports] 1,442/13; KANAZAWA [Filament containing cobalt] 16,481/13.

**Switchgear, Fuses and Fittings:** MIDDLEMISS [Dimmers] 1,467/13; SWAN [Rheostats for motor controllers] 6,226/13; DELVENNE [Automatic motor-starter and brake] 11,135/13; OTIS ELEVATOR Co. (*Otis Elevator Co., U.S.A.*) [Motor controllers] 15,571/13; YOUNG [Fuses] 27,641/13.

**Telephony and Telegraphy:** WESTERN ELEC. Co. (*Western Elec. Co., U.S.A.*) [Telephone exchanges] 1,902/13 and 16,267/13; TORIKATA, YOKOYAMA and KITAMURA [Dischargers for wireless] 1,939/13; DICKINSON [Closing and disinfecting telephone mouthpieces] 2,198/13; BARTON and ROBERT W. BLACKWELL & Co. [Lattice masts for wireless aerials, transmission lines, &c.] 3,829/13; STERRY [Telephone call registers] 7,376/13; Soc. DES TÉLÉGRAPHES MULTIPLEX (SYSTÈME MAGUNNA) [Conversion of direct into isochronous undulatory currents] 14,122/13; TOBIASEN [Masts] 22,639/13; PARRA [Fixing cables and wires to insulators] 26,600/13; BARONIO and WOOD [Tape perforators] 29,389/13.

**Traction:** BLACKALL and JACOBS [Token apparatus] 23,417/12; KENNEDY [Signalling where speed restrictions prevail] 1,964/13.

**Miscellaneous:** WESTERN ELEC. Co. (*Western Elec. Co., U.S.A.*) [Winding machines] 1,617/13; HUNT and LEAKEY [Automatic lock for lift-well gates] 6,963/13; KERSCHBAUM [Metal vapour lamp] 11,991/13; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Stable boron nitride] 12,377/13; BUHLMANN [Illuminated advertisements] 16,474/13; STOCKS [Ship's telegraphs] 21,758/13; A.E.G.

[Discharge tube with incandescent cathode and enclosed vapour forming body] 22,816/13; FRIEDR. KRUPP A.G. [Destroying residual magnetism] 28,715/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** MORRISON [Power transmission] 5,793/13.

**Electrometallurgy and Electrochemistry:** FRIEDR. KRUPP A.G. [Automatic stirrer for electrolytic baths] 742/14.

**Ignition:** NEUFELDT and KUHNKE [Magneto with multipolar rotary field magnet] 12,956/13.

**Incandescent Lamps:** WESTINGHOUSE METALFADEN GLUHLAMPEN-FABRIK, 540/14.

**Instruments and Meters:** HARTMANN & BRAUN A.G. [Simultaneously recording several currents] 27,348/13.

**Storage Batteries:** SVENSKA ÅKKUMULATOR AKTIEBOLAGET JUNGNER [Alkaline accumulator electrodes] 38/14; [Restoring activity of positive electrodes] 72/14; [Manufacture of a mass of the higher oxygen compounds of metal for use in positive electrodes] 1,062/14.

**Switchgear, Fuses and Fittings:** MORRISON [Circuit controller] 5,792/13; FRIEDR. KRUPP A.-G. [Automatic pressure regulators] 28,898/13; A.E.G. [Time switch] 1,176/14; FINCATO [Current regulators] 1,238/14.

**Miscellaneous:** GIRARDELLI [Remote control of guns] 198/14 and 452/14; MASCARINI [Application of the electric properties of metallic sulphides to electro-technics] 590/14.

The following Amended Specification may now be obtained:—

**Telegraphy:** F. JAMIESON [Selective wireless calling up] 19,014/12.

### Opposition to Patent Withdrawn

18,654/12. **Electric Clocks.** C. H. DAVIES. The opposition to the grant on this application has been surrendered. The patent relates to a motor attachment driving a worm gear wheel to drive a spring.

### Right to Grant of Patent Surrendered

22,548/12. **Drawn Tungsten Filaments.** POPE'S ELECTRIC LAMP Co. (*C. Trenzen, Germany*). The right to the grant of a Patent on this application has been surrendered. The specification describes the cold drawing of tungsten alloyed with thorium.

### Application for Restoration of Lapsed Patent

9,537/08. **Conduit Continuity Fittings.** C. VAUGHAN and C. BIRCH (*Jas. Birch & Sons, Walsall*) have made application for the restoration of this Patent, which was allowed to lapse on May 2nd, 1912, owing to the non-payment of the renewal fee. The fittings have sockets cast on, and these are tapped to take a small screw.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

2,964 of Feb. 14th, 1900. **Manufacture of Conduits.** A. H. HOWARD. A wire helix or interlaced wires are placed in a tube or mould together with asphalt or a bituminous composition. The mould is then rotated so that the asphalt is splayed outwards by centrifugal force, and forms with the wires a lining to the mould. When the latter is removed a conduit tube or fitting results.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** H. BECK [Iron rings are placed a little above the arc in converging carbon lamps] 22,511/04; M. RAILING, M. SOLOMON and H. E. CROCKER [Flame arc carbons] 23,116/07.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** SIEMENS BROS. (*Siemens & Halske*) [The motor of a winding set is worked from a dynamo driven by several small motors with flywheels] 22,572/03; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Electrolytic lightning arresters] 22,135/08.

**Storage Batteries:** S. LAKE [Submarine equipment] 23,151/02. **Switches, Fuses and Fittings:** HENLEY'S TELEGRAPH WORKS and W. H. NICHOLS [Iron-clad fuse boxes] 21,648/05; E. GAR-SIDE [Motor controllers] 22,228/08.

**Miscellaneous:** J. H. GOEHST [Illuminated signs] 21,293/01; C. A. H. BULLOCK and P. G. E. DANIEL [Machine for supplying postage stamps, &c.] 23,205/07 and 23,251/07.

## ELECTRIC TRACTION NOTES

Some particulars are given in the *A.E.G. Journal* of the locomotives used on the recently opened extensions to the Rhaetian Railway, including the line from St. Moritz to Schuls, and the branch from Samaden to Pontresina. The line, which is of metre gauge, is worked with single-phase current at 10,000-11,000 volts at the contact line, 16 $\frac{2}{3}$  cycles. The locomotive has two fixed and two movable coupling axles and two Bissel bogie trucks. There are two motors, each giving 350 h.p. on the one-hour rating. They drive a shaft through duplicate spur gearing with teeth set at an angle. The gearing shaft drives a jackshaft, situated between the second and third pairs of coupled wheels, through coupling rods set at an angle. The control contactors are operated at 300 volts. Provision is made for taking 100 kw. from the main transformer for heating. Two pantagraph collectors are used. It is said that during the first three months' running 8,500 miles have been covered without any appreciable defects occurring. A train of 180 tons can be started on a gradient of 1 in 40 and attain a speed of 17.4 m.p.h. in 52 secs. The maximum speed attained is 28 m.p.h.

Dr. Niethammer, reporting in *Elektrotechnik u. Maschinenbau* on the progress of electric traction in the United States, writes that the General Electric Co. recently supplied one of the 80-ton direct-current locomotives for the Butte Anaconda Railway with direct-current at 2,400 volts from a 1,000-kw. mercury-vapour rectifier. The rectifier was supplied with three-phase current at 60 cycles, thus giving an almost uniform direct-current. The current from a single-phase rectifier is of a pulsating nature and would necessitate special motor construction. If mercury-vapour rectifiers are ever used for traction work they will probably be large units in substations supplied with three-phase current of any

periodicity, as if placed on the locomotive a double overhead conductor would be required for the three-phase supply.

The Colne Corporation is to take over the Colne & Trawden Light Railway Co., at £92,830. This price has been fixed by Mr. A. J. Ram, K.C., who acted as arbitrator. The Light Railway Co. asked £170,000, whilst the Corporation offered £27,000.

The negotiations for the supply of power to the Earl's Court, Addison Road, and Willesden High Level section of the electrified line of the London & North Western Railway have fallen through. The service which it was hoped to begin on this section by March 1st is not now possible. The Railway Co.'s generating station at Stonebridge Park will, however, be working by the end of the year.

**The Association of Consulting Engineers.**—The inaugural dinner of this Association was held at the Whitehall Club, Princes Street, Westminster, on Monday, February 2nd, with Mr. G. Midgley Taylor in the chair. About 90 members and guests were present. The toast of the Association was proposed by Mr. J. H. Balfour-Browne, K.C., who referred to the useful work that was before them in keeping up the standard of the profession. The chairman, in responding, said that they sought in no way to usurp the functions of other and more technical bodies, but their main object was the better protection both of consulting engineers and of the general public. Mr. H. P. Boulnois proposed the guests, and Mr. C. E. C. Browne, President of the Society of Parliamentary Agents, and Mr. A. Bruce Anderson responded. Mr. J. Swinburne, in proposing the health of the Hon. Secretary and the Hon. Treasurer expressed his appreciation of the work done in the formation of the Society by Mr. Dykes and Mr. Lowcock.

**Transformer Design, Manufacture, and Testing.**—A course of lectures on the design, manufacture, and testing of transformers will be commenced by Mr. F. E. Berry at the City and Guilds (Engineering) College, South Kensington, S.W., on March 5th. For fuller particulars application should be made to the Registrar.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 97. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**HEATING AND COOKING.**—A leaflet has just been issued by Krupka & Jacoby, Ltd. (26 to 36 Chapter Street, Westminster, S.W.), dealing with a make of heating and cooking apparatus for which they are the sole agents in this country. The articles listed include nickel cookers of 1 to 5 pints capacity, warming plates, a range of nickel and brass kettles and tea-pots in various patterns and finishes, flat irons, and a cheap heater for small quantities of water taking only 200 watts. This should prove particularly useful for doctors, dentists, barbers, &c. The irons listed vary in weight from 2 $\frac{1}{2}$  lb. to 8 lb., and may be obtained with different types of handle. One is also provided with a switch, and one of the 2 $\frac{1}{2}$  lb. irons is adapted for running off 100/120 volts or 200/250 volts, and is therefore useful for people who are continually travelling.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**INCANDESCENT LAMPS.**—A catalogue from the Sun Electrical Co., Ltd., deals with Osram, Wotan, Mazda, Ediswan, Auriga, Aegma, Z, Foster, Stearn, and other "conference" makes of tungsten lamps, as well as tantalum, carbon, radiator, tubular, and battery lamps, and special candle lamps, including the "flexalite," "hunalite," "shadoless," and "kingolite" varieties.

**ROLLER BEARINGS.**—The Hoffmann Manufacturing Co., Ltd. (Chelmsford), have now standardised a form of short roller bearing of a type that they have had running with success for over four years, and are issuing a complete descriptive list. These bearings have very high load-carrying capacity for their size, and work which previously called for an excessively large ball bearing can now be dealt with by a roller bearing of practical dimensions. They can run at practically any speed, and are regularly in use on wood-working machinery spindles running at 8,000 to 9,000 r.p.m. For rotary converters, motor

generators, and other electrical machinery, where end thrust is not developed, they should prove invaluable.

**ILLUMINATION.**—An attractive booklet entitled "Industrial Illumination" has just been issued by Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.), containing descriptive particulars and illustrations of various types of material which the firm supply for industrial lighting, including Wotan and tantalum lamps, half-watt lamps, metal and glass reflectors, and several attractive forms of "Alba-lux" and other semi-indirect lighting fittings. A quantity of general information on illumination is given, expressed in a way which should be useful to those contemplating lighting installations. A copy of this booklet will be sent to any of our readers who make application.

**LAMP FITTINGS.**—The latest list to be issued by the Electrical Co., Ltd. (122-4 Charing Cross Road, W.C.), deals with a number of the company's fittings for outdoor semi-indirect and other lighting purposes. Besides robust enamelled iron and other fittings for outdoor lighting generally, including shop-window lighting, a porcelain fitting for chemical factories, &c., is listed. Ceiling and pendant fittings for direct and semi-indirect lighting are available in different designs. The "Goliath" holders and shades for 600- and 1,000-watt lamps occupy a prominent position.

**"MANGANESITE" FOR STEAM JOINTS.**—A little booklet issued by John Hudson and Co.'s Successors (4 Victoria Warehouses, Mansell Street, London, E.) is devoted to a consideration of the application and advantages of "Manganeseite" for making boiler and pipe-work joints steam-tight. The compound or paste may be used even for high pressures and super-heats, and has given satisfaction to British and foreign Government departments, shipping and railway companies, &c. Besides for steam joints, it may be used for water, gas, and air joints. The company will be pleased to send the booklet to anyone interested in this class of work.

**ELECTRIC LIGHT FITTINGS.**—A leaflet from the Edison and Swan United Electric Light Co., Ltd. (Ponder's End, Middlesex), shows some of the new artistic fittings recently produced by it.

A neat, artistic wall calendar has been sent by the Electrical Accessories Supply Stores (9 Queen's Terrace, Miletown, Sheerness).

### THE WOTAN CONCENTRA LAMP

A NEW form of Wotan drawn-wire tungsten lamp of the focussing pattern, giving a maximum illumination in the axial or downward direction, has been put on the market by Siemens Bros. Dynamo Works, Ltd. (Incandescent Lamp and Fittings Department, Tyssen Street, Dalston, N.E.). This is to be known as the Concentra lamp, and will eventually be listed in their general Wotan catalogue. As will be seen

FIG. 1.—CONCENTRA LAMP WITH PLAIN BULB.

FIG. 2.—CONCENTRA LAMP WITH LENS BULB.

from the illustrations, the high illumination below the pip end of the lamp is obtained by the arrangement of the filament conically on a special patented support, the upper portion of which is much wider than the lower. In order to intensify the effect, the lamps are also made with the top half of the bulb opal and the lower half ribbed, as shown in Fig. 2. The distribution of light obtained is shown in Fig. 3, as compared with that of an ordinary

FIG. 3.—CURVES SHOWING DISTRIBUTION OF LIGHT FOR ORDINARY LAMP AND CONCENTRA LAMP WITH OPAL TOP.

Wotan lamp. These lamps are made in the 30, 40, and 60-watt sizes, giving respectively 22, 30, and 48 c.p., with plain or lens bulbs, with or without opal top half, and should be very useful in situations where it is desirable to concentrate the light on to a small surface.

### THE 150-WATT MAZDA LAMP

THE B.T.H. Co. are now listing a new size of Mazda lamp, taking 150 watts, to meet the demand for a lamp intermediate in size between the present 100 and 200-watt lamps. This 150-watt Mazda lamp is made in both 100-130 volt and 200-260 volt ranges, and in either pear-shape (4½ in. diameter, 8 in. overall length), or in round bulb, the same size as the existing 200-watt lamp. The addition of the 150-watt lamp represents a useful extension of the range of Mazda lamps in standard sizes, which has been developed to fulfil the requirements of every lighting condition met with in practice. Readers desiring further information and prices on this new lamp are requested to write to the British Thomson-Houston Co., Ltd., Mazda House, 77 Upper Thames Street, E.C.

**Lundberg Switching Competitions.**—Our readers may remember that in November last a long list of certificate and prize winners in Messrs. Lundberg's Switching Competition of last summer was published in our columns. This list did not include all the Overseas competitors, as a longer time had to be allowed for their papers to reach home. We are informed that the complete list of those who have passed is now as follows:—*Advanced:* W. J. Harris, Royal Engineers' Office, Colombo; H. Keith, Punta Arenas, Chile. *Intermediate:* W. Jude, Antwerp; Drummond Hunter, Wellington, N.Z. *Preliminary:* R. Drilhon, Pau, France; H. H. Morgan, Bermuda; Ardeshir Kaikobai Modi, Bombay.

### A SWITCH-CEILING ROSE

THE illustrations below show a new device which has been placed on the market by the General Accessories Co. (70 Worship Street, Finsbury, E.C.). This will doubtless

Two-thirds size.

FIG. 1.—SHOWING SWITCH-CEILING ROSE CLOSED.

Two-thirds size.

FIG. 2.—SHOWING SWITCH-CEILING ROSE OPEN.

find several useful applications. A key-holder on a pendant almost invariably gives trouble some time or another, owing to the baring of the flex and the jerk given to the lamp when the switch is used. There are many cases where this can be displaced by the switch-ceiling rose illustrated.

### THE RECTIGRAPH

WE had the opportunity last week of inspecting the "rectigraph"—a machine for copying drawings and documents by a rapid photographic process with the aid of Cooper-Hewitt lamps. It is made by the Westinghouse Cooper-Hewitt Co., Ltd. (80 York Road, N.). The document to be copied is placed in a frame under a sheet of glass and lighted by means of two 1,000-c.p. lamps placed on independent telescopic stands. It is then photographed direct on to photographic printing paper within a large camera with fixed focus, and adjustable so as either to make a reproduction to even scale or reduced scale; the setting of the paper, developing, and fixing are all carried out automatically, and the operator has only to turn a few handles in the proper order. The whole process takes less than five minutes, and perfect reproductions are obtained. The machine should be particularly useful for making copies of blue and white prints or of other drawings and documents on thick paper for which the ordinary direct photographic printing process is not applicable.

**A "Wotan" Knife.**—Our thanks are due to Siemens Bros. Dynamo Works, Ltd. (Incandescent Lamp and Fittings Department, Tyssen Street, Dalston, N.E.), for an example of the ingenious puzzle pocket-knives which they are distributing as an advertising novelty among electrical engineers and dealers. They have kindly let us into the secret, but we will not divulge to our readers how the knife is opened and closed.

## A HALF-WATT STREET LIGHTING FITTING

A NEW "half-watt" fitting, employing the B.T.-H. radial-wave reflector, has just been designed by the British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street, E.C.). The radial-wave reflector is made of stamped fluted steel with a reflecting surface of white vitreous enamel. The upper surface is painted green. To accommodate the neck of the Mazda "half-watt" lamp the reflector is fitted with a specially long gallery or housing. The radial-wave reflector fitting can be used with any form of street-lighting post, bracket or cable suspension equipment, and will take any size of Mazda "half-watt" lamp. The characteristics of the radial-wave reflector have been described before, but they

RADIAL-WAVE REFLECTOR FITTING FOR HALF-WATT LAMPS.

may be briefly referred to here. As is well known, the general defect with ordinary reflector equipment for street lighting is that a high intensity of light is given immediately underneath the lamps, while between the posts the illumination is inadequate unless the standards are very closely spaced. This reflector obviates the difficulty by giving a more nearly horizontal direction to the light rays than is possible with a concave reflector. The radial-wave reflector projects the maximum candle-power between the horizontal and an angle of  $80^\circ$  below the horizontal, and thus gives a fairly uniform illumination between the posts when they are correctly spaced. The fittings are supplied complete with special gallery and Goliath E.S. holder.

## FANS AND BLOWERS

WE have received from Simplex Conduits, Ltd. (Garrison Lane, Birmingham), a copy of a new list, which gives particulars of fans and blowers, sewing-machine motors, buffing motors, &c.

The fans cover the usual range of desk, bracket, and port-hole types, having blades from 10 in. to 16 in. in diameter, as well as a range of box blade ventilating fans from 12 in.

SIMPLEX EXHAUST OR BLOWING FAN.

to 6 ft. in diameter, for use in exposed positions. These fans can be fitted with thrust ball-bearings for running with the spindle in vertical position. Motor-generators suitable for accumulator charging, electric blowing, or experimental purposes, are listed in outputs from 50 watts to 250 watts. We illustrate a small self-contained blower for ventilating large rooms, or for the removal of dust, wood shavings, fluff, &c., in factories. These blowers can also be used in smithies.

## ARC LIGHTING IN ST. PANCRAS

THE Borough Council of St. Pancras has recently installed a number of Angold magazine flame lamps in the Euston Road, in place of the old open-type arcs, which had done duty there for so many years. The improvement in the lighting is seen in the two illustrations shown on this page—Fig. 1

FIG. 1.—OLD LIGHTING BY OPEN ARCS.

taken with the old type in use, and Fig. 2 showing the new magazine lamps. In the latter, the excellent diffusion of the light for street-lighting purposes, due to the specially designed globes is very noticeable. The Angold magazine lamps are of 10-amperes capacity, and the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), who were the

FIG. 2.—NEW LIGHTING BY FLAME ARCS.

makers of the new lamp, inform us that whereas the candle-power of the old lamps was about 400 c.p., the new lamps give between 3,000 and 4,000 c.p. with the same expenditure of energy. Similar lamps have also been erected in Tottenham Court Road, Hampstead Road, and Camden Road.

**Mazda House News.**—Under an attractive cover, showing Mazda lamps mounted in Veluria reflectors as church bells against a star-spangled sky, we find the fourth issue of *Mazda House News*, the contents of which, as usual, combine pleasantly the commercial, the humorous, and the technical. The latest information regarding Mazda novelties is given, and there are many excellent illustrations of installations where Mazda lamps are used to their best advantage in combination with the various systems of reflectors in which the company specialises. A special inset deals with Mazda half-watt lamps.

**Central Suspension Lighting.**—Referring to the note on page 71 of our last issue but one, the Electrical Engineering and Equipment Co., Ltd., write that they are also suppliers of central suspension fittings, and that equipments of their manufacture are in extensive use.

## BELLING ELECTRIC FIRES

IN the newest design of Belling fire the radiant bars are arranged on the back surface, which is curved, and in front of the usual aluminium reflector. A ruby lamp is entirely hidden in the scrollwork in front, which is so designed that all the red rays are directed on to the reflecting surface behind the bars, and this light, mingling with that from the glowing elements themselves, presents a particularly cheerful appearance. This design, which, we note, is registered, is known as the "Pedestal."

"PEDESTAL" PATTERN BELLING FIRE.

The switches are conveniently arranged at the top to facilitate easy control. It is 26 in. high and 18 in. wide, and takes 2 kw. on full heat. The finish is in a rich dark bronze. Besides this, the other more popular designs for office and residential heating are listed in a leaflet, arranged for overprinting the names and addresses of supply authorities and contractors, which, together with a small blotting pad, a circular letter, and a large poster illustrating the convenience of Belling fires in the bedroom, are being offered by Belling & Co. (Derby Road, Edmonton, N.) to contractors and supply authorities all over the country. The present time, early spring, is propitious for obtaining converts to electric heating, and among the number of radiators made by Belling & Co. a design suitable for every voltage and position can be found. The capacity of none, except the "Office" pattern, is below 2 kw., so that rapid heating is obtained. There are two degrees of heat, controlled by two switches, on all patterns except the "Office." All the fires in which six heating bars are used can be arranged to take 3 kw. at a slight additional cost. There is, we note, a three years' guarantee in all cases. A useful adjunct to the list is a sheet showing the art porcelain enamel finishes in which the fires can be obtained.

## FIXTURES FOR HALF-WATT LAMPS

"THIRD CITIZEN" HALF-WATT LAMP FITTING.

dozen fittings in which these considerations have been attended to. "Superlux" or "Equilux" glassware is used. The fittings are designed for outside and inside use, and for direct and indirect systems. One of the cheaper fittings, known as the "Third Citizen," is illustrated here, and three other representative examples are shown in the General Electric Co.'s advertisement on another page.

## TUNGSTEN LAMP IMPROVEMENTS

A PAPER by Messrs. W. Harrison and E. J. Edwards, recently read before the American Illuminating Engineering Society, provided a *résumé* of the improvements which have been made in the tungsten lamp since 1908. These relate mainly to increased mechanical strength; better candle-power maintenance, due to the use of chemicals in the bulb; decreased bulb size; and standardisation of lamp dimensions. The introduction of the Mazda drawn-wire lamp in 1911 gave a filament with a strength stated to be 300 per cent. greater than that of the first tungsten lamp. Many people, however, do not realise the extent to which the strength of the drawn-wire filament has been increased since 1911. The British Thomson-Houston Co. tell us that the Mazda filament of to-day is approximately 40 per cent. stronger than in 1911. This is illustrated by the series of transverse tests on filaments made in each year since 1907, plotted as a curve in the figure. The ordinates of this curve are proportional to the distance through which a filament of given dimensions will bend before breaking under the stress of a gradually in-

DIAGRAM SHOWING IMPROVEMENT IN STRENGTH OF MAZDA FILAMENTS.

creasing load. The results show that the present Mazda drawn-wire filament can be deflected between ten and twelve times as much as the pressed filament of 1907 without breaking. In the matter of candle-power maintenance there has been great improvement due to the introduction of a chemical into the bulb, which combines with the black deposit and renders it light in colour, thus reducing the bulb absorption to a marked degree. At the present time all lamps above 40-watt size are supplied with the chemical.

Much time and effort have also been devoted towards decreasing the cost of manufacturing and handling the lamps by reducing the bulb size, upon which the cost of reflectors and accessories is also dependent. Mazda drawn-wire lamps have now been completely standardised in a full range of sizes for all lighting purposes. The most important dimension to be standardised from the illuminating engineer's point of view is the distance between the centre of the light source and the base contact of the lamp. The average deviation from the standard in this dimension is less than one fourth of the average a year ago.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Birkenhead.**—Twelve months' supply of meters, fuse-boxes, &c. Borough Electrical Engineer. February 24th.

**Bolton.**—Twelve months' supply of various stores, including motors, motor starting switches, meters, transformers, &c. Borough Electrical Engineer. February 26th. (See advertisement on another page.)

**Bootle.**—Twelve months' supply of cable, meters, fuse-boxes, and terminals, &c. Borough Electrical Engineer, February 18th.

**Burton-on-Trent.**—A new turbo-generator is required.

**Crook.**—An electric lighting scheme is under consideration. It is probable that supply will be obtained from the Newcastle Electric Supply Co.

**Gateshead.**—Additions to Guardians power plant; a 1,600-yard transmission line; 400 lighting points in the Cottage Homes. Consulting Engineers, Tennant & Barrs, Cathedral Buildings, Dean Street, Newcastle-on-Tyne.

**London: Battersca.**—Twelve months' supply of meters, service-joint boxes, carbon and metal filament lamps, &c. Borough Electrical Engineer. March 3rd. (See advertisement on another page.)

**St. Pancras.**—The scheme of extensions outlined in our issue for January 15th, page 40, has been sanctioned by the Council.

**Nuneaton.**—A 600-kw. D.C. turbo-generator, surface condensing plant, &c. Borough Electrical Engineer. February 21st.

**Rochdale.**—Considerable extensions are contemplated at the Electricity Works.

**Salford.**—Main traction switchboard. Borough Electrical Engineer. March 4th.

**Stretford.**—Extensions of plant are being reported upon.

**Walthamstow.**—Twelve months' supply of motors, arc lamp carbons, &c. Borough Electrical Engineer. February 25th.

**West Hartlepool.**—An expenditure of £2,300 is contemplated on mains.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Blackpool.**—Savoy Hydro. Architects, T. G. Lumb, Son & Walton.

**Bolton.**—New mill. Swan Lane Spinning Co.

**Bury.**—Twenty houses.—Electric lighting installation at hospital. Joint Hospital Board.

**Halifax.**—Lighting of West House. Education Committee. Secretary, 22 Union Street. February 16th.

**Newcastle-under-Lyme.**—New free library. Architects, Biggs, Wolstenholme & Thornely, Liverpool.

**Nottingham.**—A new masonic temple, Chaucer Street, Architects, J. & C. E. Howitt, Bentinck Buildings, Wheeler Gate.

**Rochdale.**—Sanatorium. Town Clerk.

**Swansea.**—New cold stores. Harbour Trustees.

**Tottenham.**—Electric lighting of Central Library. March 3rd. Borough Engineer. (See advertisement on another page.)

**Warrington.**—Baths extensions.

### Miscellaneous

**Bacup.**—Arrangements are being made for the electric lighting of the main streets.

**Bury.**—A special sub-committee has been appointed to consider the question of street electric lighting.

**Chilthorn.**—The Parish Council requires fifty-six 50-c.p. electric lamps for street-lighting purposes.

**Crete.**—Particulars of a concession for the construction of electric tramways in Canea are on file at 73 Basinghall Street, E.C.

**Ilford.**—Twelve months' supply of cables, metal filament lamps, joint boxes, switches, meters, arc-lamp carbons, &c. Borough Electrical Engineer. February 24th. (See advertisement on another page.)

**London: Fulham.**—Twelve months' supply of electrical stores. Clerk to Guardians, 129 Fulham Palace Road.

**St. Pancras.**—Arc-lamp carbons. Borough Electrical Engineer, March 2nd. (See advertisement on another page.)

**Nelson.**—A trolley-omnibus scheme is to be installed at an estimated cost of £6,678.

**Salford.**—Two years' supply of stores, &c. General Manager, February 23rd.

**Southend-on-Sea.**—Three electrically operated coal trucks. Borough Electrical Engineer.

**Swansea.**—Progress is being made with the preliminary investigation as to the electrification of the Mumbles railway.

## TENDERS RECEIVED AND ACCEPTED

**London: London and South Western Railway Co.**—An order has been placed with Messrs. Mitchells, Ashworth, Stansfield & Co., of Old Bailey, for 2,500 "Mascolite" felt pads, one inch thick, for resting cables on when passing across bridges, to protect them from vibration.

**Manchester.**—The following tenders have been accepted:—Cables, Johnson & Phillips; Electrical Engineering & Equipment Co.; C. Macintosh & Co.; India Rubber, Gutta Percha & Telegraph Works Co.; Callender's Cable & Construction Co.; W. T. Henley's Telegraph Works Co.; and Western Electric Co. Converting plant, British Westinghouse Co.; three 53-k.v.a. transformers, Ferranti, Ltd.; paper-insulated cables, W. T. Henley's Telegraph Works Co.; tramcar motors, British Westinghouse Co.; controllers, Dick, Kerr & Co.

**Salford.**—The British Westinghouse Co. have been given an order for two rotary-converters and static transformers.

**Swansea.**—Contracts have been placed with the Electric & Ordnance Accessories Co. for motors, and with Brook, Hirst & Co. for starting switches.

## APPOINTMENTS AND PERSONAL NOTES

It is officially announced that Mr. J. E. Taylor, Superintending Engineer in the Post Office Engineering Department, who was reduced in rank in connection with transactions in shares of Marconi's Wireless Telegraph Co., is to be reinstated in his former position at the next vacancy.

As pointed out in our last issue, the Birmingham Electricity Committee recommended that the salary of Mr. R. A. Chattock, the City Electrical Engineer, be increased from £1,200 to £1,500 from January 1st, 1914. When the proposal came before the Council an amendment was moved that the matter be referred back for further consideration. Later, however, another amendment to increase Mr. Chattock's salary from £1,200 to £1,400 was carried by fifty-seven votes to thirty-five.

Mr. H. J. Hawkins, the Salford Borough Electrical Engineer, is to retire in May, and the Committee has fixed the minimum salary for his successor at £1,000 per annum with annual increments.

The many friends of Mr. S. W. Tucker will be pleased to hear that he has now resumed his duties as head of the Order Department of Messrs. Baxter & Caunter, Ltd., after a severe illness. He desires to thank all those friends who made kind inquiries.

Mr. R. B. Leach, at present Electrical Engineer at Heywood (Lancs.), has been appointed Electrical Engineer to the Portrush U.D.C.

Mr. H. J. Penfold has been appointed junior Charge Engineer in the Dover Electricity Department at a commencing salary of £78 per annum.

The Hackney Electricity Committee recommends that the salary of Mr. E. Mathews, Testing Engineer, be increased from £130 to £180 by annual increments of £10; that of Mr. E. Wilkinson, Generating Engineer, from £117 to £127 10s. per annum; and that of the Electrical Draughtsman, Mr. W. Barham, from £180 to £210 per annum by annual increments of £7 10s.

**FOR  
STEAM JOINTS  
USE**

**JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.**

## LOCAL NOTES

**Aldershot: Electricity Surcharge.**—A short time ago the Local Government Board auditor surcharged a sum of about £15 for expenses incurred by the Borough Electrical Engineer and Chairman of the Electricity Committee in connection with a trip to Belgium to inspect some Diesel engines. The Board, however, has now remitted this surcharge.

**Burton-on-Trent: Electric Bakery.**—The Burton Co-operative Society last week opened some extensions to their electric bakery, which have cost £6,000.

**Chiswick: Electricity Scheme.**—The poll of ratepayers upon the question of whether the Council shall proceed with its Bill for the acquisition of the local electric light undertaking has resulted in an adverse decision, the figures being 950 against the Bill and 416 for the Bill. The number of ratepayers is 8,000, and it will be seen what a very small proportion took the trouble to vote.

**Dover: Bulk Supply.**—Mr. G. F. Metzger, Chief Engineer to the South-East Kent Electric Power Co., has informed the Corporation that it will be necessary for him to complete certain negotiations with the colliery companies in the Dover district before he can quote the Corporation for a bulk supply.

**Dublin: Electricity Supply.**—The net profits from the electricity undertaking for the last financial year were £7,767, compared with £11,870 in the previous twelve months. This falling-off in profits is attributed to the increased price of coal, and the operation of the Shop Hours Act. From time to time requests have been made in the Council that the Electricity Committee should take off the 10 per cent. increase in prices introduced a year or two ago in consequence of the effect of metal filament lamps, but in view of the possibility of even more economical lamps being placed on the market before long the Committee is decidedly against this action. The Committee also urges upon the Council the necessity for building up a reserve fund before profits are transferred to relief of rates. Last year the Council decided to allocate £5,500 to relief of rates against the wish of the Committee, and Counsel's opinion has now been taken to the effect that the Council has no power to do this until the accumulated reserve is sufficient for working capital purposes.

**Eccles: Half-watt Lamps.**—The Electricity Committee has decided to adopt half-watt lamps for street-lighting purposes.

**Edinburgh: Electric Light Surplus.**—We reported in our issue for January 22nd, page 56, that the Town Clerk and City Chamberlain had been asked to report upon the proposition of the Electricity Committee that the reserve fund should be 15 per cent. of the capital expenditure instead of 10 per cent., as at present. This report has now been issued, and it explains that the Corporation's Consulting Engineer has advised that an additional power station will be required within the next few years, the capital expenditure upon which will probably be £125,000. In the years during which the work in connection with this new power station is in progress the ordinary expenditure account of the undertaking will become liable for interest and sinking fund charges in respect of the additional expenditure, and it is in order to be in a position to meet these charges without increasing the present rates for electrical energy that the proposed increase in the reserve fund was suggested. The Town Clerk and City Treasurer, however, point out that under the Corporation's Electric Lighting Order of 1891 the reserve fund is only applicable to meeting deficiencies in revenue where the latter is not equal to the expenditure. In view of this provision they do not think that the proposed increase in the reserve fund could be used for the purpose for which the Committee desire. It is pointed out that the only alternative is to increase the rates of supply; but it is not thought that this would be likely, the opinion being expressed that the natural increase in the revenue of the undertaking will be sufficient to meet the ordinary expenditure, including the extra capital charges during the period up to the date when the expenditure on the new power station becomes remunerative.

**Hove: Electricity Supply.**—The *Sussex Daily News*, for the second time, hints at a strong possibility of an arrangement being come to between the Corporation and the Brighton Corporation for the working of the Hove Electric Supply Undertaking. Our local contemporary suggests that arrangements will be come to in the shape of a "deal" in which Brighton will take over the management of the Hove Electric

Supply undertaking, at the same time agreeing to an abandonment of the through routes of the trolley omnibus system, to which some opposition has been manifested in Hove.

**Kingston-on-Thames: Supply Charges.**—There has been considerable controversy in the Borough with regard to the charges under special contracts for electricity supply. The Works Sub-Committee has now carefully considered this matter at the direction of the Council, and recommends that the existing arrangements and terms be continued. The argument here, as in so many other instances, is that, as these contract prices are something less than the average total cost of production, power is being sold at a loss. This, of course, takes no account of the fact that under these large contracts current is supplied during the hours of non-peak, and that they help very considerably to reduce the standing charges upon the plant which have to be met during this period. An amendment that the matter be again referred back to the Committee was lost by eleven votes to seven, and the Committee's recommendation was eventually carried.

**Redditch: Position of Electricity Undertaking.**—A consulting engineer is to be engaged to report upon the general position of the electricity undertaking.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £68 to £68 10s. (Last week the same.)

**Agency.**—The Victoria Dynamo & Motor Co. (Craven House, Kingsway) have appointed Holmwood Bros., 68 East Street, Bedminster, Bristol, to be their agents for the West of England and South Wales.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Yorkshire Electric Power Co.**—The net profit for the year to Dec. 31st, after meeting mortgage interest, was £15,401, as against £7,361 in the previous twelve months. After including the balance from the previous year and meeting the 6 per cent. preference dividend for 1913, the sum of £5,000 is carried to general reserve, and £4,188 carried forward. The Company's power station at Barugh, where waste gas from coke ovens is used, has given every satisfaction since it was started in October, and there is a considerable increase in the demands in the Barnsley coalfield area. The shareholders are to be asked to approve a further issue of £50,000 six per cent. preference shares.

**Ediswan Smoking Concert.**—The staff and foremen of the Edison and Swan United Electric Light Co., Ltd., Ponder's End, Middlesex, gave their third and last smoking concert of the season on Friday, the 6th, in the Works Café, Ponder's End. There was the usual good attendance of nearly 100 members. Mr. E. P. Barfield presided, supported by Mr. J. E. Cooper, Chief Accountant. Mr. W. Davis, Instrument Foreman, made his usual popular and humorous speech.

## SUMMARY

FROM a statement made at the meeting of the St. James' and Pall Mall Electric Light Co. on Tuesday, it appears that the supply companies are still far from accepting the scheme for the reorganisation of London's electric supply, put forward in connection with the London Electric Supply Bill. (Page 100.)

THE lighting of covered lawn-tennis courts and squash racquet courts is described in a special article. (Page 101.)

THE latest developments in sparking plugs and ignition systems for petrol engines were described by Mr. H. Procter in a recent Paper read before the Rugby Engineering Society. In a new type of lighting generator, pressure regulation is obtained by a lateral movement of the armature and commutator of special construction under the brush system. (Page 102.)

AN electrolytic process for the conversion of cast-iron into a variety of iron having many of the properties of steel is being developed by a London syndicate. (Page 102.)

THE conditions governing railway electrification in this country at the present time were dealt with in a recent I.E.E. Paper by Mr. Roger T. Smith. He advocated the electrification of suburban lines on any system which might show to the best advantage, and, if necessary, the electrification of the main lines later on, on the same or a different system. Mr. H. W. Firth and Mr. J. B. Sparks expressed disagreement with this course in the discussion. The author thought that there were greater possibilities for the electrifica-

tion of heavy goods and mineral services than for fast passenger services. A separately-excited D.C. motor had advantages of high speed working, as the torque did not fall off so rapidly as with the series motor. (Page 103.)

METHODS of compounding alternators are discussed in our Questions and Answers columns. (Page 104.)

DURING the week there will expire, after a full life, two Patents; one deals with curbing on siphon recorders, and is by A. Muirhead, and the other relates to a Westinghouse adjustable electromagnetic track brake. Bertram Thomas seeks restoration of some lapsed patents relating to switchgear, and, it is announced, the Comptroller has allowed the grant of a patent to C. H. Fischer for the manufacture of tungsten suitable for drawn metal filaments. The grant was opposed. Abstracts of patent specifications published by the Patent Office last week are also given in our "Patent Record." (Page 106.)

In a recent Paper on portable wireless telegraph sets for army and aerial work, &c., Mr. P. R. Coursey gave some information as to new sets and systems. A set devised by Mr. Dubilier gives a range of 30 to 40 miles with an expenditure of 75 to 100 watts. A musical note is obtained by regular condenser discharges controlled by a novel system of vibrating contacts.—Inspectors of steamships in American ports have found that, in some cases, the emergency wireless equipment has not been kept in good repair. (Page 105.)

ILLUSTRATED articles in our trade section describe a star-delta drum type starter, new forms of automobile and battery lamps, fittings for half-watt lamps for indirect lighting, and a half-watt lamp installation, new sizes of half-watt lamps that are being introduced are also mentioned. (Pages 107 and 108.)

THE Great Eastern Railway Co. is probably seriously considering the difficult problem of the electrification of its large suburban system, and the experience of the newly-appointed General Manager from the Long Island Railroad, New York, will be valuable in this connection.—A scale drawing of the two sizes of battery charging plug adopted by the Electric Vehicle Association of America is given. (Page 105.)

THE Dundee Corporation complains of what it terms the manufacturers' "combine" prices, and has authorised its Engineer to negotiate privately for new plant.—The Lowestoft Electric Light Committee has decided to instal arc lamps for certain public lighting, instead of half-watt lamps.—The offer to purchase the Stirling electricity undertaking has not met with the approval of the Corporation.—The Hove Corporation has taken up a loan of £180,000 for the purchase of the local electric supply company. (Page 110.)

A 500 kw. turbo-alternator, &c., is required at Bexley; A.C. plant at Dartford; transformers and switchgear at Aberdare; a 1,000 kw. converter at Aberdeen;

distributor cables at Barnes; and a rotary converter, &c., at Southampton.—Loans are to be taken up as follows:—Ipswich (£28,000); Kettering (£12,000); Rhyl (£3,900); Warrington (£14,550).—Electrical stores are required by a large number of municipalities. (Page 108.)

A DIVIDEND of 10 per cent. and a bonus of 5 per cent. is declared by Mather and Platt, and a dividend of 15 per cent. and a bonus of 5s. per share is declared by W. T. Henley's Telegraph Works Co. for 1913.—The proposal of the Yorkshire Electric Power Co. to distribute electricity in districts where there are no provisional orders, does not interfere with the rights of the local authorities to apply for electric lighting orders also. (Page 110.)

## ARRANGEMENTS FOR THE WEEK

### FRIDAY, FEBRUARY 20TH.

*Institution of Electrical Engineers: Yorkshire Section.*  
6.30 for 6.45 p.m. Annual dinner at Hotel Metropole, Leeds.

### SATURDAY, FEBRUARY 21ST.

*Royal Institution.*

3 p.m. Afternoon Lecture II.:—"The Electric Emission of Light," by Dr. J. A. Harker.

*Birmingham and District Electric Club.*

6.30 p.m. Annual dinner at Swan Hotel, New Street.

### MONDAY, FEBRUARY 23RD.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. At Armstrong College, Newcastle. "Some Railway Conditions governing Electrification," by Roger T. Smith.

### TUESDAY, FEBRUARY 24TH.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At University, "Some Railway Conditions governing Electrification," by Roger T. Smith.

*Institution of Civil Engineers.*

8 p.m. "Rail Steels for Electric Railways," by W. Willox, and "Rail Corrugation and its Causes," by S. C. Sellon.

### WEDNESDAY, FEBRUARY 25TH.

*Institution of Electrical Engineers: Birmingham Section.*

7.30 p.m. At University. "Electric Locomotives," by F. Lydall.

### THURSDAY, FEBRUARY 26TH.

*Institution of Electrical Engineers.*

8 p.m. "Motor and Control Equipments for Electric Locomotives," by F. Lydall. The same author's Paper read at Birmingham on Wednesday, February 25th, will also be discussed.

### FRIDAY, FEBRUARY 27TH.

*Institution of Electrical Engineers: Manchester Section.*

7 to 7.15 p.m. Annual Dinner at Midland Hotel.

## The London Electrical Engineers.

*Rating Exam.* for all Co.'s.—7—10 p.m. every Wednesday.

(To-Day) THURSDAY, FEB. 19TH.—C. Co. Tech. Inst., 7 to 10 p.m.

FRIDAY, FEB. 20TH.—D. Co. Tech. Inst., 7 to 10 p.m.

SATURDAY, FEB. 21ST.—Headquarters open 10 a.m. till noon.

MONDAY, FEB. 23RD.—A. Co. Tech. Inst., 7 to 10 p.m. Min. Range Practice, 7 to 9 p.m.

TUESDAY, FEB. 24TH.—B. Co. Tech. Inst., 7 to 10 p.m. Min. Range Practice, 7 to 9 p.m.

WEDNESDAY, FEB. 25TH.—Recruits.—Infantry Drill, 7 to 8 p.m. Tech. Inst., 8 to 10 p.m.

**The Institution Lending Library.**—The Institution of Electrical Engineers has issued a catalogue of 637 books constituting its Lending Library. The Library is open to all classes of members, including students, any of whom may borrow single volumes for fourteen days at a time without fee, and books will be sent by post on application to the Secretary. The list covers a wide field, and a useful feature is that the date of publication is added after each book. Books are listed under the names of the authors, arranged alphabetically, and the addition of a subject index would be an improvement. We regret to see that, presumably by inadvertence, some books which are dedicated to amateurs and describe practice that would not be recognised as correct by the Institution itself, are included. In order to avoid disappointment to members applying for books personally, it should be added that the works in the catalogue are not all in the Lending Library at present, but will be purchased as they are applied for.

## THE LONDON ELECTRIC SUPPLY BILL

SOME particulars with regard to this Bill, obtained from authoritative sources, were published in our last issue. In this connection considerable interest attaches to a statement made by Mr. Walter Leaf, Chairman of the St. James's & Pall Mall Electric Light Co., Ltd., at the Company's general meeting on Tuesday. Mr. Leaf said that his Company had no part in the inception or drafting of the Bill, and heard of it first only through the public advertisement. They would, of course, be glad to have an extension of life beyond the forty-two years given in their Order, but it was essential that they should have a voice in the terms upon which that extension was to be obtained. They had, therefore, deemed it necessary to join with other companies in presenting a petition against the Bill. The Company had been approached by the financial group which desires through the medium of the Bill to effect under the form of a large holding company an amalgamation of all the electric supply companies of London. This scheme was still under consideration by a Conference, and he had no right to anticipate their decision. He could only say that the St. James's Company were not yet satisfied that the scheme would effect the economies and secure the profits which it promised, and they were awaiting further information. The proposal in its present form, he added, would be unacceptable to the St. James's Company, as it failed to recognise the exceptionally strong position which the Company, with others, had attained by prudent and conservative management in the past. As soon as any scheme was presented which was satisfactory to them, they would lose no time in calling a meeting of the Company and laying it before them.

In view of the above statement with regard to the form of the supply companies' opposition to the Bill, which is some what in conflict with a statement from another source made last week, which we felt bound to accept, we have ourselves taken steps to ascertain the true facts of the case. We are able to confirm and to add to Mr. Leaf's announcement above. The following supply companies have definitely petitioned against the Bill:—The Charing Cross Co., the Brompton and Kensington Co. and others (evidently the joint petition referred to, which probably includes the St. James', Westminster and Central Electric, and the Kensington & Knightsbridge and Notting Hill Companies), the London Electric Supply Corporation, the South Metropolitan Co., the City of London Co., and the Metropolitan Electric Supply Co. The London County Council, Corporation of the City of London, and the Marylebone, Hammersmith and Woolwich Councils have also lodged petitions against the Bill up to the present.

The Bill will be taken in the House of Commons first.

**Safety Precautions for Machinery.**—A report by Mr. W. Sydney Smith, H.M. Inspector for dangerous trades, on fencing and safety precautions for transmission machinery, has been issued by the Home Office with the object of explaining the safeguards, structural and administrative, which the experience of the Department shows to be needed for the protection of persons employed. It is pointed out that certain of them are not adequately covered by the existing law relating to mill gearing, and it is proposed that the more important requirements should be embodied in new regulations under Section 79 of the Factory and Workshop Act, 1901. The proposed regulations are given as an appendix to the report (which can be purchased for 6d.), but the formal issue in draft is deferred until occupiers and others concerned have had time to consider the proposals and to submit any observations that they may desire to offer at this stage. The report is fully illustrated, and contains many useful suggestions as to the treatment of couplings, shafting, projecting key heads, belting, &c.

**Interruption of Supply over Ontario Hydro-Electric System.**—On January 31st the supply over about 420 miles of high- and 20,000 miles of low-pressure lines throughout the Niagara district was interrupted for about eight hours. The district affected extended from Niagara Falls, Ontario, to Toronto on the north, and to London and St. Thomas in the west. According to the *Electrical World* (New York), the lines were encased in ice, owing to a sleet storm, when a local hurricane swept across the transmission line between Niagara Falls and Dundas in a straight narrow streak at right angles to the line.

**The Junior Institution of Engineers.**—A Local Section of the Junior Institution of Engineers is to be formed with Sheffield as its centre. The inaugural meeting will be held at the Cutlers' Hall, Sheffield, at 8 p.m., when the Chairman of the Institution, Mr. Ernest King, will occupy the chair. The local Hon. Secretary, *pro tem.*, is Mr. R. J. Stanley (Rose Bank, Totley Brook Road, Dore, near Sheffield). Among the immediate future arrangements we note that there is to be a visit to the Kingston Electricity Works on February 21st. The annual dinner is to take place at the Holborn Restaurant on February 28th. The subject for discussion at the "informal meeting" on February 27th, is "The Operation and Upkeep of Electric Motors," by Mr. E. F. Butler. These meetings are held every Friday at 8 o'clock, at the offices of the Institution. Those who would like fuller information as to the activities of the Junior Institution of Engineers, should write to the Secretary, Mr. A. Clifford Swales (39 Victoria Street, Westminster, S.W.)

## THE LIGHTING OF COVERED TENNIS AND SQUASH RACQUET COURTS

THE satisfactory artificial illumination of covered lawn-tennis courts is a subject presenting peculiar problems: but the successful way in which these have been surmounted in the few electrically lighted courts that have already been established is giving quite an impetus to the construction of covered courts for playing on after dark. Not only have the lights to be arranged so as not to dazzle the eyes of the

FIG. 1.—ELECTRICALLY-LIGHTED COVERED TENNIS COURT AT LIVERPOOL.

players in any part of the court, but there must be bright, uniform, and glareless illumination. An illumination of about 2.5 candle-feet at a distance of 3 ft. from the floor is ample if uniform all over the court, but a little extra light may be provided over the service lines.

We believe that the first artificially lighted lawn-tennis court in this country was that established at Dulwich, where experiments were made with high-pressure gas lighting with overhead lamps all over the courts, and an elaborate compressor outfit driven by a gas engine. The installation as at first carried out was unsatisfactory, and was afterwards remodelled on the advice of Mr. H. M. Rootham, of Craven House, Kingsway, who specialises in covered-court construction and lighting, with lamps in reflectors at the sides, on the same lines as the electrically lighted courts described below. We are told that the total cost of this lighting worked out, including the maintenance of mantles, compressors, &c., at about 1s. 2d. per hour. In further courts for which Mr. Rootham has been responsible electric lighting has been used. The next court to be constructed was one for the Liverpool Racket Club, at Upper Parliament Street, Liverpool. This is a single court, 119 ft. by 56 ft., with a specially designed light steelwork roof, as seen in Fig. 1. The top is glass for day-light illumination, and the sloping sides of the roof are whitewashed, and, acting as reflectors and diffusers, play an important part in the scheme of artificial illumination. The short vertical walls are coloured with a restful green, and the soft deal floor, as at Dulwich, is treated with a special preparation giving a perfectly dead matt black, showing no shadows and incidentally giving excellent foothold. Turning now to the actual lighting, we have at each side, 28 ft. from the floor, four 1,000-c.p. Osram lamps in special reflectors of truncated pyramid form lined with Chappuis ribbed silvered glass, and provided with extra "blinkers" at the side to shield the players' eyes from the filaments. A large part of the light from these falls on the sloping white surfaces opposite them, from which it is reflected down. No direct light can reach the players' eyes near the ends of courts, and in the more central part of the court the lamps can only be seen by looking up at unnatural angles not reached during play. In addition to the main side lamps, there are a pair of 200-c.p. Osram lamps suspended at each end just behind the service lines, well hooded by Chappuis reflectors. These are of use to the server in seeing

his ball specially clearly, and also to the other side in observing his movements well. It will be noted that the current-consumption is just 10 kw. and as a special rate of 2½d. per unit is charged, the cost of current works out at 2s. 1d. per hour. Actually 3s. 9d. is charged to the players for illumination for 1½ hours' use of the court. In this particular club this figure was not objected to, in consideration of the capital cost of the installation being very much below that of a high-pressure gas equipment, but in future cases it is to be hoped that half-watt lamps will be used, enabling electric lighting to beat gas on the question of price as well as all its other manifold advantages. A number of crack players who have had experience of the various lighted courts on the Continent, including the King of Sweden's court, which was the first to be established, declare that the lighting at Liverpool surpasses anything that has been done yet. In one case, as it got dark the lights were gradually switched on one by one, and at the end of the game the players expressed surprise when they found that they were playing entirely by artificial light.

Following the success of the Liverpool court, the matter was taken up by the Dublin Covered Court Club, and two courts were constructed at Ballsbridge. Although for local reasons a system of gas lighting was adopted, lights were arranged in a similar way as at Liverpool with slight modifications, owing to the different style of construction of the roof. Owing to the absence of inclined surfaces, canvas screens are used to diffuse the light. The floor in this case is a special dark brown, as favoured in Germany and used at Bremen and elsewhere; but this is not quite so shadowless as the dead black already referred to. The walls are dark green. Two lighted covered courts are about to be constructed on the same principles at Copenhagen, and the matter is under consideration at Manchester, where three courts are projected, and at Birmingham. In these courts it is probable that half-watt lamps will be employed, as the size of unit employed is eminently suited to their use; but in the cases where the supply voltage is in the neighbourhood of 200 volts, they will, at first, at any rate, have to be grouped in pairs of two in series.

The lighting of squash racquet courts, which are now becoming so popular, is a different and a simpler problem. The great difference is that the floor and walls all round are white, while the ball is dark. It is only lately that the size of these courts has been standardised by the Tennis, Racquets, and Fives Association at 30 ft. long by 21 ft. wide, with 14 ft. clear height. Unfortunately many existing courts, including the famous squash courts of the Royal Automobile Club, are of other dimensions. For lighting a standard court, five 100-c.p. lamps are ample, and in most recently constructed courts each lamp is mounted in a holophane bowl fitting, giving excellent distribution. The lights are all overhead, with four equally spaced and the fifth used to reinforce the illumination on the front wall. This system is used at the new courts at the Adelphi Hotel, Liverpool, two at the Royal Artillery Mess, Woolwich, one at Chislehurst

Exterior.

Interior.

FIG. 2.—ILLUSTRATIONS OF A MODERN FORM OF SQUASH RACKET COURT.

Golf Club, as well as many private courts. A typical court is illustrated in Fig. 2. Mr. Rootham, to whom our thanks are due for the above information, was responsible for the construction of all the tennis and squash courts mentioned in this article, and informs us that he has put up twenty-four squash courts in the last eighteen months, and has something like a further forty coming on. It may be mentioned that he uses a special cement construction which ensures non-sweating walls that can be treated to give a very high degree of reflection.

## ELECTRICAL ACCESSORIES FOR AUTOMOBILES

A PAPER with this title was read by Mr. H. Procter before the Rugby Engineering Society on Tuesday, February 10th. The author commenced by tracing the progress of electrical ignition from the low-tension system to the high-tension and "dual" systems of the present day. In the double-pole system, using a single magneto, a plug with two insulated poles was connected in series with one of the ordinary type. By this arrangement the likelihood of engine stoppage through short-circuiting of the spark-gap by carbonised oil was lessened, and, in the event of this happening to one plug, the short-circuiting substance was immediately burned off. In many cases the latter effect was secured by placing an external spark-gap in series with an ordinary plug. These devices, however, practically doubled the stress on the insulation of the magneto. Special magnetos had been made to operate a double set of plugs, and, to get the engine to start without cranking and without batteries, a small magneto had been devised which, when rotated by hand, discharged across all the spark-gaps, connected for the time being in series. In order to obtain satisfactory spark discharge at low values of engine speed, and thus facilitate starting, plugs having variable gaps were introduced, and in one case the different rates of expansion with increase of temperature of dissimilar metals had been used to effect this automatically. When cold the central electrode was curved towards one of the three outer ones and the gap thus shortened, while, when running at maximum temperature, the distances between it and the three outer electrodes were approximately equal.

The various types of car-lighting systems with and without engine self-starting arrangements, were described. In a type of machine recently introduced from France, the armature moves endwise on its shaft against the pressure of a spring when its speed and current output increase. This motion is produced by pins, fitted with rollers, working in spiral grooves in the bore of the armature spider. In addition to the ordinary commutator, there is a second one with an equal number of segments, but set at such an angle to it that it leads the former by about five segments. These commutators are connected together by a spirally arranged set of connecting bars, in the form of a third commutator. This is separated from the main commutator by a ring of insulating material on its surface, the arrangement of these portions being, commencing at the armature: main commutator, insulating ring, spiral and exciting commutators. At standstill position the main brushes rest on the insulating ring, and the cut-out is thus formed. A third brush, the current from which is used for excitation, presses at the same time upon the exciting commutator, the angular displacement of this producing rapid excitation of the field magnets. As the speed increases the main commutator moves into contact with its brushes. Further movement causes the spiral commutator to be brought under the exciting brush, and the field current is thus gradually reduced. This brush is adjustable to enable the most suitable operating position to be found and fixed.

**Compulsory Working of Patents.**—The Manchester Chamber of Commerce has now issued a pamphlet in "reply to arguments used by the Council of the Chartered Institute of Patent Agents in their pamphlet of January, 1914" (ELECTRICAL ENGINEERING, Jan. 22nd, p. 48). It is made clear that it is not proposed that any alteration be made in the Patent Act, but an alteration of the rules affecting the interpretation of Section 27 so that the burden of proof in an application for revocation is placed on the patentee—an effect which was the object of those who drafted the Act in 1907, but was annulled by a legal decision. Safeguards are proposed to prevent "frivolous" applications for revocation. Among other charges, the Chartered Institute of Patent Agents argues that the motion brought forward by the Manchester Chamber of Commerce is contrary to the first principles of law, because it calls upon the defendant (patentee) to prove or disprove the plaintiff's (applicant's) case. The Chamber of Commerce, in reply, cites the case of a trader who applies to the Railway Commissioners for a lower railway rate, and is entitled to call on the company to prove that the rate they demand is reasonable. It is also pointed out that no machinery exists at the Patent Office for the applicant for revocation to obtain discovery by interrogatories.

**Electrical Trades Benevolent Institution.**—Mr. Hugo Hirst will occupy the Chair at the Annual Festival Dinner of the Electrical Trades Benevolent Institution, which is to be held on Wednesday, March 25th, at the Trocadero Restaurant. The annual general meeting will be held at the Institution of Electrical Engineers on Wednesday, March 18th, at 2.30 p.m. The Committee hopes for a large attendance.

## CAST IRON WITH THE PROPERTIES OF STEEL

A N electrolytic process for so reducing the impurities in cast-iron, and so altering its structure as to change it into what may be called steel, is being developed by the Vacani Syndicate, Ltd., at its private laboratory. We recently were afforded facilities for seeing specimens of the iron, in the form of rods about  $\frac{3}{8}$  in. in diameter, before and after treatment, and verified that there was a great increase in strength and a change in the structure, as shown by fracture. The results of tests have shown that a piece of an iron casting turned down to  $\frac{3}{8}$  in. in diameter had, after treatment, a tensile strength of 35.2 tons per sq. in., and an elongation of 27.5 per cent., on a length of 0.8 in. The fracture was designated as "silky." A rod about 11 in. long and  $\frac{3}{8}$  in. in diameter has shown, after treatment, a tensile strength of 45.1 tons per sq. in. and an elongation of 15 per cent. on a length of  $1\frac{1}{2}$  in. A similar rod, which was not treated, has shown a tensile strength of 9.9 tons. A small plate about  $\frac{3}{8}$  in. by  $\frac{1}{2}$  in. section, when tested, has shown a tensile strength of 29.4 tons per sq. in., and an elongation of 32 per cent. on a 1-in. length. The fracture was designated fibrous. In this case the percentage of impurities present in the cast-iron was reduced after treatment as follows:—Total carbon, from 3.147 to 0.074; graphitic carbon, from 2.484 to an undetermined amount; combined carbon, from 0.633 also to an undetermined amount; silicon, from 2.193 to 0.185; sulphur, from 0.109 to 0.013; phosphorus, from 1.080 to 0.275; manganese, from 0.477 to a trace; arsenic, from 0.035 to an undetermined amount; and nickel, from 0.036 to 0.050. The process, which is the subject of an application for a patent, depends on the treatment of the cast-iron in an electrolytic bath with a carbon anode, and also with a nickel cathode. Adjusting means are provided to vary the applied pressure in accordance with a scheme evolved by experiment, and during part of the treatment what is called a "high-fusion current" is passed. The offices of the Vacani Syndicate, Ltd., are at 52 Leadenhall Street, E.C.

**Electricity in Agriculture.**—Prof. J. H. Priestley has been carrying out (in conjunction with Mr. R. C. Knight) experiments to determine the exact functions of the plant which are affected by the applications of electricity to increase the rate of germination, growth, and yield of the plant, in continuation of the experiments mentioned in ELECTRICAL ENGINEERING of Oct. 30th, 1913, p. 603. So far, the results lead the experimenters to believe that the currents of from  $10^{-4}$  to  $10^{-4}$  amperes, which were employed, have no effect on the respiration of the plants other than that due to accompanying changes of temperature (which is, of course, absent in the field). The tests were made on germinating peas, and also on seedling peas, Brussels sprouts, wheat, and rye. The tests can, however, not be regarded as conclusive, as it is admitted that practically all the current was carried by the film of moisture surrounding the seeds and seedlings, the conductance of which was much higher than that of the seeds and seedlings themselves. It was also found that the gaseous products of the discharge in air had no effect on the germinating peas, but were deleterious to young seedlings. The experiments are described in a Paper published in the "Annals of Botany" (Vol. XXVIII., No. CIX., Jan., 1914).

**Sell's Directory.**—The 1914 issue of Sell's well-known and useful directory of registered telegraphic addresses is a bulky volume, and contains the usual alphabetical list of firms in the United Kingdom, with telegraphic addresses and telephone numbers, index to telegraphic addresses, classified trades list for the United Kingdom, as well as lists of British Empire overseas and foreign cable addresses. All information received from the Postmaster-General up to January 1st is included. With regard to the London addresses, it is noticeable that over 25,000 registrants have adopted the recently introduced indicator word system. The classified list embraces some 100,000 addresses, and the whole volume is most complete. Every care has been taken to confirm the entries, and to render all the information accurate. The very latest information which arrived too late for classification in the body of the work will be found in a separate list at the end.

**"Faraday House Journal."**—As usual, the current number of this periodical contains notes on the doings of Old Faradians, and some brief biographical notices, this time of Mr. P. V. Hunter and Mr. A. Beadle. The articles published include "Notes on the All-day Efficiency of Static Transformers for Use in Lighting Loads," by Mr. R. Crosbie-Hill, and Mr. W. J. P. Orton traces the development of switchgear for power schemes, and describes the specialised varieties in use at the present time. We note that the Annual Dinner of the "Old Faradians" has been arranged for Friday, May 1st, at the Hotel Cecil.

## CONDITIONS GOVERNING RAILWAY ELECTRIFICATION

THE first Paper of a series embracing the whole problem of railway electrification was read at the Institution of Electrical Engineers on Thursday last by Mr. Roger T. Smith. The Paper was also read at Birmingham on the previous Wednesday, and at Glasgow last Tuesday. The title was, "Some Railway Conditions Governing Electrification," and it dealt with present conditions in this country. Taking full advantage of track-circuit signalling and motor-coach trains with high acceleration and deceleration, a maximum of forty-eight trains an hour could be run each way during rush hours, said the author, while employing existing stations and tracks. The number of trains run and the increase in schedule speed had in many cases enabled the number of passengers carried to be doubled. The number of motor-coaches should be so chosen that the weight on the driving wheels was not less than 25 per cent. of the total train weight. It was more often 33 per cent., and could be as high as 100 per cent. Among the advantages of the multiple-unit-controlled motor-coach train were the doubling of terminal accommodation by halving the number of signal and locomotive movements, and the use of a train of length to suit the traffic. Most of the suburban services into and out of London already or in process of being electrified were run on tracks distinct from the main line, and such a service became a thing apart. It could be electrified on any system which best suited its conditions, and the method might be quite different from one subsequently desired for main-line electrification. The question was purely one of finance. Suburban fares had been falling steadily, and everybody in London and its suburbs was carried at too low a fare to give proper remuneration to any form of traction which, in addition to rates and taxes and Government duty on some fares, paid for its road and the right to use it. To make electrification really pay either fares must be increased or the price of energy delivered to the conductor must be reduced to about  $\frac{1}{4}$ d. per kw.-hour.

Coming to the question of the electrification of fast passenger services the author said that the engineering problems which had to be solved in this country had hardly been considered. Taking a modern 4-6-0 type of steam locomotive as representative, the adhesive weight was limited by structures to 60 tons and by usual practice to 56 tons. The starting draw-bar pull was limited to about 16 tons, and until a speed of about 12 m.p.h. was reached the maximum was 12 tons, determined by the adhesion. A constant output locomotive was satisfactory for this class of service, but, with the exception of certain three-phase locomotives in Italy and America, all electric locomotives had been built with series characteristics. The torque of the series motor, however, fell off so rapidly that above 60 m.p.h. no electric locomotive yet built for such maximum loads as obtained on our railways could give anything like 1,100 h.p. at 70 m.p.h., as was given by the 4-6-0 steam locomotive. One object of the series winding was to saturate the field of the motor at starting, and, provided it was saturated, no extra current was of use. The field could equally well be saturated by separate excitation, which opened out the possibility of a shunt characteristic with variable speed for the D.C. motor, voltage variation already providing several running speeds with the single-phase motor.

On the assumption that the passenger steam locomotive ran about 27,000 train miles in the year, and the electric locomotive 40,000 train miles (multiple-unit motor-cars ran 45,000 to 50,000 miles per annum), the mean cost for locomotive expenses (including capital charges) per train mile would be about 10 $\frac{1}{4}$ d., of which 3d. represented the cost of coal and water. If electricity could be purchased for  $\frac{1}{4}$ d. per kw.-hour, the cost of electricity per passenger-train-mile was about the same as the cost of coal and water in the steam locomotive. Thus the cost per train-mile with the electric locomotive would be 10 $\frac{1}{4}$ d. The capital cost of locomotives and the cost of energy must be reduced to show any advantage on the side of electrification.

For goods and mineral service the same ratio of cost between coal and electricity per train-mile would hold with electricity at  $\frac{1}{4}$ d. per kw.-hour. It was here that the electric locomotive appeared to have its best chance. As a general rule trains of more than sixty trucks were not conveniently dealt with in the lay-by sidings. This and the limited draw-bar-pull determined train weights. The mineral traffic of the North Eastern Railway on the east coast was, however, free from these drawbacks. Electricity could be purchased cheaply from the power companies. The mineral line between Shildon and Newport (Middlesbrough), a distance of eighteen miles,

was now being electrified. Two sub-stations would supply at 1,500 volts D.C. through overhead conductors and through a protected conductor rail. The locomotives would haul mineral trains of 1,400 tons at a speed of 25 m.p.h. on the level, and start an 800-ton train on a grade of 1 in 100. Apart from suburban, this was the most interesting railway electrification contemplated, and if successful it would be the real beginning of goods electrification. The arduous duties of a shunting locomotive could probably be best met by a single-phase locomotive.

The discussion in London was opened by Mr. H. W. Firth (G.E. Railway), who expressed himself in agreement with the author on most points. If a 100 per cent. load factor on a suburban service were possible, he said, then would an adequate return from electrification be obtained. He did not think that 48 trains per hour in each direction could be run in London on account of the flat junctions and terminal accommodation, but it might be maintained for about a quarter of an hour. As during the holiday seasons suburban trains were often called on to run over the main lines, the equipment must be suitable for both services. The characteristic of the motors must be made more flexible than it was at present. The author was not quite right in saying that with motor coaches the usual signal movements were halved and the terminal capacity doubled. On the Berlin Stadtbahn, under steam and electric services, the numbers of trains possible per hour were 32 and 40 respectively, and 21 and 33 respectively in the terminals. Thus the terminal factors were 0.656 and 0.825 respectively. On the question of goods traffic, he would say it was no use having a locomotive which could do 50,000 miles per annum. Many traffic schedules did not call for locomotives of greater capacity than existing steam locomotives. Mr. J. B. Sparks concluded that suburban working under electricity and steam conditions could not be economically compared. He suggested that it would be most dangerous to work two different systems. He could not agree with the author's estimate of costs, and he criticised these in detail. With main-line electrification they must remember that there would be a saving due to reduced coal haulage of about 4.6 per cent. Also only 70 per cent. of the number of steam locomotives would be required under electrical conditions. The Pennsylvania Railway obtained an average of 30,000 miles per annum per electric locomotive, based on an average of 33 locomotives and the New York Central on an average of 28 locomotives about 28,800 miles. Dr. S. P. Smith (City and Guilds, Engineering, College) suggested a design for a locomotive to give 1,100 h.p. at 70 m.p.h. with a draw-bar pull not exceeding 12 tons at starting. He appeared to hope that all railways would be compelled by law to electrify their lines for a certain distance from London. Mr. W. M. Mordey argued that the whole lay-out of railways was bad, and that instead of demanding cheaper locomotives and reduced prices for current, the railway companies should look to the problem of regeneration in some form. The Central London Railway and the Liverpool Overhead Railway were good examples of what could be done in this respect. Mr. H. M. Sayers thought that it would pay most lines to electrify, even though this was not always, perhaps, apparent. Mr. Roger T. Smith, in his reply, said that the figure of 48 trains per hour in each direction given in the Paper was lower than the figure of 50 which had passed unchallenged through Parliamentary Committee Rooms. They were already running 44 and 45 trains per hour on the District Railway, and this number would shortly be increased to 48. He had taken Great Western Railway conditions as a basis for his figures of mileage of locomotives. On the Harrow section of the Metropolitan Railway the electric locomotives had run double the mileage of former steam locomotives.

**The International Rubber Congress.**—At the International Rubber Exhibitions of 1908 and 1911, papers were read on everything connected with the production of rubber, and discussions followed that brought to bear the experience of experts from every rubber-growing country in the world. Those papers and discussions were fully reported and reproduced in two books that form valuable works of reference on every question connected with the industry. Mr. Henry A. Blake, President of the fourth Rubber Exhibition and International Rubber Congress, which opens on June 24th, will be glad if any persons who desire to read Papers on any subject connected with the growing, curing, or manufacture of rubber, or the possible expansion of its uses, or to take part in the discussions, will kindly communicate and register their names as early as possible with the Hon. Secretaries of the International Rubber Congress, Exhibition Offices, 75 Chancery Lane, London, W.C.

**Reinforced Concrete.**—The February number of "Concrete and Constructional Engineering" contains an illustrated article on the new offices for the Board of Agriculture and Fisheries. An interesting account is also given in an article by Mr. E. R. Matthews (Borough Surveyor, Bridlington) on the application of concrete and reinforced concrete construction in some recent municipal works at San Francisco. Other matter contained in the number includes illustrated descriptions of the concrete construction at the Hydro-Electricity Works, Chester; some harbour improvements at Iloilo, Philippine Islands; a water tower at Burton-on-Trent; and a gasholder tank near Hamburg.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,379.

It is required to bring a voltage of 275 A.C. down to 250. Is a choking coil the right solution? If so, give full particulars necessary to make one for a full-load current of 40 amperes at 50 cycles.—"SPARK."

(Replies must be received not later than first post, Thursday, Feb. 26th.)

### ANSWERS TO No. 1,377.

What are the more usual methods, other than the use of automatic regulators, for compounding alternators? How is the compounding effected, and what are the relative advantages of the different methods? Also, is it practicable to "over-compound" a machine in this way.—"F. M."

The first award (10s.) is given to E. P. HILL for the following reply:—

The principles upon which compounding of alternators is effected may be classified as follows:—(a) Inherent field reaction (typified by Walker system); (b) exciter field reaction method (Rice system); (c) rectification method (Heyland system). The first method has been found to be quite satisfactory for ordinary central station units of medium and large capacity, and has the advantage that an ordinary exciter is employed, the compounding being provided by the load current in the stator windings reacting on an unsaturated portion of the main generator field. Fig. 1 shows the principle for a salient pole rotor, the

FIG. 1.

FIG. 2.

same method being modified by the Westinghouse Co. for their cylindrical turbo-rotors, as shown in Fig. 2. *S* is the normal field path, which is in this case designed so as to be almost saturated; the by-pass path for the flux is unsaturated and at no load is unmagnetised. As the load increases the cross-magneto-motive-force tends to weaken *S* and strengthen *B*. *S* can alter very slightly only, whereas *B* becomes strongly magnetised, and a higher total flux results in the alternator voltage rising or remaining constant as the design allows. The method is unsuited for lower power-factor systems than 0.8, as the wattless component demagnetises *B* and causes greater voltage drop than normal. Central stations of to-day rarely run on heavy loads with such a low power-factor on account of the large proportion of rotaries in use, and the simplicity of its automatic regulation renders the method very valuable in view of the fact that the safety of the machine is not impaired, as the short-circuit current is identical with that of an ordinary standard

alternator. Many of the largest units in Great Britain are compounded on the above system, which is due to Prof. Miles Walker.

The second method (exciter field reaction) requires a special exciter having a rotary converter type armature. For a three-phase alternator the secondaries of current transformers in mains are connected to three slip-rings, so as to produce a rotating field in space around the exciter armature proportional to load on alternator. This reacts on the ordinary exciter field system, and by it on the alternator field. The beauty of this method is that low power-factor in load causes strengthening of exciter field (by virtue of the usual synchronous motor effect) in exciter, leading current weakens field, and a fairly accurate adjustment is therefore obtainable over a wide range of conditions. This method is referred to often as the compensation method, and is best applied to three-phase work. It was originated by Mr. Rice, of the American G.E.C.

The development of the third, or rectification, method by A. Heyland in connection with three-phase alternators has found favour on the Continent, but has not been largely used in Great Britain. It requires an expensive exciter or rectifier, which is liable to commutation troubles, but has certainly been perfected by the patentee to bring it into commercial use, and enable it to give its good regulating performance. He now uses for the supply to his rectifier a series and a shunt transformer, so as to obtain on the main field a constant set of pulsations (unidirectional) and a variable set proportional to the load on the machine. The transformers are so connected that compounding voltage leads the steady voltage in phase, the resultant pulsations being greater the lower the power-factor. The alternator poles are standard, but the field coils are in several parallel paths to damp out pulsations.

There are several other methods in use which are modifications of the three principles reviewed. The Parsons method is worthy of mention; it has the disadvantage that power-factor is not automatically compounded for, but, as previously mentioned, this to-day in heavy units is not necessary. The principle upon which their compounding obtains is analogous to the Walker method, except that the exciter is used instead of the main field. A bye-pass is provided across the exciter field system, and the leakage flux is regulated by the load current (through transformers), so that on heavy loads the leakage path is of high reluctance and the lines of force take the normal path across the airgap and through exciter armature, therefore raising alternator voltage. All these methods are capable of overcompounding except method A on very low power-factors.

The second award (5s.) is made to "A. H. B.," whose reply may be summarised as follows:—

Since the regulation of an alternator is worse at lagging power-factors than at unity, any compensating device other than a regulator directly controlled by the voltage itself must be dependent upon the power factor as well as the actual current taken from the machine.

In some systems a commutator is used to rectify the secondary current from a current transformer in the line. This rectified current is passed through a "series" winding on the alternator field, usually smoothed out by means of reactances and shunt resistances, so as to avoid excessive eddy currents in the field magnets. In polyphase machines the connections to the different phases can be made so as to give a larger rectified current as the power factor of the load decreases, and thus the alternator can be either flat compounded or over-compounded for all loads and power factors likely to be experienced. A simple commutator having two or three bars per pair of poles can be used, but a better system is that of Heyland, though it is somewhat more complicated. Instead of a commutator, a mercury vapour or similar rectifier can be used. The rectified current may be used on the exciter field instead of the alternator field. In other methods the alternating current from the transformer, instead of being rectified, may be fed direct into the exciter armature by sliprings. If the arrangement of theappings is such that this current is approximately 90° in advance of the load current in the exciter armature, it will tend to increase the exciter field, but in all these methods there is a time-lag due to the self-induction of the alternator field.

"A. H. B." then describes the Miles Walker compounding system, which he regards as the best system so long as the power factor can be relied upon not to fall below about 0.85. The laminated iron leakage path method described in the previous reply is also mentioned.

**Shipping, Engineering and Machinery Exhibition.**—Admiral H.S.H. Prince Louis of Battenberg, First Sea Lord of the Admiralty, will open the Shipping, Engineering and Machinery Exhibition at Olympia on September 25th, at 3 o'clock.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A Paper by Mr. P. R. Coursey was read at the Institution of Electrical Engineers Students' Section meeting on January 28th. Mr. W. Duddell occupied the Chair. The author reviewed briefly some of the principal types of portable wireless apparatus that are now in actual use. The tendency in modern apparatus of this character is to use transmitters having flat resonance curves, with unidirectional aeriels, and receivers capable of very sharp tuning so as to be able to differentiate between different transmitting stations to the utmost degree. They are obtainable in sizes from 0.04 kw., with a maximum range of about twelve miles, up to 1.5 kw., with a maximum range of about 250 miles, arranged for different modes of transportation. A recent innovation by the Marconi Co. is a small set for aeroplanes. A trailing wire attached by a safety plug, arranged to release the wire in case of extra strain, is generally used as aerial, and the metalwork of the machine serves as the counter capacity in place of earth. For short-distance communication it is possible, however, to do away with the trailing cable and mount the wire in the machine itself. It is difficult to receive messages by telephone on account of the noise of the engine, but the Fleming oscillation valve is not so much affected as other detectors, and gives a loud signal. A new type of portable apparatus devised by Mr. Dubilier has undergone successful trials. The transmitter complete in box weighs about 30 lb., and with 75 to 100 watts gives a range of thirty to forty miles when used with an inverted "L" aerial some 50 ft. high. The apparatus sends a pure musical note by means of a series of unidirectional impulses obtained from regular condenser discharges, giving a note or spark frequency of 500 to 750 per sec. This is obtained by impressing between 50 and 250 volts on the terminals T T in the

figure. M and P have high inductance. M controls the vibrating contacts V. It takes about 0.001 sec. for these to open. At the instant of break the condenser C (of about 3 to 4 mfd. capacity) is charged to a higher voltage than that of the supply on account of the self-induction M. After a further period of 0.001 sec. the contacts V close again, and the stored energy of C discharges through P, while C and P are so proportioned that the first half-wave of the discharge is completed in exactly 0.001 sec. from the closing of the contacts, so that they break at the instant of zero current. P is made the primary of a step-up transformer of the open-circuit type with well laminated core. The secondary S is tuned to the primary, so that the secondary pressure is further augmented and feeds a multiple gap quenched discharger of thin metal plates. The usual oscillation and aerial circuits are connected across the gap, though an ordinary open spark may be used without much impairing the note. The tuning and efficiency, however, is not so good. A portable wireless telephone by the same inventor is said to have given a speaking range of about 500 miles, using 2 to 3 kw. at 500 volts. This feeds a quenched arc which produces continuous oscillations above the limits of audition. A multiple microphone is used in the aerial circuit. In another ingenious apparatus, due to M. Magunna, tuning forks control contacts shunted by a condenser. Up to 5 amperes at 220 volts can be regularly broken. A range of fifty miles by day has been reached with an expenditure of about 300 watts. On January 23rd the author read a Paper before the Physical Society entitled, "Some Characteristic Curves

and Sensitiveness Tests of Crystal and Other Detectors." The investigation showed that in the majority of cases the second differential of the characteristics gives a good indication of the sensitiveness of the detector, as in the case of the oscillation valve, but that some detectors, notably the galena and electrolytic, seem to show that there are other actions at work which may oppose the one depending on the curvature of the characteristic. Since this also occurs with one of the electrolytic detectors tested, it perhaps points out that this other action may be electrolytic in nature.

A motor-driven lifeboat, just fitted to the Allan liner *Alsatian*, is provided with a wireless outfit having a range of about 100 miles.

The Inspectors of the United States Department of Commerce have recently been compelled to refuse permission for several steamships to leave American ports owing to the bad installation and repair of the emergency wireless apparatus carried.

An issue of £200,000 6 per cent. bonds at 97 will, it is believed, be shortly made by the Constantinople Telephone Co.

On the 3rd inst. censorship on messages for the Union of South Africa was announced, as well as the interruption of the lines of the Indo-European Telegraph Co. between Rowno and Odessa, which were restored on the 4th inst.—The Zanzibar-Mombasa cable was repaired on the 6th inst.—The Compagnie Française des Câbles Télégraphiques are once again troubled by the breakdown of their section between Paramaribo and Cayenne, and messages for the latter place have to go via Western. The Ceuta-Tangier cable has also failed, and messages going by other than Eastern routes are sent by boat from Cadiz or Algeciras, and are therefore subject to delay.

## ELECTRIC TRACTION NOTES

At the annual meeting of the Great Eastern Railway Co. on Friday last, Lord Claud Hamilton announced that Mr. Henry W. Thornton, General Superintendent of the Long Island Railroad, New York, had been appointed to succeed Mr. Walter Hyde as General Manager of the Great Eastern Railway. Mr. Thornton has had experience in connection with the congestion of suburban traffic in New York and the problem of electrification. No doubt an improvement in the suburban service of the Great Eastern Railway may be effected by its conversion to electric traction.

The standard forms of charging plugs for electric vehicles recently adopted by the Electric Vehicle Association of America are shown below. The drawings have been made from information contained in the American electrical

journals. The upper plug and socket is of 50-ampere capacity, and the lower plug and socket is of 150-ampere capacity. The Nation Board of Fire Underwriters has approved the plugs for overloads of 50 per cent. The outer contact is of positive and the inner contact of negative polarity.

The Board of Trade has sanctioned the use of petrol-electric trams on the front at Hastings in substitution for the Dolter surface-contact system.

**The Unrest among Electrical Workers in London.**—There is no new development at present, and the position is much the same as that reported in our last issue. Both the central station employees and the wiremen are working contentedly. The Association of Electrical Station Engineers has received courteous acknowledgments of its letter from the majority of the supply authorities and electric railway companies, and the Electrical Trades Union are awaiting the amended working rules and rates of wages from the London Electrical Masters' Association.

"Telephone Cables." By J. C. Slippy, of Pittsburg. 147 pp. 7 in. by 4½ in. 97 figures. \$2.50. This small volume constitutes a useful epitome of American practice with regard to the specification and lay-out of the cable part of the telephone network, particularly overhead work. THE KILOWATT PUBLISHING Co., LTD., Temple Chambers, London, E.C., holds a small stock of this book, and will be pleased to supply copies at 10s. 6d. net each.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Feb. 12th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

23,689/12. **Combined Turbo-Alternator.** A. ROLFE. The alternator is of the induction type. The windings are embedded in the turbine rotor and casing. Constructions for other types of generator are also given. Eight figures.

1,442/13. **Lamp Filament Supports.** J. M. ROUX and J. SANCHEZ. The supports are curved and diverge from one end to the other with their concave sides outwards. These supports may be combined with others in the same bulb. Six figures.

1,939/13. **Dischargers for Wireless.** W. TORIKATA, E. YOKOYAMA, and M. KITAMURA. The stored energy in an inductance and electromagnet cause the gap to be broken down a moment after current is applied. The magnet has two armatures controlling circuits feeding the gap, so that the discharge is maintained. One figure.

7,376/13. **Telephone Call Meters.** A. STERRY. A switch, buzzer, and counting mechanism are fitted to each subscriber's telephone. When a call is made the subscriber closes the switch which works the buzzer and the counting mechanism. The operator, hearing the buzz, makes connection. A meter can also be situated in the exchange. Four figures.

16,481/13. **Carbon-Cobalt Filament.** C. KANAZAWA. A raw filament is prepared from cellulose solution containing cobalt oxide and manganese sulphate in a solution of zinc chloride. This filament is heated to a white heat in a crucible with graphite under vacuum for over 20 hours. It is said that the filament is strong, efficient, and has a long life not affected by vibration.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** *PODMORE* [Insulators] 1,658/13; *SIMON, ROBERTS and CHADWICK* [Storage battery charging] 2,469/13; *B.T.-H. Co. (G.E. Co., U.S.A.)* [Motor control] 3,684/13; *TORPEY* [Insulating slabs] 15,975/13.

**Dynamos and Motors:** *LEE and OLDFIELD* [Variable speed constant output dynamos] 1,990/13; *RUBEL* [Dynamo iron] 3,445/13; *VANDERVELL and MIDGLEY* [Ignition] 5,013/13; *B.T.-H. Co. (French Thomson-Houston Co.)* [Regulation] 6,285/13.

**Electrometallurgy and Electrochemistry:** *MARKS (Elec. Smelting & Aluminium Co.)* [Fertilisers] 2,485/13; [Di-calcium phosphate] 2,486/13; *GIULINI* [Aluminium] 8,166/13; *SIEMENS BROS. (Siemens & Halske A.-G.)* [Röntgen-ray tubes] 20,482/13.

**Heating and Cooking:** *WEAVING and FERRANTI Co.* [Ovens] 8,962/13.

**Ignition:** *LECOCQ and VAN DER AA* [Motor starting] 14,799/13; *DUPONT* [Automatic motor starting] 15,269/13.

**Incandescent Lamps:** *B.T.-H. Co. (G.E. Co., U.S.A.)* [Tungsten] 1,915/13; *HAYNES* [Alloys with cobalt] 2,487/13; *LOWDEN*, 7,722/13.

**Meters:** *BRITISH INSULATED Co. and WILSON* [Prepayment] 4,472/13.

**Switchgear, Fuses and Fittings:** *ELECTROMECHANISCHE INDUSTRIE GES. and HERRMANN* [Miniature lighting switch] 1,895/13; *HORSTMANN and EDGAR* [Time-switches] 2,588/13; *WILLIAM MCGEOCH & Co. and REYNOLDS* [Switches] 2,757/13; *B.T.-H. Co. (G.E. Co., U.S.A.)* [Switches] 3,462/13; *LUNDBERG and PEGG* [Plugs and sockets] 11,960/13; *DAVIES and BODELL* [Locking incandescent lamps in their holders] 18,568/13; *REEVES* [Anti-vibration device for lamps] 19,857/13; *HULBERT* [Regulators] 23,110/13.

**Telephony and Telegraphy:** *MARCONI* [Transmitters for wireless] 2,918/13 and 2,919/13; *GIRARDEAU* [Feeding wireless aërials] 14,035/13; *WESTERN ELEC. Co. (Western Elec. Co., U.S.A.)* [Telephone transmission circuits] 20,179/13; *WIDEGREN* [Transmitter for writing telegraphs] 29,241/13.

**Traction:** *HELFENSTEIN* [Track contacts] 8,267/13.

**Miscellaneous:** *EISENMANN* [Musical instruments] 24,260/12; *LAKE (Elec. Boat Co.)* [Submarines] 1,912/13; *BRUNN* [Surfaces for controlling electrically operated mechanism] 2,295/13; *ATTWATER* [Miners' safety lamps] 2,372/13; *BROWN, BOVERIE ET Cie and THALLMAYER* [Braking of machinery] 2,586/13; *MACKENZIE (Cook Rly. Signal Co.)* [Battery compounds] 7,298/13; *BENTLEY* [Clocks] 8,464/13; *FEDERICO and SEGALIN* [Controlling electric clocks] 12,638/13; *SAND* [Quartz-glass, &c.] 15,629/13; *ARON* [Motor-car headlamps] 17,502/13; *STEPHENSON* [High-pressure indicator] 18,975/13; *HITZELBERGER and NEW BRITISH EVER-READY Co.* [Electric torches] 24,943/13.

The following Specifications are open to inspection at the Patent Office before acceptance, but are not yet published for sale.

**Dynamos, Motors and Transformers:** *BETHENOD* [Maintaining a dynamo at constant pressure] 27,945/13; *HEINZ* [Electrolytic A.C.-D.C. converter] 28,630/13; *SIEMENS SCHUCKERTWERKE GES.* [Regulating torque of polyphase motors] 1,640/14.

**Electrometallurgy and Electrochemistry:** *AUGUST SCHWARZ* [Carbon electrode holders] 24,900/13; *NORSK HYDRO-ELEKTRISK-KVALSTOFABRIKSELSKAB* [Reduction of nitrate of lime and other salts to powder] 468/14.

**Switchgear:** *BERAUD* [Time switches] 945/14.

**Telegraphy:** *NIGRON* [Printing receivers] 1,548/14.

**Traction:** *JULIUS PINTSCH A.-G.* [Signalling] 3,561/13.

**Miscellaneous:** *GIRARDELLI* [Transmission from a distance of adjusting movements] 1,265/14.

The following Amended Specifications may now be obtained:—

**Dynamos:** *A. H. MIDGLEY and C. A. VANDERVELL*, 9,112/11.

**Telegraphy and Telephony:** *W. P. THOMPSON (Ges. für Drahtlose Telegraphie, Germany)* [Wireless transmitter] 16,827/12.

### Application for Restoration of Lapsed Patents

15,544/09, 15,681/09, and 15,682/09. **Switchgear, &c.** *BERTRAM THOMAS and E. THOMAS*. Application has been made by the patentees for restoration of these patents, which expired during July, 1913, owing to the non-payment of the renewal fees. The first patent relates to an electro-magnetic crane brake, the second to an enclosed disc-type controller, and the third to a current collector for use in electric jib cranes.

### Amendment to Specification

16,827/12. **Wireless Transmitters.** *W. P. THOMPSON (Ges. für Drahtlose Telegraphie, Germany)*. As a result of the extended investigation under Section 8, this specification has been amended by way of disclaimer.

### Grant of Patent Allowed

9,981/12. **Drawn Tungsten Filaments.** *C. H. FISCHER*. The Comptroller has decided to allow the grant of this patent [ELECTRICAL ENGINEERING, May 8th, 1913, p. 264, Vol. IX.], in spite of the opposition.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

3,343 of Feb. 20th, 1900. **Siphon Recorder:** *Curbing. A. MUIRHEAD*. To improve the character of telegraph signals received by a siphon recorder or recorder coil relay, the movements of the signal coil are curbed by local means actuated by the received current. The relay to effect this has a moving contact composed of three insulated conducting sections, of which the central one is in a common local circuit.

3,461 of Feb. 21st, 1900. **Automatic Electro-Magnetic Brakes.** *WESTINGHOUSE BRAKE Co. (F. C. Meewell and F. M. Herr, U.S.A.)*. The brake-shoe is divided into parts of different section. Each has its own coil so designed that each shoe is saturated at a different current. The magnetic is interconnected with a mechanical brake so that the latter is applied by the former. The strength of the magnetic brake can be adjusted and the number of sections of the shoe operative varies with the current.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** *E. GIRAUD* [Overhead line construction] 20,687/05; *A. C. and R. H. MARTIN* [Train lighting systems] 23,755/06; *B.T.-H. Co. (G.E. Co., U.S.A.)* [Gun turret and printing press motor control] 23,894/06 and 23,896/06; *M. KALLMANN* [Motor control] 9,859/08.

**Dynamos and Motors:** *H. G. REIST* [Ventilating] 23,710/07.

**Ignition:** *R. AYTON*, 23,810/06.

**Incandescent Lamps:** *W. FAIRWEATHER (Glühlampenwerk Anker Ges., Germany)* [Filament manufacture] 23,585/07.

**Switches, Fuses, and Fittings:** *B.T.-H. Co. (E. M. Hewlett, U.S.A.)* [Overload loose-handle circuit-breaker with magnetic blow-out] 19,498/00.

**Telegraphy:** *C. MEYER* [Order telegraphs or alarms] 18,670/07; *S. G. BROWN and J. A. L. DEARLOVE* [A submarine cable is tuned to the frequency of maximum speed] 23,977/07.

**Traction:** *B.T.-H. Co. (F. E. Case, U.S.A.)* [Multiple-unit control: Control current supplied by storage batteries] 19,499/00; *E. J. CHAMBERS* [Rail insulators] 23,201/04.

**Miscellaneous:** *J. GOEHST* [Illuminated signs and lamp-holders] 23,224/03, 23,225/03, and 23,226/03; *M. R. HUTCHISON* [Motor-car horns] 21,823/05; *W. FAIRWEATHER (Aktiebolaget L. M. Ericsson & Co., Sweden)* [System of secondary clocks] 22,713/08.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 109. —

### A "STAR-DELTA" DRUM STARTER

A ROBUST drum-type "star-delta" starting switch, manufactured by the Igranic Electric Co., Ltd. (147 Queen Victoria Street, E.C.), has recently been put on the market after exhaustive trials. Only mica insulation is used. The carcass of the switch is of cast-iron, with a strong sheet-iron front cover. The fingers are carried on massive supports clamped to an iron supporting bar. Each support is separately insulated by mica from the others and from the bar. Each finger is directly attached to its terminal, so that the effect of each external connection is plainly seen, and all screws are very accessible. Each finger is a long brass punching with a copper tip, and is easily removable independently of any other. It is held in contact with the shoe by a steel spiral compression spring, the result being that it makes a straight line contact with the shoe and makes "stutting" (or doubling up of the fingers) impossible.

"IGRANIC" STAR-DELTA  
STARTER.

This method of fixing ensures great flexibility of movement and at the same time ensures good electrical connection between the finger and the terminal. All the springs are plainly visible and easily accessible, and they are not used to carry current. The copper shoes are secured to the drum by countersunk screws, and are, consequently, easily renewable, the whole drum being readily removable from the case or any section from the shaft. A pointer rigidly attached to the operating handwheel registers with an index plate on the outside of the case, and shows whether the switch is in the "off," "start," or "run" position.

To start the motor, the movement of the hand-wheel is clockwise throughout, so that it is not possible to go from the "off" to the "run" position without passing through the "start" position. The illustration shows the internal arrangements, including the neat automatic overload and no-volt releases. We understand that the Company has standardised five different types of this starter, and any of them can be made suitable for oil immersion.

### MAZDA AUTOMOBILE AND BATTERY LAMPS

A NEW price-list has just been published by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper

MOTOR-BUS LAMP.

HEAD LAMP WITH HELICAL  
FILAMENT.

DECORATIVE  
LAMP.

Thames Street, E.C.), giving revised data and reduced prices of drawn-wire automobile and battery lamps, as now standard-

ised by the leading lamp manufacturers of this country. The range of Mazda automobile lamps is very complete, and includes headlight lamps, with special Mazda design of helical filament, sidelight lamps, tail and dash lamps, interior lamps, steering-pillar lamps, &c., &c. In addition to these, the new list covers special types of low-voltage lamps for motor-buses, hand-lamps, and general battery service, illumination lamps, and flashlight lamps, for all of which there is a considerable demand. The "automobile" lamps can, of course, be employed for many other purposes, such as for motor-boats, yachts, aeroplanes, airships, carriages, &c. The head-lamps with helical filaments are suitable for all kinds of projection work, and have been used most successfully in magic lanterns and small cinematograph projectors. The arrangement of the helical filament gives a close approximation to the point source of light, which is the ideal for use with a parabolic reflector, when a parallel beam of light is required. All Mazda automobile and battery lamps are rated at 1 watt per c.p., and, owing to the shortness and thickness of the filaments, and the special methods of support employed, can be relied upon to be proof against all the shocks and jars incident to automobile service.

### "EYE-REST" FITTINGS FOR HALF-WATT LAMPS

THE British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), have developed a range of "Eye-Rest" indirect lighting fittings for use with half-watt lamps. Nine types have been developed, consisting of standard metal or moulded composition bowls and suspensions

ADAMS' "EYE REST"  
HALF-WATT FITTING.

CLASSICAL "EYE REST"  
HALF-WATT FITTING.

with the addition of suitable ornamented housings covering the holder and neck of the lamp. Two of the designs are illustrated here. These fittings provide an effective means of adapting the half-watt lamp to interior lighting, and the coming of the Mazda "Half-Watt" lamp, by rendering indirect lighting twice as efficient as formerly, will undoubtedly increase its vogue.

### HALF-WATT LAMPS AT HARRODS

SO far as the half-watt lamp is concerned, Messrs. Harrods, Ltd., take pride of place, in that we understand they are able to boast the first half-watt lamp installation in the United Kingdom. The units employed are half-watt Osram lamps, 100-volt, 500-watt, connected two in series on 200 volts. These are contained in G.E.C. sphere fittings, as shown in the illustration. Each fitting contains one half-watt lamp, and

replaces one of the arc lamps previously used, which were run two in series. The fittings are provided with "Equiluxo" glass spheres. The photograph from which the illustration is reproduced was taken entirely by the light of the half-watt lamps, and gives a good idea of the excellent light distribution obtained. The colour of light as compared with the colour of light from the old arcs is vastly improved, having whiteness without the excess of blue given by the arcs; consequently coloured fabrics are shown to great advantage.

### NEW SIZES OF HALF-WATT LAMPS

A WIDER range of half-watt lamps than has so far been available is now on the market, according to a price-list of "Nitra" half-watt lamps issued by the A.E.G. Electric Co., Ltd. (133-135 Oxford Street, W.). A description of these lamps was given in ELECTRICAL ENGINEERING for January 15th. Two peculiar features are the use of a flint-glass pipless bulb and the method of mechanically fixing the cap to the glass lamp-neck. The full range in which the lamp is now made is:—50-65 volts, 200, 400, 600, and 1,000 c.p.; 100-130 volts, 400, 600, 1,000, 1,500, 2,000, and 3,000 c.p.; 200-260 volts, 1,000, 1,500, 2,000, and 3,000 c.p. The candle-power figures give the mean value measured over the lower hemisphere with the lamp in a clear globe, and without reflector. The 200- and 400-c.p. sizes for 50-65 volts are new, as are the 400- and 600-c.p. sizes for 100-130 volts, and the 1,000- and 1,500-c.p. sizes for 200-260 volts.

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**DISTRIBUTION BOARDS.**—A card from the Metallic Seamless Tube Co., Ltd. (Meta House, Corporation Street, Birmingham), gives particulars of distribution boards in teak and iron cases.

**INSTRUMENTS.**—A new leaflet just published by Crompton and Co., Ltd. (Chelmsford), gives particulars of ammeters and voltmeters of the moving coil and moving iron type in strong pedestal pattern cast-iron cases suitable for mounting direct on iron-clad controlling pillars or angle-iron framework.

**REFLECTORS, &c.**—Krupka & Jacoby, Ltd. (26 to 36 Chapter Street, Westminster, S.W.), have sent us a new leaflet describing several patterns of "Benjamin" opal and steel reflectors, cargo light, and other weatherproof fittings, and shock-proof hand lamps.

### TENDERS INVITED AND PROSPECTIVE BUSINESS

#### Generating Stations, Sub-Stations, Mains, &c.

**Aberdare.**—Transformer, high- and low-tension switchgear, and cables. Town Clerk. February 28th.

**Aberdeen.**—An additional 1,000-kw. La Cour converter is to be installed.

**Barnes.**—Distributor cables. Borough Electrical Engineer. February 20th. (See advertisement on another page.)

**Bexley.**—One 500-kw. turbo-alternator, condensing plant, water-tube boiler, superheated and mechanical stoker. Borough Electrical Engineer. February 25th.

**Carlisle.**—Cables in connection with supply to Scotby.

**Christchurch (N.Z.).**—A loan of £100,000 has been floated for the extension of the electrical plant under the city scheme.

**Cumberland.**—The Whitehaven Hematite Iron & Steel Co., Cleator Moor, has decided to lay down waste heat electric generating plant of 1,000-kw. capacity. As pointed out in a recent issue, the Cumberland Electricity & Power Gas Co.,

For instructions on Cleaning and Polishing  
Electrical Fittings and Electric Cookers, read

### CANNING'S HANDBOOK ON POLISHING, ELECTRO-PLATING & LACQUERING.

Fully Illustrated. Price 2s. 3d. post free. Abroad, 2s. 6d.

whose powers have now lapsed, intended to work upon these lines.

**Dartford.**—A L.G.B. inquiry was held last week concerning a loan of £11,000 for new plant. The scheme of extensions is to instal high-tension plant in order to supply in bulk to the West Kent Electric Power Co. primarily to enable that Company to supply in the Crayford area. The terms are that the agreement shall be for seven years on the basis of a standing charge of £4 5s. per kw. on 350 kw. of plant, with a minimum supply of 1,000,000 units per annum at 0.3d. per unit. In addition, the new plant will enable the Council to deal with the increase in the number of factories now being erected in the Dartford area. There was some opposition to the proposal on the part of the ratepayers, who characterised the scheme as "wholesale gambling with the ratepayers' money."

**Dublin.**—One 210-B.H.P. three-phase E.H.T. motor for use in connection with existing motor-generators at Fleet Street power-house. City Electrical Engineer. March 2nd. (See advertisement on another page.)

**Harrogate.**—The L.G.B. has sanctioned a loan of £7,639 for electrical extensions.

**Ipswich.**—A L.G.B. inquiry was held last week with regard to the following loans:—Mains, £21,000; services, £3,000; motors for hiring, £4,000. The inspector (Mr. H. R. Hooper) and Mr. F. Ayton, the Borough Electrical Engineer, had a little controversy as to the desirability of taking up a loan for motors in preference to purchasing them outright. Mr. Ayton said that it was impossible to go ahead on the latter lines, as in very few cases could the users be induced to purchase the motors.

**Kettering.**—A L.G.B. inquiry was held last week concerning a loan of £12,000 for electrical extensions, of which £2,000 is for mains and services. A new turbo-generator is to be installed.

**Lowestoft.**—A loan of £950 for meters is to be taken up.

**Northampton.**—The Northampton Electric Light & Power Co. is to increase its capital in order to instal new plant.

**Rhyl.**—A L.G.B. inquiry was held last week concerning a loan of £3,900 for electrical extensions.

**Southampton.**—Rotary-converter; balancer; D.C. meters. Borough Electrical Engineer. March 9th. (See advertisement on another page.)

**South Africa.**—H.M. Trade Commissioner for South Africa states that the Paarl, Cape Province, Council will be inviting tenders in South Africa for turbo-alternators, switchgear, transformers, cables, meters, &c. Copy of the specification, &c., may be seen at 73 Basinghall Street, E.C.

**Warrington.**—A L.G.B. inquiry was held last week concerning a loan of £14,550 for extensions at the power station. There was some ratepayers' opposition on the ground that the present charges to consumers are too high.

#### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Beckenham.**—New school, Balgovan Road. Clerk.

**Croydon.**—Nine houses, Albert Road. Maides & Harper, Albert Road.—Cinematograph theatre, London Road, Norbury. H. M. Wakley, 11 Adam Street, E.C.—Six houses, Pollards Hill. H. Elliott, "Rowan," Warwick Road.

**Dudley.**—New town hall and municipal buildings (£40,000).

**Edinburgh.**—Electric lighting installation at South Gray's Close and Fountainbridge washhouses. City Electrical Engineer. February 28th.

Electric lighting at Castle Hill school. Consulting Engineers, Crawford & Cumming, 51 George Street.

**Harrogate.**—New school in Skipton Road.

**Trimdon.**—The Paris Council invites tenders for electric lighting Trimdon Grange and colliery villages. Town Clerk.

#### Miscellaneous

**Brighton.**—Tenders are invited for overhead equipment of railless trolley system, including four double-deck railless cars. Tramway Manager. February 23rd.

**Bolton.**—Twelve months' supply of various stores for Tramways Department. General Manager. February 23rd.

**Great Central Railway.**—Twelve months' supply of electrical fittings, cable, &c. Stores Superintendent, Gorton, Manchester. March 3rd.

**Greece.**—Two electric cranes of 10-tons and 6-tons lifting capacity respectively, for docks at Piraeus. March 28th. President of Harbour Board.

**London: Islington.**—Twelve months' supply of electrical stores for Guardians. Clerk, St. John's Road, Upper Holloway. February 27th.

**H.M. Office of Works.**—Tenders are invited for the execution of electric-bell hangers' work in the London district for

three years. March 12th. (See advertisement on another page.)

**L.C.C.**—Twelve months' supply of electrical stores for the Asylums Committee. Clerk to Committee, 6 Waterloo Place, S.W.

**Macclesfield.**—Twelve months' supply of electrical stores for Cheshire County Asylum.

**Newport (Mon.).**—Twelve months' supply of electrical stores. Clerk, Queen's Hill. March 3rd.

**South Wales.**—The Bedwas Navigation Colliery Co. require a twelve months' supply of electrical stores. March 5th.—Twelve months' supply of electrical stores. Particulars from Manager, Aberaman Offices, and tenders to Powell Duffryn Steam Coal Co., 101 Leadenhall Street, London.

**West Ham.**—The Guardians invite tenders for a twelve months' supply of electrical fittings. Clerk, Union Road, Leytonstone. March 5th.

### TENDERS RECEIVED AND ACCEPTED

**Burnham.**—The tender of the Burnham Electric Light Co. has been accepted at £39 17s. for the electric lighting of the town hall.

**London: L.C.C.**—A tender by the Brush Electrical Engineering Co. at £437 has been accepted for four car traversers at the Abbey Wood car shed extension, and one by the British Westinghouse Co. for electrical equipments at £184.

**Yarmouth.**—Twelve tenders were received for a 600-kw. turbo-alternator, and that of the lowest—The Brush Electrical Engineering Co., at £3,358—has been accepted.

### APPOINTMENTS AND PERSONAL NOTES

A long discussion took place at the Sheffield Corporation meeting on Wednesday last week with regard to a proposal of the Electric Light Committee that the salary of Mr. S. E. Fedden, Manager of the electricity undertaking, should be increased from £800 to £900 per annum, with a further increase of £25 per annum up to £1,000. There was a good deal of opposition, and eventually it was decided to increase Mr. Fedden's salary from £800 to £900 per annum, leaving the further increase for subsequent consideration.

Mr. F. Ayton, Borough Electrical Engineer at Ipswich, has had his salary increased by £100 per annum for the years 1914 and 1915, at which date his present agreement with the Corporation expires. The question of his future salary will presumably then come up for further consideration.

An electrician is required for a large brewery near London. (See advertisement on another page.)

There is a vacancy for an electrical tester in H.M. Dockyard, Devonport. (See advertisement on another page.)

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £67 5s. to £67 15s. (Last week, £68 to £68 10s.)

**Agency.**—George Ellison (Warstone Lane, Birmingham) has appointed Nathan & Allen (Queen Anne's Chambers) as his London agents.

**Liquidations.**—The Kent Electric Power Syndicate is to be wound up voluntarily. Mr. F. A. Walker, 2A Railway Street, Chatham, is liquidator.

**Bankruptcies.**—W. N. Berry and H. Bamber, trading as W. N. Berry & Co., Electrical Engineers, 32 Queen Street, Manchester, have been adjudicated bankrupts.

The first meeting of creditors was held yesterday at the official receiver's offices, Byrom Street, Manchester, and the public examination will take place on February 20th, at 10 a.m. at the Court House, Quay Street, Manchester.

An order has been made for the discharge in bankruptcy of J. G. M. Hilton, Electrical Engineer, 103 Exchange Buildings, Birmingham. Digitized by Google

## LOCAL NOTES

**Ayr: Power Contracts.**—The old question of whether or not it is profitable to enter into large power contracts at low prices has been agitating the minds of several people in Ayr, with the result that Mr. J. F. C. Snell has been called in to advise as to the proposed contracts with two large firms, the terms of which, however, have not been disclosed. Mr. Snell, who is also reporting fully upon the best method of extending the power-house, has expressed himself in agreement with the terms offered in these two contracts.

**Bo'ness: Electricity Works Purchase.**—The Council has the option of taking over the electricity works of the National Electric Construction Co. early next year, and the Company has suggested that if the Council is not desirous of doing so, an arrangement might be made by which the agreement should be renewed for a further twenty or twenty-five years, or alternatively that the undertaking should be handed over to the Company completely. The Council has, however, not agreed to take advantage of the position next year, and has decided to delay consideration of any alteration in the agreement until the next opportunity for purchase, which occurs four years hence.

**Dudley: Electricity Undertaking.**—The Council's electric supply undertaking has now been handed over to the Company whose offer to purchase created so much controversy last year.

**Dundee: Manufacturers' "Combine."**—The Electricity Committee last week discussed the question of the cost of generating plant in relation to the necessity for purchasing converting plant, boilers, and coal-handling machinery for the Carolina Port power-house. The Convener suggested that the Engineer and himself should be empowered to negotiate privately for the plant, as in consequence of the "combine" of manufacturers this was believed to be the cheapest course. It was recalled that some years ago a similar trouble had arisen in connection with cables, and better prices had been obtained for equally efficient cable from the Continent. The suggestion to negotiate privately was agreed to by the Committee.

**Hove: Purchase of Electric Supply Co.**—A loan of £180,000 at 4 per cent. has been taken up with the Liverpool Corporation in connection with the purchase of the Hove Electric Lighting Co.

**Lowestoft: Arc Lamps v. Half-Watt Lamps.**—The Electric Lighting Committee has decided to proceed with a scheme for the installation of ten flame arc lamps for the lighting of the Lower Esplanade, in preference to the adoption of half-watt lamps. This decision was come to on the advice of the Electrical Engineer, who reported that he wished to make experiments as to the life of half-watt lamps before definitely recommending them. In the meantime the old arc lamps on the Esplanade are inefficient, and a change is necessary at once.

**Plymouth: Public Lighting.**—A proposal by the Electricity and Street Lighting Committee to light the Embankment by electricity by means of lamps 100 yds. apart, at a cost of £437, has been referred back for consideration of the comparative cost of electricity and gas.

**Rochdale: Electricity Extensions.**—Some time ago a L.G.B. inquiry was held concerning a loan of £68,500 for electrical extensions, and the Corporation, in anticipation of the necessary consent being given, let provisional tenders. Before granting the loan, however, the L.G.B. has now asked for particulars of the contracts which it is proposed to give and which amount to some £47,000. As all this is considerably delaying the progress of the extension, and the matter is one of extreme urgency owing to the increased demand upon the plant, the L.G.B. has been asked to expedite matters a little.

**Stirling: Proposed Purchase of Electricity Undertaking.**—Mr. George Balfour's offer of £32,000 for the electric lighting undertaking with certain reductions in the charges and the electrification of the existing horse tramways, does not altogether meet with the approval of the Council, which is advised that an electric tramway system can be constructed for £74,000 with a reasonable certainty of financial success.

**Truro: Electric Lighting.**—The Council has been in communication with the Cornwall Electric Power Co. as to terms for a supply in bulk as against setting up its own generating station under the provisional order granted last session.

The Company offered a contract for twenty-one years, but the Council has now asked for terms for a forty-two years' contract with the option of determining it at the expiration of the fifteenth year or any subsequent seventh year.

**Walthamstow: Supply to Woodford.**—Terms have now been arranged with the Woodford Council for giving a supply of electricity in that district.

**Wimbledon: Charges for Power.**—The charge for electricity for power, heating, and cooking purposes in the Maldens and Coombe district has been reduced from 2d. to 1d. per unit.

**Worcester: Rateable Value System.**—The Electricity Committee recommends that a 15 per cent. rateable value system, plus ¾d. per unit, be offered to consumers. There will be a discount of ¼d. per unit if the quarterly charge is paid before the end of the month following each quarter day.

**Wormit: Electric Supply Undertaking.**—A proposal that the Engineer and Manager of the Alloa Electricity Department be engaged to report upon the condition of the Wormit electric lighting plant was passed at the last Council meeting.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &amp;c.

**St. James' & Pall Mall Electric Light Co.**—The ordinary general meeting was held on Tuesday, when the report and accounts were adopted. Mr. W. Leaf, who presided, referred to the fact that Mr. F. J. Walker, the Managing Director and Secretary, has now recovered from his very serious illness. A 12 per cent. dividend on the ordinary shares was sanctioned, as compared with 10 per cent. last year. The amount placed to depreciation is £18,574, compared with £13,500 in 1912. There are at present in hand plant extensions involving a capital expenditure of about £60,000.

**London Electric Supply Corporation.**—The dividend on the ordinary shares for 1913 is increased from 2½ to 3 per cent., as compared with 1912.

**Yorkshire Electric Power Co.**—At the meeting on Tuesday the report and accounts given in our last issue were adopted. The Chairman, Mr. A. G. Lupton, pointed out that the profit for last year was sufficient to pay a small dividend on the ordinary shares, but in view of the rapid growth of the Company, and of the need to deal with the second mortgages on the undertaking, the directors considered this would be unwise. Dealing with the Company's Bill which is to come before Parliament this session, special reference was made to Clause 3, which enables the Company to supply in detail in districts where there is at present no electric lighting provisional order. He explained that the object of this is merely to give such districts a supply of electricity without in any way prejudicing the rights of the local councils to take out provisional orders subsequently, if they desire to do so. In only a few cases are these small local councils opposing, but for some reason the larger corporations have petitioned on this particular clause, notwithstanding the fact that it does not apply to them, as they already have special protection under the Company's previous Acts.

**Electrical Distribution of Yorkshire.**—A 6 per cent. dividend on the ordinary shares is recommended for 1913, after adding £1,000 to reserve, the carry forward being £636. Two additional provisional orders have been acquired during the year.

**Mather & Platt.**—The net profits for 1913 were £164,524, and a dividend at the rate of 10 per cent. per annum is recommended on the ordinary shares, together with a bonus of 5 per cent., both free of tax. £50,000 have been transferred to reserve, and £40,030 carried forward.

**W. T. Henley's Telegraph Works.**—A dividend of 15 per cent. on the ordinary shares has been recommended for 1913, in addition to a bonus of 5s. per share.

**Ascot District Gas and Electricity Co.**—A dividend at the rate of 6 per cent. for the December half-year is declared, after setting aside £300 for reserve and carrying forward £1,045.

**Companies Struck Off Register.**—The following have been struck off the register of joint stock companies: Electric Power Plants; Titan Electric Co.

## SUMMARY

NOTICE of several motions to reject the London Electric Supply Bill on second reading in the House of Commons has been given. The L.C.C. petition against the Bill also seeks the rejection of it entirely. (Page 112.)

AN illustrated description of the Siemens automatic telephone exchange system contains particular reference to an equipment at King's College Hospital, and reference is also made to the 121-dial electric clock system there. (Page 113.)

ELECTRIC welding was discussed at a recent meeting of the Institution of Mechanical Engineers, when Mr. T. T. Heaton read a Paper describing a number of systems of welding. (Page 114.)

A PAPER by Mr. T. Ferguson, read before the Manchester and Birmingham Local Sections of the Institution of Electrical Engineers, described the leading features of several electric train-lighting systems. (Page 115.)

A REPORT recently issued by the International Electrotechnical Commission contains the recommendations regarding the standardisation of symbols agreed to at the Berlin Congress. (Page 115.)

THE advantages and disadvantages of the magnetite arc lamp are discussed in our Questions and Answers columns. (Page 116.)

A NUMBER of interesting points regarding the control equipment of electric locomotives were raised by Mr.

F. Lydall in his Institution Paper read at Birmingham last night, and to be discussed in London to-day. Two Papers, read at the last meeting of the Institution of Civil Engineers, on electric railway matters, one by Mr. W. Willox on rail steels, and the other by Mr. S. Sellon on corrugation. (Page 117.)

A FURTHER delay in the hearing of the action for infringement of the Marconi patent No. 7,777 of 1900, brought by the Marconi Co. against the Helsby Wireless Telegraph Co., will result from the application by the Helsby Co. in court on Monday, under a section of the Patents Act, for the appointment of an "assessor" to help the judge on technical matters. Who the assessor will be is not yet announced. (Page 117.)

A PATENT by A. Muirhead and R. H. Edgar, relating to the construction of siphon-recorders, expires during the current week after a full life. The specification of a Siemens' Patent of 1904 for the manufacture of drawn-wire filaments has been amended. Among the specifications published by the Patent Office last week is one by the B.T.-H. Co. dealing with the preparation of tungsten, suitable for use in the manufacture of drawn filaments. Two other specifications deal with wireless transmitting circuits, in which rotary disc dischargers and "split" and working condensers are used. These patents are in the name of G. Marconi. Another important patent, by W. Rübel, is for a soft good dynamo iron, containing aluminium and silicon. (Page 118.)

A PAPER by Mr. J. C. Hutton read recently in Wolverhampton outlines the principal features of the various dynamo systems of lighting motor-cars. (Page 119.)

NEW examples of fittings for half-watt lamps and examples of installations of these lamps are illustrated in our Trade Section, which also contains descriptions of an electric pump and some accessories for conduit wiring. (Pages 119 to 122.)

NEW generating plant or cable is required at Basingstoke, Burton-on-Trent, Bexhill, Rotherham, and by the Lancashire & Yorkshire Railway Co. Electrical stores, including meters, cable, arc lamp carbons, &c., are required by a number of municipal electric supply departments. (Page 123.)

THE Hornsey Council is only prepared to support the I.M.E.A. Bill if wiring work is carried out through contractors.—Many hired radiators have been returned at Southampton since the charge was increased.—Large sums are to be taken from electricity profits for relief of rates at Brighton and Swansea against the wishes of the Electricity Committees. (Page 124.)

SATISFACTORY results for 1913 are shown by Bruce Peebles & Co., W. T. Glover & Co., and the British Electric Transformer Co. A 10 per cent. dividend is recommended by the latter. (Page 124.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, FEBRUARY 26TH.

*Institution of Electrical Engineers.*

8 p.m. "Motor and Control Equipments for Electric Locomotives," by F. Lydall. The same author's previous Paper on Electric Locomotives will also be discussed.

FRIDAY, FEBRUARY 27TH.

*Institution of Electrical Engineers: Manchester Section.*

7 to 7.15 p.m. Annual Dinner at Midland Hotel.

SATURDAY, FEBRUARY 28TH.

*Royal Institution.*

3 p.m. Afternoon lecture, I., by Prof. Sir J. J. Thomson, F.R.S., on "Recent Discoveries in Physical Science."

*Association of Mining Electrical Engineers.*

5.30 p.m. Warwickshire and S. Staffs branch. At Imperial Hotel, Birmingham. "Design and Maintenance of Miners' Electric Lamps," by F. J. Turquand.

TUESDAY, MARCH 3RD.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal School of Technology. "The Possibilities of Electric Traction on Railways," by J. L. Moffett.

*Institution of Electrical Engineers: Scottish Students' Section.*

7.30 p.m. At Royal Technical College, Glasgow. "The Maintenance and Repair of D.C. Plant," by H. A. Stewart.

*Wireless Society of London.*

8 p.m. At Institution of Electrical Engineers. Debates on "The Design of Receiving Apparatus with Particular Respect to the Size of Coils and the Nature of their Winding," and "The Relative Importance of Constructional Features of Telephones."

WEDNESDAY, MARCH 4TH.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. At Victoria Embankment. Discussions on "Synchronous Motors v. Induction Motors" and "The Prospects of Electrical Engineers."

## The London Electrical Engineers.

46 Regency Street, S.W.

*Rating Exam.* for all Cos. from 7 to 10 p.m. every Wednesday.

(TO-DAY) THURSDAY, FEB. 26TH, C. Co. FRIDAY, FEB. 27TH, D. Co. MONDAY, MARCH 2ND, A. Co. TUESDAY, MARCH 3RD, B. Co., Tech. Inst., 7 to 10 p.m., Min. Range Practice, 7 to 9 p.m. WEDNESDAY MARCH 4TH.—Recruits. Infantry Drill, 7 to 8 p.m. Tech. Inst., 8 to 10 p.m.

## ELECTRICITY SUPPLY IN LONDON

THE London Electric Supply Bill was down for second reading in the House of Commons on Monday, but has been deferred until Monday next. It is interesting to note that notices have been given to move on the second reading that the Bill be read a second time "upon this day six months," by Mr. Lough, Mr. Radford, Mr. Wiles, Mr. Dickinson, Sir Stephen Collins, and Dr. C. Addison, all of whom are Metropolitan Members.

The Parliamentary Committee of the London County Council has reported with regard to the Bill. After briefly setting out the present position with regard to the London electric supply companies, and the object of the Bill, the petition which the Council has lodged against the Bill is outlined. This points out that the Council is fully alive to the complications and difficulties now existing in regard to electricity supply in London, and the importance of the option of purchase vested in it by the London Electric Supply Acts, 1908 and 1910; that with a view to determining as to the best course to be adopted, the Council has appointed a special committee to consider the whole subject; that the committee, with the assistance of eminent expert advice, has already devoted much time and attention to the question, but have not completed their inquiries and are not yet in a position to submit the result of their deliberations to the Council. The petition further states that the Council is at present unable to determine whether or not it will be necessary to place before Parliament proposals for further legislation on the subject, and that it objects strongly to the grant in the meantime of any further powers such as those proposed in the Bill. It is also pointed out that the Bill, if allowed to become law, may prejudice the Council in any negotiations which it may have to undertake as the result of its investigations, and militate against a complete and satisfactory settlement of the important questions now under consideration.

The conference of London Borough Councils, to which we referred in our last issue, has passed a resolution protesting against the Bill unless guarantees be given to municipal undertakings that no action will be taken, apparently by the L.C.C., in connection with loans which will prejudice the development of these undertakings. The resolution also objects to the Bill on the ground that it may enhance the value of the companies undertakings to such an extent that their purchase subsequently will be commercially prohibitive. It is further recommended that the Bill should be opposed by every possible means, and failing a *locus standi* to appear before committees, the local Members of Parliament should be asked to oppose the Bill in the House of Commons. As we have already pointed out, a number of London Members of Parliament have fallen in with this view.

## THE LIGHTING OF PICTURE GALLERIES

AT a meeting of the Illuminating Engineering Society on Tuesday, February 17th, a discussion was opened by Prof. Silvanus Thompson, F.R.S., on the lighting of picture galleries and art studios. His remarks dealt at some length first with daylight illumination, and in turning to artificial lighting he emphasised that an arrangement of lamps which might be good for general illumination was not one which could be adopted for lighting particular pictures. Lamps should be screened, so that there were no interfering reflections from the glass or varnish of the pictures, and must not shine directly in the eyes so as to interfere with the proper viewing of the pictures. Indirect lighting was the extremist way of solving the problem, but although admirable for some purposes, he did not consider it satisfactory in all cases for an art gallery. There always seemed to him to be something wanting if the lighting was only indirect, especially in sculpture galleries, where a great part of the beauty and effect depended on the shadows. In general, lamps in picture galleries and studios ought to be placed so that the main direction of the light was the same as by daylight. The speaker then referred to the great difficulty in obtaining true colour effects by artificial light. The greatest step in advance had been by tungsten filament lamps in special bluish glass globes. Green was the hardest colour to deal with. Mr. A. P. Trotter agreed that artificial and natural lighting should come from the same directions, but in cases where the positions of the windows were bad, the lamps should be arranged to give a better effect. The greatest complexity was given to the colour-matching problem by the fact that daylight itself varied so much. He had done some experimenting on coloured glass screens with the spectroscope, and hoped eventually to find a glass that could be made not only in globes, but in sheets, which would give a better approximation to daylight than could be produced at present. Mr. David Murray, R.A., said that the bluish lamp gave a "fictitious beauty," and Mr. Joseph Pennell characterised them as "nothing but tricks." The latter speaker described a system in use at the Louvre and in Venice, where lamps were mounted at the top of a screen which served primarily to adjust the daylight illumination. The effect was a similar distribution as in the daytime. Mr. V. A. H. Mackinney had paid much attention to the problem of getting uniform or definitely graduated illumination over a surface, and showed screens for the purpose. Mr. Percy Rigland referred to experiments with metal reflectors, but none had given such good results in his studio as whitened canvas. Mr. Thornton referred to the possibilities opened up by intentional inequality in the individual lighting of pictures. Mr. Bush said that cornice lighting should not be confused with indirect lighting from fixtures. With the former, when looking at the higher pictures, there was a tendency for the eye to catch the brightly lighted cornice, with the result that the pupil would close and the picture would not be seen properly, whereas this objection did not occur to the same extent with indirect lighting from fixtures in the centre of the room or behind the observer. He described an installation in America where a long trough was used all along the exhibition with provision for fixing lamps at any point, so that every picture could be treated separately. Mr. Justus Eck deprecated light coming from too many directions at once for viewing statuary. Mr. T. Ritchie, in speaking of colour screens, said that the falling off in efficiency caused by their use was not sufficiently realised. Prof. Thompson, in his reply, referred to the fact that incandescent lamps in coloured bulbs, to give a light approximating to daylight, were now articles of commerce.

## THE SIEMENS AUTOMATIC TELEPHONE SYSTEM

(With Particular Reference to the Telephones and Electric Clocks at King's College Hospital)

WE have had an opportunity of inspecting two examples of Siemens automatic telephone exchanges—one at Messrs. Siemens Bros. & Co.'s own works at Woolwich, and the other at King's College Hospital, Denmark Hill. The now well-known finger-plate dial is used on the subscriber's instrument, and the action of taking the receiver off the hook actuates a pre-selector in the exchange, which connects a free selector circuit to the subscriber's line; the selector connects the line to the connector of the hundred group required, and this is operated by the impulses sent by the calling subscriber, and selects the wanted subscriber's line or the "busy" tone contact. In larger exchanges, of course, intermediate selectors are used, and in smaller exchanges the selector is dispensed with altogether (up to 100 lines), or is replaced by a fifteen-line selector or "discriminator" (up to 200 lines). A pre-selector for ten selector lines is shown in Fig. 1; similar ones are made with contacts for fifteen to twenty-five lines. The arms holding the three sets of wipers are rotated over the contacts by means of a ratchet and pawl worked by an electro-magnet, which receives impulses at the rate of fifty per

magnet for rotating the wiper shaft. At the close of the conversation, the release magnet is operated when the subscriber hangs up, and this allows the wiper shaft to drop to its normal position by gravity. The selectors are similar in appearance to the connectors.

The 200-line exchange of this type has been working satisfactorily at Messrs. Siemens' works for about two years to connect up the various departments, and we were also shown

FIG. 1.—THE PRE-SELECTOR.

second from an interrupter or a small A.C. machine as soon as the subscriber removes his receiver and actuates the line relay connected to the pre-selector. As soon as the wipers reach a free selector circuit, current is cut off from the driving magnet, and the pre-selector remains in that position until the subscriber hangs up. As soon as this happens, the driving magnet circuit is again completed and the wiper arm continues its travel to the end of the segment of contacts until it reaches the "off" position. It will be seen in Fig. 1 that there are three arms, each carrying a set of three wipers, and the next one is then ready to be moved on by the driving magnet when another call is received. The design of this pre-selector is the chief feature of the system; it is simple, and there is little in it which can get out of adjustment. Fig. 2 shows the design of the connector. The two bottom banks of contacts are each fitted with five levels of ten contacts each, making 100 in all, for the subscriber's line multiple, and the top bank has ten levels of ten contacts for the corresponding test circuits. The magnet to the right in the upper part of the illustration is the lifting magnet, next to this is the release magnet, and below the latter are seen the two coils of the

FIG. 2.—THE CONNECTOR.

a neat board consisting of hinged racks fitted in a cupboard with dust-proof shutters, which the firm is shortly introducing for 25 to 50-line village exchanges. In the latter the whole of the connections are made by simple switches of the pre-selector type, which are worked by primary batteries.

The automatic exchange at King's College Hospital has an ultimate capacity of 150 lines, of which ninety are at present working. To save current, the motor-driven interrupter for the pre-selectors is only in operation when a call is in progress. As soon as the telephone of any station is taken off its switch-hook, the motor is started automatically by a relay. The exchange occupies very little space and the

racks are placed at 3 ft. centres. Current is provided by two small 60-volt batteries, which are charged from the Hospital's electric lighting plant.

Reference may be made here to the wiring arrangements in connection with the telephones, bells, annunciator boards, and clocks at King's College Hospital, although they are not necessarily a part of every automatic telephone installation erected by Messrs. Siemens. Multiple cables with 10-lb. conductors and twin cables with  $12\frac{1}{2}$  lb. conductors are employed. The copper wires are enamel-insulated, then covered with paper saturated with

FIG. 3.—DISTRIBUTING BOX: TOP COVER REMOVED.

beeswax and lead-sheathed. All the circuits (telephones, bells, and clocks, with ample provision of spares) run together to a main board, with a capacity for 600 pairs, in a central part of the building, and are connected up by cross-connecting wires neatly arranged. From this main board multiple cables are taken to distributing boxes outside the building. Fig. 3 is a view of one of these boxes with the top cover removed to show the terminals and the inlets for the twin wires, and Fig. 4 is a section of a smaller box, which explains the method of connection. The twin wires to the instruments are led in through the window frames, and are buried under the plaster in the room—a thing much to be desired in hospital work to prevent possible

FIG. 4.—SECTION OF DISTRIBUTING BOX.

accumulation of dust. These wires run straight to the instruments; there are neither pot-heads nor window terminals.

The electric clocks are an interesting feature of the installation. There are in all 122 clocks. A master clock is placed in the telephone switchroom, and sends out impulses once a minute to the remaining clocks, which are of high resistance (2,400 ohms each) and connected in parallel. The master clock is electrically wound, and the winding gear is operated every minute, but the winding magnet is so wound that it fails to operate, due to low voltage of the battery, long before the secondary clocks. It does not stop, however, as it is a two-day clock; but the weight descends in the ordinary way, and after two minutes a warning bell circuit is closed and the batteries can be recharged before the secondary clocks cease to operate. The clocks are worked at 26 volts from the same battery as the telephones. They

are grouped in sets of seven on a circuit, and each circuit starts from the switchroom and is protected there by a fuse. An impulse counter, similar to a telephone meter, is connected across each circuit there, and if any circuit is out of order this is seen by the reading on its counter being different to that of the others. When the circuit is put in order again, the clocks on it are reset from the switchroom by a key which is pressed to send impulses to the circuit in question until the counter shows the same reading as the others.

The whole installation at King's College Hospital was erected under the supervision of the Consulting Engineers, Messrs. Kirkland & Capper, and the architect, Mr. W. A. Fite.

## ELECTRIC WELDING

A PAPER entitled "Some Modern Methods of Welding," by Mr. T. T. Heaton, was read before the Institution of Mechanical Engineers on February 20th. The author commenced by summarising the chief features of the leading electrical systems. In the Benardos arc system, which uses continuous current at about 90 volts from a special compound-wound generator, the work itself forms the positive pole of the arc, and a rod of carbon in an insulated holder in the hand of the operator is the negative pole. Several arcs, each carrying 200 to 500 amperes, can be worked off one machine in parallel. In the Zerener method, the two carbons are in the same holder, and a magnet deflects the arc towards the work. In the Strohmer-Slaughter system, which can be worked by alternating current, the parts to be welded are placed in juxtaposition, and an electrode, consisting of a soft iron rod covered except at the ends with a flux, is laid along the welding line. Contact is made between the work and one end of the electrode, which fuses by a series of arcs along the welding line, melting the electrode into the work and coating the weld with a vitreous flux which prevents oxidation, but flakes off when the metal cools. Another class of system is electric contact welding, where the pieces to be welded are pressed together in a special machine, and an alternating current with a density of 16,000 to 20,000 amperes per sq. in. at 2 to 4 volts is passed through the joint, and the parts pressed further together. A similar method with rather lower currents is employed in "spot" and "roller" welding. In the former, which is for sheet and similar work, the work is laid upon a fixed copper contact piece and a movable electrode is pressed immediately over it. Current is then switched on, and, in passing through the work, heats it and makes the weld. A series of such spot welds, like a row of rivets, can be made practically continuous by the spots overlapping one another. In the roller system, the work travels between electrodes in the form of rollers, and a continuously welded line is produced. In the Pontelac modification of the spot system, a small metal disc is placed between the pieces to be welded, and is crushed into the weld. It is claimed that the heat is better concentrated by this method.

The author then outlined the procedure in oxygen gas blow-pipe welding, and in comparing the various systems said that he regarded electric arc welding and oxy-acetylene welding as the two systems most suitable for general application and the rest for special work. For some classes of work arc welding was superior, but for thin work there was more risk of running the metal by the arc owing to its higher temperature, which was about 7,500° F. against 6,000° F. of the oxy-acetylene flame. In his opinion electric heat must be more effective because it was produced within the work itself, whereas the heat of the gas flame was applied entirely from outside. Where the work was suitable arc welds could be made much more quickly than acetylene welds. Arc welding was used successfully for filling up blow-holes, &c., in steel castings. It was wrong to say that electric welding hardened the metal by filling it with carbon from the electrode. On the contrary, the arc burned out all impurities, including carbon, and left purer iron in the weld. A large number of cases of welded work were described and illustrated in the Paper.

Mr. G. N. Shawcross, in the discussion, said that many people would have tried contact welding to a greater extent if it did not require a special single phase circuit. Mr. T. Clarkson had been disappointed with the results of oxy-acetylene welding, and mentioned the Thermit process as having the same advantage as the electric resistance method in that the temperature was gradually brought up to the welding point when the two pieces of metal were forced together. The electric resistance method was, in his opinion, the best, the most controllable, the least

likely to injure the material, and gave the most uniformly satisfactory results. Mr. D. Richardson and Mr. A. Wechsler defended the acetylene process, and the former thought that there was a loss of mechanical properties in electrically welded joints. Mr. B. J. N. Willcox had not been very successful with the Benardos process for marine repairs, but spoke highly of a modification of the method worked by the Anglo-Swedish Co., in which a pencil of pure iron was used instead of the movable carbon electrode. He had used this with great success on large boiler work. Mr. E. Adler (A.E.G. Electric Co.) spoke of the use of special constant-current generators for portable Benardos apparatus, and with regard to resistance welding said that this was primarily introduced for the welding of materials to edges and cross-sections particularly in copper. The system had made great advances in the Birmingham district for motor bicycle and similar parts and outfits, for 200 to 300 kw. were now made for welding railway points, switches, and other heavy work. Mr. W. H. Patchell mentioned a rail welding system with a carbon negative pole used by the Tudor Accumulator Co., and said that the beauty of the resistance method was that it did not put anything into the weld. He believed that copper had been welded by the resistance method before iron was tackled, and that some of the cable-makers had been making copper joints by that system for many years.

### TRAIN LIGHTING

A PAPER on Electric Train-Lighting Systems, by Mr. T. Ferguson, was read at a meeting of the Manchester Local Section of the Institution of Electrical Engineers on January 27th, and was also discussed by the Birmingham Local Section on the following day. The author quoted the remarks of Major Pringle after the Aisgill disaster, when he urged upon railway companies the desirability of employing electricity as their standard illumination. The simplest method was the "head on" system practised to a limited extent in America, where a small generating plant is carried on the locomotive, and mains are run along every vehicle. This, however, entailed disadvantages which were overcome by the systems with axle-driven dynamos, batteries, and regulating gear, with the coaches either forming individual units or made up into block trains with one lighting plant. Mr. Ferguson outlined some of the conditions that should be met by a good system, and discussed generally the *pros* and *cons* of the single and double battery systems, the latter of which is largely used to overcome the difficulty of the difference between the charging and lamp voltages, but is expensive to instal and to maintain, as well as less efficient than the single battery system. In his opinion, "single-battery systems will have to be much more universally adopted in the future if electric train lighting is to make the progress that is expected of it, as by reducing the number of cells the maintenance and depreciation costs of the equipment are certainly decreased by 25 to 30 per cent." The regulation could be such that the battery is charged either at constant current or at constant voltage. Each system possessed merits, but it would appear that the constant-current system was the more popular; and most of the systems employ a rising characteristic for charging. "Even if constant current represents the extreme of this rising voltage characteristic," writes the author, "yet its simplicity, ease of adjustment, independence of fine adjustment, and faculty for de-sulphating faulty batteries, commend it to the practical railway-lighting engineer, who can feel some confidence that even should the regulation of the dynamo or special regulator become somewhat coarse through unavoidable defects or rough handling, the working of the system will not be very much impaired."

The Paper describes several typical systems in general use. The well-known Stone system has the dynamo so hung that it keeps a practically constant belt tension, so that the voltage of the dynamo is determined by the battery, hence the current cannot increase above a definite amount, or the belt would slip. In other words, the speed of the dynamo does not rise above full-load speed, however much higher is the speed at which the belt runs. In this system the cut-in and cut-out switches are worked by a centrifugal governor. The Leeds Forge Co.'s system also belongs to the "constant current" class, and accomplishes its regulation by the torque required to drive the armature. As the speed increases, the driving torque serves, by means of a cam, to thrust the armature bodily along its shaft in an axial direction from its normal position in the field, the thrust being resisted by a suitable spring. The armature is mounted upon a sleeve which is free to slide on the driving shaft; and it is driven by a pin on the sleeve provided with a roller that works in a spiral cam-shaped groove cut in the shaft. This pin, when the shaft is rotating, bears against the side of the slot and so causes the armature to rotate with the shaft.

Mather & Platt adopt what is practically a constant-current system and use Dr. Rosenberg's self-regulating generator. They usually employ the double-battery method. Another constant-

current example is the "D.L." system of the Consolidated Lighting & Heat Co., U.S.A., adopted by Vicars, Limited. The dynamo is shunt-wound, and when the direction of motion is reversed the polarity is maintained by a reversing brush rocker. The current is kept constant by a solenoid-operated automatic rheostat. A single battery is used, and the difference between the dynamo and lamp voltages is taken care of by another solenoid-operated automatic rheostat. The next system to be described was that of the Tudor Accumulator Co., which is also a single-battery system on the constant-current principle. Particulars of this appeared in *ELECTRICAL ENGINEERING*, Jan. 22nd, page 50. The Silvertown system is a double-battery system more or less similar to the Stone system, except that regulation is not accomplished by the slipping of the belt, but by reverse-compounding coils, which carry the charging current to the battery. A series diverter is provided to adjust the output of the dynamo in the usual way. The switches are operated by a centrifugal governor.

Messrs. Brown, Boveri & Co. adapt their well-known voltage regulator for use with their train-lighting system. The main point in their arrangement is that they provide compound windings on their regulator, so that the battery charging-voltage is not held constant, but gradually rises as the battery becomes charged. The Dalziel system in its latest form employs a special exciter on the dynamo shaft for voltage regulation, and is also a pure constant-voltage system. In another, the Grob constant-voltage system, the dynamo rises at the same voltage as the lamps, and the battery receives its current through a booster.

### THE STANDARDISATION OF SYMBOLS

THE report of the International Electrotechnical Commission on symbols for use in electrotechnics has now been published, and contains the decisions arrived at at the Berlin meeting of the Commission, when delegates from twenty-four nations were present. A certain number of rules of principle relating to electrotechnical symbols generally are given, together with a list of thirty-six symbols. A number of signs for the names of units and a few mathematical rules and symbols commonly employed by electricians are also included. The complete report is obtainable for 2s. 1d., post free. It is noticeable that the Commission desires to avoid the use of Gothic type, and confusion between Roman and italic characters. Instantaneous values are to be represented by small letters, and initial or constant values by capitals. Maximum values are to be distinguished by the suffix *m*, and Greek letters are to be reserved for angles and dimensionless or specific quantities. Script letters are only to be employed for magnetic quantities. Among the symbols to which attention may be drawn are the proposed use of *A*, *W*, and *P* respectively for work, energy, and power; and  $\omega$  for  $\frac{2\pi}{T}$  (where  $\tau$ =period); *D* for electrostatic flux

density, and *X*, *Z*, and *S* respectively for reactance, impedance, and reluctance. Intensity of magnetisation is to be denoted by *J*, as *I* is already appropriated for current. We are forbidden to use our old friend  $\Omega$  for the megohm, and instructed to write *kW* instead of *kw*. for kilowatts. It should also be mentioned that the Commission will recommend the International Congress on the Applications of Electricity, to be held in San Francisco in 1915, to adopt the name "Siemens" for the unit of conductance.

**The Electrical Trades' Benevolent Institution.**—Sir David Salomons has accepted the position of President of this Institution, which became vacant on the death of Sir William Preece. The year-book of the Institution has just been published, containing the Committee's report and accounts, and reports of the annual meeting and festival dinner, together with lists of subscribers, &c. The progress last year appears to have been satisfactory, and the total amount now invested is £4,920. A larger sum was invested during last year than in any previous year. The total of subscriptions, donations, and other sources of income was £1,362. Grants were made amounting to £153, and expenses absorbed £247.

**The Old Centralians.**—The annual dinner held on Saturday last was very successful. Dr. Moody, the President, proposed the toast of "The College," which was replied to by Prof. W. E. Dalby. Mr. G. S. Lamert toasted the "Old Centralians," and Mr. Maurice Solomon responded. Prof. M. O. Forster gave the health of the guests, and Mr. H. Hirst acknowledged this on their behalf. Short speeches were also insisted on from Prof. Armstrong and Prof. Unwin, who were present.

**Wolverhampton and District Engineering Society.**—At a meeting of this Society on Friday last, Mr. C. E. C. Shawfield, the Chairman, gave his Presidential Address on Electricity and Gas, and Mr. F. S. Grogan (British Electric Transformer Co.) gave a lecture and demonstration entitled, "The Cooking Problem—Why Electricity is Winning," which was followed by a discussion opened by Mr. S. T. Allen, Borough Electrical Engineer, Wolverhampton.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,380.

How does the rating of pipe ventilated motors compare with that of totally and semi-enclosed machines? In the smaller sizes, say 10 h.p. at speeds from 600 to 1,000 r.p.m., how is the air circulation effected?—"E. W. A."

(Replies must be received not later than first post, Thursday, March 5th.)

### ANSWERS TO No. 1,378.

What are the salient features of the magnetite arc lamp, and why does it not find so much favour in this country as in U.S.A.?—"KINK."

The first award (10s.) is given to "T. H. S." for the following reply:—

The magnetite arc was developed by Dr. Steinmetz, and consisted in its original form of an arc burning between a positive electrode of copper and a negative electrode of magnetite (ferric oxide), titanium oxide, and chromium oxide. The light comes from the arc itself, as in the flame arc, though it is believed that a projection of electrons takes place, instead of volatilisation of material, as in the flame arc. In order to take advantage of the luminous tip on the negative electrode in the later developments, this electrode was placed above the copper, instead of the reverse arrangement in the earlier form of arc. This necessitated a composite positive electrode, so that the arc should not be interrupted by a non-conducting layer of copper oxide; better ventilation had also to be provided to remove oxides thrown on to the upper electrode. The functions of the three oxides in the negative electrode are as follows: The titanium oxide is the main light-producer. The magnetite makes the mixture a conductor when cold. The chromium oxide retards the volatilisation of the other constituents, similar to the carbon powder in the core of a flame-cored or ordinary-cored carbon. The oxides are mixed and compressed in thin iron tubes. The arc is practically white, and is usually long, about 1 in. The arc volts may be 60/85. The candle-power is of the order of 250 to 400 at 0.6 to 0.8 watts per candle.

The characteristic curves are similar to those of the ordinary open-type arc. An equation:—

$$V = 33 + 24.5l + \frac{25 + 140l}{A}$$

where  $V$  = volts,  $A$  = amperes,  $l$  = length in mm., has been determined, which is similar to that found for ordinary carbons by Mrs. Ayrton.

The great advantage of the magnetite arc is the long life

of the electrodes, which do not, of course, burn in the air. It is for this reason that it finds favour in the United States, where labour is dear, and arc lamps are often placed at long distances apart, which renders continual trimming a disadvantage. Formerly the enclosed arc was much used in America; but the magnetite arc has a much better efficiency and a longer life—approximately 150 hours against 100 hours of the enclosed lamp. In this country, where labour is cheaper and arc lamps mostly crowded together in towns, the still more efficient flame arc is usually preferred.

The second award (5s.) is given to "E. V. A.," whose reply is given in slightly condensed form below:—

The magnetite lamp is suitable for the lighting of large open spaces where a cheap general illumination is required. It is a metallic arc burning pure commercial copper of large section (about  $1\frac{1}{4}$  in. diameter by 3 in.) for the positive electrode and black oxide of iron and titanium in the form of fine powder for the negative. This is rammed into a steel tube which burns away with the mixture. At 4 amperes the copper electrode lasts about 6,000 hours and the lower (magnetite stick) 200 hours, so that it is only necessary to insert a new negative at each trim. The light given is pure white, and, in the writer's opinion, is of greater value than flame lamps in sidings where coloured signals have to be distinguished, and on slag tips, as red-hot slag shows up more readily. The illumination curve is flat, with the maximum illumination about  $11^\circ$  below the horizontal. The lamp is provided with a central flue to carry off the fumes and to ventilate the globe.

Magnetite lamps operate at practically the same current and arc voltage as enclosed lamps, which they can replace without alteration of the wiring. Only one globe is required and the electrodes are unbreakable. This is an important feature in places where lamps are roughly handled. The reason that the lamps are not put in in great numbers in this country is on account of the quivering of the arc on low voltages. The writer states, however, that this unsteadiness is not noticed when more than one lamp is installed. These lamps are popular in the United States, where the long-series system is almost universal. When run in series of 25 or 50, the arc is much more tenacious and steady than when run singly on 100 volts, or two in series on 200 volts.

A good reply has also been received from "M. M.," who gives the dimensions of the magnetite electrode as  $\frac{3}{8}$  in. diam. by 8 in. long, and insists more strongly than those above on the disadvantage of the fumes given off which necessitates thorough cleaning at every trim. The reply sent in by "Marp" may also be mentioned with commendation. In addition to summarising several points already mentioned, he points out that the lamp can only be used on continuous current circuits.

**Leeds Dinner of the I.E.E.**—A good number of members and friends were present last Friday at the dinner of the Yorkshire section of the Institution of Electrical Engineers, presided over by Mr. W. B. Woodhouse, chairman of the section. The speeches were of an optimistic character. Mr. A. G. Lupton, in proposing the Institution, referred to the remarkable social and commercial changes brought about by the development of the electrical industry. Mr. R. Hammond, in following the president in acknowledging the toast, alluded to a recent visit he had made to South Africa, and urged that every coal mine in Yorkshire should follow the example set by the gold mines in the Rand, and adopt electric winding. Out of 60 of the Rand mines, 48 were worked electrically, and half of them had electric winding installations. The chairman, in proposing "Our Guests," remarked that co-operation between the chemist and the electrical engineer would enable coal and agriculture to be brought together. It would get rid of that bane of agriculture—smoke—and would provide a useful and economical source of power for all farming operations. Prof. Charnock, in giving "The Electrical Industries," predicted that in the near future we might look for some interesting developments in regard to the utilisation of waste gases and electrification of railways. Mr. H. H. Wright, vice-chairman of the section, responded.

**International Electrical Congress.**—The following British engineers have been appointed honorary members of the International Committee on Congress Organisation in connection with the International Electrical Congress which is to be held in San Francisco next September: Mr. W. Duddell, Mr. A. Siemens, Dr. W. T. Glazebrook, Col. R. E. Crompton, Mr. C. le Maistre, Lord Rayleigh, Dr. G. Kapp, Sir J. J. Thomson, Dr. S. P. Thompson, Mr. W. M. Mordey, Dr. J. A. Fleming, Sir Charles Parsons, Sir Oliver Lodge, and Dr. S. Z. de Ferranti.

## ELECTRIC TRACTION NOTES

The Paper by Mr. F. Lydall on "Motor and Control Equipments for Electric Locomotives," read before the Birmingham Local Section of the Institution of Electrical Engineers last night, and to be discussed at to-night's London meeting, is supplementary to his previous Paper on electric locomotives already published in this Journal (see *ELECTRICAL ENGINEERING*, November 13th, 1913), with which it will be discussed. Dealing first with motor equipment, the author pointed out the influence on the motor capacity of gauge, electrical system, voltage, method of transmission, and forced ventilation. The restrictions of gauge were of less importance with coupling-rod drive than with geared motors; polyphase motors made a good showing as regards size for their power, but single-phase motors were undoubtedly more bulky than those for continuous current; forced ventilation resulted in a great gain in output. Turning to control equipment, Mr. Lydall showed how the difference in the ratio of adhesion weight to total weight in locomotives, as compared to motor-cars, had a marked influence on the control system. If the steps were too far apart, skidding might take place and prevent the next being reached, especially when starting on gradients. The number of steps required depended on the torque speed characteristic of the motor. The irregularity in effort due to the controller steps could be got rid of by applying a continuously varying voltage from a motor-generator with D.C., or an induction regulator with A.C. The latter could be comparatively small, and being interlocked with the controller, could simply bridge over the gaps between the auto-transformer tapplings. There was sometimes difficulty in avoiding shock in passing from series to parallel, but this was largely obviated by the bridge system, which was, however, difficult of application with more than two motors. More resistance steps were required with the series than with the parallel connection. Interesting details of resistance- and control-gear construction were given, with diagrams of control connection. Multiple unit control was rarely necessary on locomotives, so that the reversers, main circuit breakers, &c., need not be actuated by remote control. In the United States, however, the reverser was sometimes replaced by a series of contactors. On A.C. locomotives, oil circuit breakers similar to those employed in central stations could be used. Automatic acceleration control was of considerable advantage, especially in goods locomotives. Induction regulators had to be of very strong construction, as the mechanical forces were very heavy at starting, and on short-circuit. In some cases motor-driven drum-type controllers were used instead of a contactor system; but they had the disadvantage of being slow in action. In general auxiliary motors on locomotives should be as few as possible.

Two Papers dealing with electric railway rails were read at the Institution of Civil Engineers last Tuesday. In the first Paper Mr. W. Willox explained that the reduction of the life of rails in tunnels from an average of five to an average of less than three years, and in certain places to less than one year, on the electrified portion of the Metropolitan Railway, had induced him to make tests of the various kinds of steel rails in the curve between Farringdon Street and Aldersgate. Here there were forty-two booked trains on each line per hour in the morning and evening. The conclusion he came to was that open-hearth basic Bessemer rails, manufactured by the late Mr. C. P. Sandberg's process, and under careful supervision, were the most economical. The number of broken rails for the last six years had been very small. The wear after five years was about  $\frac{1}{8}$  lb. per yd. The second Paper, which was by Mr. Stephen Sellon, was entitled "Rail-Corrugation and its Causes." The author said that corrugation was due to the failure of the rail-table under the stresses imposed upon it. In the corrugations the "crests" had the appearance of cold rolled steel, and were relatively hard and refractory to acid; and that the "hollows" were dull, showed some lateral detrusion and pitting, and were only slightly harder than the body of the steel. He believed that the use of hard rails, i.e., those with a high proportion of carbon, was necessary to resist the corrugating action of the wheels, as well as ordinary wear. A comparatively small increase in the compressive strength of the steel would prevent corrugation. The compressive strength was probably about the same as the tensile strength, as the British standard specification prescribed an ultimate tensile strength of 40 tons per sq. in. If this were increased to between 50 and 60 tons per sq. in., provided that a high

ductility were retained, the destructive stresses would probably be resisted.

At the ordinary meeting of the North Staffordshire Railway Co. last week it was stated that not only is the Company installing track circuit signalling throughout the whole of its system, but that every coach on its lines is now electrically lighted.

It is stated that the Hove Corporation has sanctioned the commercial running of trolley-omnibuses on one route as an experiment.

During the week meetings have been held of the Metropolitan District, the Central London, and the London Electric Railway Companies. As far as the two last-named are concerned, the profits available are less than in the preceding twelve months, mainly due to increased coal costs and improved conditions of the staff. On the other hand, there is a large amount of capital expenditure upon linking up works, which must undoubtedly have a very beneficial effect upon the receipts of the Companies in the future. Very much the same condition of affairs was reported at the annual meeting of the City & South London Railway Co., where there has been a heavy drop in receipts due to surface competition, but the intercommunication scheme between this and the other underground railway companies of London is looked to to bring about an important improvement.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A new development took place on Monday in the action which Marconi's Wireless Telegraph Co. is bringing against the Helsby Wireless Telegraph Co. for infringement of the famous Marconi Patent No. 7,777, of 1900. (This patent expires on April 26th.) Mr. Courtney Terrell, on behalf of the Helsby Co., applied in Court to Mr. Justice Joyce, under Section 31 of the Patents Act, 1907, for the appointment of an "assessor" to assist the Judge in trying the case. The application was granted. Section 31 of the Act referred to reads: "In an action or proceedings for infringement or revocation of a patent, the court may, if it think fit, and shall on the request of either of the parties to the proceedings call in the aid of an assessor specially qualified, and try the case wholly or partially with his assistance; the action shall be tried without a jury unless the court otherwise directs. . . . The remuneration, if any, to be paid to an assessor under this section shall be determined by the court or the Court of Appeal, as the case may be, and be paid as part of the expenses of the execution of the Act." Mr. J. Hunter Gray, on behalf of the Marconi Co., opposed the application on the grounds that no "specially qualified" assessor could be found. Mr. Justice Joyce, however, decided that an assessor should be appointed, and directed the parties to the action to agree on someone, or failing that to apply to him in Chambers. Mr. Terrell suggested that Lord Parker (Chairman of the P.O. Wireless Advisory Committee) might be asked to suggest someone who was qualified. It appears that some considerable time must yet elapse before the case comes on for hearing.

A Local Government Board inquiry will shortly be held with regard to the borrowing by the Hull Corporation of £192,423 for the purchase of the Post Office telephone system in Hull.

The last number of the *Telefunken Zeitung*, a copy of which has been sent us by Siemens Bros. & Co., Ltd., contains, in addition to many items of news, an interesting account of the saving of the *Volturno* by wireless telegraphy, a note on the wireless equipment for the forthcoming Amundsen North Pole expedition, and an article describing the erection of a wireless station in Siam.

A description of the Siemens automatic telephone exchange system appears as a separate article on page 113.

The proposed issue of new stock by the Constantinople Telephone Co., referred to last week, has duly been made. The amount is 200,000 six per cent. obligation bonds at 97.

A Wireless Telegraph Society was formed in Nottingham on Monday evening, when about thirty-five persons were present. Like those in other large towns, this is a society of amateurs. The Secretary is Mr. H. Gill (Premier Road, Nottingham).

The viâ Hanekin route was restored on the 17th inst., and the S. Miguel-Fayal cable on the 18th inst.—The Bagdad-Bassorah line was down on the 19th February, and on the following day the Oran-Tangier cable was repaired.—The Bagdad-Bassorah line was working again on the 20th inst.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published Feb. 19th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

1,915/13. **Manufacture of Tungsten for Drawing into Filaments.** B.T.-H. Co. (*G.E. Co., U.S.A.*). This is an improvement on the method of preventing "offsetting" when the filaments are used on A.C., described in Patent No. 18,467/11. A solution of a rare earth compound is incorporated with the tungstic oxide or compound from which the powder for use in the production of the drawn filaments is to be produced. The mixture is heated in an oxidising atmosphere and then reduced. A particular method consists in the use of a solution of thorium nitrate. The patentees state that they do not claim anything described in Patent No. 15,915/06 by Deutsche Gasglühlicht A.-G.

2,918/13 and 2,919/13. **Wireless Transmitters.** G. MARCONI. The first specification, which has two diagrams of connections, relates to an improvement on the transmitter described in specification No. 4,593/07. According to this specification a working condenser was connected to the middle of a split condenser, and charged alternately in opposite directions by means of a rapidly rotating toothed disc. Now a series of working condensers is used. One plate of each is connected to the middle of a split condenser which is in series with a source of direct current, a key, and an inductive resistance, while its two outer plates are connected to two toothed discs, preferably mounted on the same shaft. One half of the split condenser may be short-circuited, and if the inductance of the generator is sufficiently low the other may be omitted. The inductive resistances of the working condensers all act as primaries to the secondary in the aerial. The second patent claims the arrangement of the apparatus, so that each condenser except the last discharges into the next, while the dischargers discharge the condensers in synchronism with the period of the aerial. One figure.

3,445/13. **Dynamo Iron.** W. RÜBEL. A dynamo iron in which the eddy current and hysteresis losses are small, and which is soft and can be rolled without breaking, as well as being, it is said, cheap to manufacture, is obtained by the addition to iron, which does not contain more than 0.5 per cent. of impurities, of an amount of aluminium and silicon not exceeding 3 per cent. of the alloy, and of which the aluminium is between 1.3 and 2 per cent. and the silicon between 0.8 and 2.0 per cent. Boron may be substituted for the silicon and beryllium or calcium for the aluminium.

4,425/13. **Signalling on Tramcars.** R. HEATON. Two differently toned bells are used in independent circuits. There is a push in each circuit, and in one case also a switch which is opened when anyone is standing on the step of the car. This circuit is used to give the starting signal only. Six figures.

7,722/13. **Incandescent Lamps.** T. W. LOWDEN. A good distribution of light in the downward direction is obtained by the use, in combination with an insulating support, of a filament helically encircling it. It is connected to the support by means of looped or twisted branches integral with the lighting portions of the filament. The support may consist of a number of legs. The diameters of the convolutions of the filament may decrease towards the pip. The arrangement is an improvement on that given in Patent No. 1,180/12. Five figures.

8,267/13. **Supplying Power to Tramway and Railway Vehicles.** A. HELFENSTEIN. Contact strips or rails are arranged on the vehicles and power is supplied from a number of fixed points along the track. These are formed by a group of freely hanging contact elements, e.g., chains or metal strips, which come into close contact with the contact rails on the vehicles, without pressure on the contacting members and without any considerable stress on the masts, contact pieces, or vehicle. The vehicle contact rails are grooved or ribbed. Part of the hanging contact element is of iron. Five figures.

8,962/13. **Ovens.** R. WEAVING and the FERRANTI Co. To reduce the thermal capacity of the material forming ovens, they are made of or lined with pure rolled aluminium.

## Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** BROCKIE and JOHNSON & PHILLIPS [*Magazine lamp*] 4,926/13; ENGINEERING & ARC LAMPS and DOWDELL, 8,301/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** HEANY [*Insulating conductors*] 18,517/13.

**Dynamos, Motors, and Transformers:** OTIS ELEVATOR CO. (*Otis Elevator Co.*) [*Hoisting motors*] 3,250/13.

**Electrometallurgy and Electrochemistry:** SOC. GÉNÉRALE DES NITRURES [*Aluminium nitrides*] 11,091/13. CLEMM [*Electrolysis of alkali chlorides*] 21,462/13.

**Heating and Cooking:** K.P.H. SYNDICATE and KRATT [*Liquid heating*] 3,370/13.

**Ignition:** HARDINGHAM (*Mafam Motor Apparate Ges.*) [*Magneto*] 16,566/13; ANSCHUTZ [*Magneto*] 22,527/13.

**Incandescent Lamps:** CANELLO [*Malleable tungsten*] 5,150/13.

**Instruments and Meters:** EVERETT, EDGUMBE [*Thermal*] 3,110/13; KORTING & MATHIESEN A.-G. [*Meters*] 27,877/13.

**Switchgear, Fuses and Fittings:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [*Controllers*] 2,418/13; WM. McGEORCH & Co. and McGEORCH [*Switches*] 2,758/13; MILHAM [*Combination adaptor for fittings*] 5,063/13; QUILLIAM [*Sealing boxes containing electrically-worked railway and tramway point mechanism*] 6,982/13; PAISTE [*Plug type fuses*] 15,760/13.

**Telephony and Telegraphy:** KAEHLER [*Telegraphy*] 8,173/13.

**Traction:** JULIUS PINTSCH [*Signalling*] 3,561/13; IRVING and BRITISH PNEUMATIC RAILWAY SIGNAL CO. [*Electro-pneumatic signalling and point working*] 8,746/13.

**Miscellaneous:** BOWES, SCOTT, & WESTERN and DALGLEISH [*Magnetic separators*] 3,046/13; HARRINGTON [*Illuminated signs*] 5,010/13; OBERLANDER, KAZVINCZY, and GROSS [*Moving advertisements*] 8,711/13; RUSHTON [*Clocks*] 10,100/13; SIEMENS BROS. (*Siemens & Halske A.G.*) [*Setting apparatus from a distance*] 18,751/13; BICKFORD, SMITH & Co. and SMITH [*Blasting fuses*] 28,634/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos, Motors, and Transformers:** A.E.G. [*Automatic protection against damage due to ignition of air-filters*] 24,450/13; FRIEDR. KRUPP A.-G. [*D.C. dynamo*] 1,405/14; SIEMENS SCHUCKERTWERKE GES. [*A.C. commutator machines*] 2,409/14.

**Switchgear, Fuses and Fittings:** OLAZABAL ENLATE [*Pneumatic current limiter*] 25,236/13; RADLEY [*Motor controllers*] 1,975/14; McKINNIE [*Illuminating or reflecting*] 2,529/14.

**Telegraphy and Telephony:** FESSENDEN [*Oscillatory electro-dynamic apparatus for submarine signalling*] 18,765/13; SIEMENS & HALSKE A.-G. [*Telephone systems*] 1,792/14, 1,871/14, and 2,211/14; GOLDSCHMIDT [*Spark-gap for wireless*] 2,214/14; LYNG [*Signalling systems*] 2,595/14.

**Miscellaneous:** HILLESHEIMER [*Air washers*] 2,143/14.

## Amendments to Specifications

20,277/04. **Manufacture of Drawn Tungsten Filaments.** C. D. ABEL (*Siemens & Halske, A.-G.*). This specification has now been amended on the application of Siemens Bros. & Co. practically as asked. (*ELECTRICAL ENGINEERING*, May 8th, 1913, p. 264; Vol. VIII.)

21,462/11. **Absorption of Radio-Active Emanations.** C. ABEL-MUSGRAVE. This specification has been amended by way of disclaimer under section 8 of the Act. The subject-matter relates to increasing the collecting powers for radio-active emanations of carbon, &c., by applying a negative potential.

## Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

3,968 of March 1st, 1900. **Siphon Recorders.** A. MUIRHEAD and R. H. EDGAR. A protection for the signal coil is provided by placing it in a secure part of the instrument where it can be kept covered. It is suspended by single fibres top and bottom, and connected by double fibres to the siphon suspension, which is placed in the front part of the instrument. This suspension is adjusted by a guide bearing against the directive strips and travelling up and down between two vertical rods. By means of a separate circuit wound on the signal coil the damping can be adjusted. Other features of the invention relate to a stiffening construction for the siphon, and to the governing of the driving motor.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** E. GIRAUD [*Overhead lines: protection of system against breakage of line*] 23,978/03; W. H. K. BOWLEY [*Flexible cable armouring*] 24,125/03; VICKERS, SONS, & MAXIM and A. D. WILLIAMSON [*Control for planing machines, &c.*] 23,908/08.

**Switches, Fuses and Fittings:** M. KALLMANN [*Automatic motor starters using a series resistance of iron*] 24,995/06.

**Telephony and Telegraphy:** G. L. ANDERS and M. BYNG [*Selective switch, relay or indicator*] 23,971/04.

**Traction:** J. P. TIERNEY and J. MALONE [*Working rail and tramway points from the vehicles*] 22,763/05.

**Miscellaneous:** J. STONE & Co. and A. H. DARKER [*Ventilating railway vans, ships, &c.*] 22,452/05.

## ELECTRIC LIGHTING OF MOTOR CARS

IN a Paper on Electric Lighting for Motor-cars, by Mr. J. C. Hutton, recently read at a meeting of the Wolverhampton and District Engineering Society, the author remarked that electric lighting had practically superseded all other methods for motor-car lamps, and proceeded to outline the various dynamo systems which have been developed to keep the battery charged. The problem was to provide a dynamo which would give a practically constant voltage at all engine speeds above a certain value, in conjunction with automatic features, to connect and disconnect the battery at the proper times. In the permanent magnet type, such as the "Magnetolite" and "Lodge" machines, the constancy of voltage was obtained by the exaggeration of armature reaction and resistance drop. He next described at some length the Brolt, Rotax Leitner, and C.A.V. systems, all of which have been referred to in our columns from time to time, and also depend largely on armature reaction for the voltage regulation. Another method of regulation was by iron wire ballast resistances either in the field circuit, as

in the Rushmore system, or in the main circuit, as in the Lathanode system. A curious electrically regulated machine was the "Magician," in which the brushes were rocked by the movement of the body of the machine on ball bearings. On the whole, however, the author preferred mechanical to electrical regulation, on the ground that if the dynamo is not to be subjected to too large a speed variation, it could be smaller and better designed as regards heating and commutation. He described a centrifugal slipping clutch used in the T.E.C. system of the Efandem Co. (Wolverhampton) for preventing the dynamo speed rising above a certain value, and then proceeded to give details of the solenoid cut-out switches usually employed to disconnect the dynamo when the speed falls below the lower limit of its constant voltage range. He did not favour the system in which the dynamo is allowed to free-wheel as a motor in these circumstances. A useful detail in switchgear was to interlock the headlamp and dynamo switches, so that the former could only be used when the dynamo was charging the battery. Particulars were also given of a tail-lamp indicator.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 123. —

## CATALOGUES, PAMPHLETS, &amp;c., RECEIVED

**LIGHTING FITTINGS.**—A supplementary list has just been issued by The Benjamin Electric, Ltd. (1A Rosebery Avenue, E.C.). Besides full particulars and prices of the well-known Benjamin lighting specialities, there is information on industrial and other lighting problems, together with illustrated examples of good illumination for various classes of work obtained by the use of "Benjamin" equipment. All the fittings have been scientifically designed and mechanically constructed, and when correctly installed excellent results are obtained. We note that the list embraces weatherproof reflector fittings, steel reflectors, with the "Ezekleen" reflecting surface, for mills, factories, workshops, &c., "Marbella" opal reflectors, semi-indirect fittings with wireless cluster body, and a variety of fittings for shop-window and show-case lighting. In addition may be mentioned the new Benjamin-Wirt "Dim-a-Lite" turn-down attachment for lamp-holders, hand-lamps, and a number of useful accessories, including a friction-drive screwdriver set, with provision for using a number of different sized blades.

**INSULATING MATERIAL AND WIRE-DRAWING LUBRICANTS.**—A leaflet received from Werths & Co. (41 Aldersgate Street, E.C.) describes a new vulcanised insulating compound for cables and wires, known as Vulcanwax, which we understand has already been adopted by well-known cable makers in this country. Another leaflet from the same firm deals with "Hydrofat" lubricants for wire drawing. These are fats which readily emulsify in water, but have undergone no process of saponification and are quite neutral in their chemical reaction.

**CONDENSERS.**—The "Hydra" condenser for telephone, telegraph, and other purposes is listed in a leaflet from James McMillan & Co. (Clun House, Surrey Street, Strand, W.C.), in capacities from 0.06 to 10 mfd. These are very compact, and great constancy is claimed for their capacity.

**HEATING AND COOKING.**—We have received from Simplex Conduits, Ltd. (Garrison Lane, Birmingham), copies of supplementary catalogues dealing with Plexsim cooking and Plexsim heating apparatus. Both of these lists are arranged for overprinting with customers' names and addresses. Requests for supplies should be addressed to the Birmingham office of the company. Among the articles listed in the cooking catalogue is a rapid boiling plate in 6-in. and 7-in. sizes, loaded to 800 and 1,200 watts respectively. By the addition of an extension piece, an increased heating surface may be obtained. Other items include a new type of coffee pot, curling tongs heaters, bed-warmers, and electric irons. The heating catalogue covers a wide range in lamp radiators, including a series in period styles, convectors, and the adjustable Plexsim glowing fire, which is loaded to 600 watts only.

The Editor has received from the Union Cable Co., Ltd. (Dagenham Dock, Essex) a compact and useful form of cigar-lighter of simple and robust construction, such as the company are distributing to their friends.

We are in receipt of an artistic wall calendar from Kelvin, Bottomley & Baird, Ltd. (16 Cambridge Street, Glasgow).

## HALF-WATT LAMPS FOR SHOP LIGHTING

THERE is undoubtedly a large field in the application of half-watt lamps for shop lighting, both interior and exterior. Messrs. Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston), send us particulars of some new lanterns which are specially adaptable to this purpose. In designing these lanterns for their Wotan half-watt lamps special care has been taken to ensure efficient ventilation, and an adjustable carrier is provided to regulate the position of the lamp in the lantern. They are made of black, vitreous enamelled iron, and provided with an insulated shackle suspension. One of these patterns has a metal parabolic reflector, and is intended for the exterior illumination of

With opal globe open at the bottom.

With parabolic reflector.

HALF-WATT FITTINGS FOR SHOP LIGHTING.

shop windows. In this case a maximum illumination is focussed in one direction, whilst the source of light is well screened from the eye on the opposite side. These lanterns should become very popular for the window lighting of large stores and business establishments. The other lantern, which is illustrated here, is fitted with a distributive type of metal reflector and an opalescent globe open at the bottom. The effect of this globe is to give a soft diffusion of light without diminishing the floor illumination—at the same time being open at the bottom, it aids the effective ventilation of the lantern. The size of lantern for use with a 1,000-c.p. half-watt lamp is 19 in. by 14 in., and the list price is as low as 27s. A price list embodying these designs will shortly be issued.

### "HALF-WATT" LIGHTING

ACCOUNTS of two interesting installations of Mazda half-watt lamps have been sent us by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.). One of these is in the Bargain Basement at Messrs. Selfridge's, Oxford Street, where a number of Mazda half-watt lamps equipped with Alba glass spheres have recently been installed in place of enclosed arc lamps. Some tests made in this department gave the following results: The enclosed arc lamps, fitted with opal reflectors, and consuming

FIG. 1.—HALF-WATT LAMPS AT SELFTRIDGE'S.

780 watts each, gave an average intensity of 2.5 foot-candles on a plane 3 ft. from the floor. The same number of 500-watt Mazda half-watt lamps, equipped with Alba spheres, gave an average of 7.5 foot-candles in precisely similar conditions. If the half-watt lamps had been fitted with reflectors instead of globes, their comparative efficiency would have been even higher. As it is, the substitution of Mazda half-watt lamps has effected a saving of 36 per cent. in current, and an increase in illumination of 200 per cent. So far as colour matching is concerned—and this is a very important con-

FIG. 2.—HALF-WATT INDIRECT LIGHTING AT THE VAUXHALL SHOWROOMS.

sideration in such installations—the illumination given by the half-watt lamps is equally as good as the original arc light—that is to say, about the same number of colours can be matched under both. For example, although blues, greens, greys, &c., are better matched by arc lamps, reds, browns, yellows, &c., can be judged more accurately under the light of the half-watt lamps.

The other installation referred to is at the Vauxhall Motor Co.'s showroom in Great Portland Street, and consists of Mazda half-watt lamps in composition bowl "Eye-Rest" fittings. Indirect lighting has special advantages in a motor

showroom in the absence of shadows, which even renders it possible to examine the under part of a chassis without using a hand-lamp, and in this case these advantages are combined with the improved efficiency of the half-watt lamps, so that economy as well as excellent illumination is obtained.

FIG. 3.—SEMI-INDIRECT LIGHTING FITTINGS FOR HALF-WATT LAMPS.

The B.T.-H. Co. have just put on the market two more half-watt fittings, which we illustrate in Fig. 8. Both are for semi-indirect lighting, one having a beautifully etched Calla glass bowl, and the other being a short suspension fitting with an opalescent bowl and a white top reflector.

### A WELL-LIGHTED DRAWING OFFICE

THE lighting of a drawing office is not an easy problem, and some interest attaches to the way in which the British Thomson-Houston Co.'s Illuminating Engineers tackled the question in the Company's own drawing office at Rugby. Semi-indirect fittings equipped with clusters of Mazda lamps are used. The fittings are of the "Lumino"

B.T.-H. DRAWING OFFICE AT RUGBY.

type described in ELECTRICAL ENGINEERING a few weeks ago, and have opalescent globes and white enamelled metal-top reflectors. There is a double row of these fittings down the whole length of the drawing office, which means roughly one fitting to each two drawing boards. The fittings are suspended from the girders, about 12 ft. above the drawing boards, and the illumination is such that it is impossible for a draughtsman to cast a shadow on his board from any direction.

## RECORD CIRCUIT BREAKERS

VARIOUS TYPES & SIZES  
5 AMPS. UPWARDS.

THESE circuit breakers have been designed for durability and will withstand the roughest use. All contacts and other live parts are easily accessible and well insulated. Owing to the peculiar construction they close remarkably easily, but cannot be closed on an overload. They can be fitted with no volt or time limit attachments if required. Arcing and burning of contacts is reduced to a minimum by means of an efficient magnetic blow out. We shall be pleased to send — you our list C 2 on application. —

## ALL OTHERS BOW BEFORE *The* **CRYSELCO** METAL FILAMENT LAMP.

*Because?*  
IT NOT ONLY SAVES  $\frac{3}{4}$  OF YOUR CURRENT BILL  
BUT IS STRONGER, BRIGHTER, &  
MORE DURABLE THAN ANY OTHER.

## FACTORY FITTINGS

We stock an extensive range of ironclad and watertight fittings for factories, mines, ships, &c.

Any type can be supplied, ordinary Enamel, Real Vitreous Enamel or Galvanized: also in brass for ship installations.

Let us quote you prices,  
you will find them right.

The **Sun** ELECTRICAL COMPANY LTD.  
118-120 Charing Cross Road, London, W.C.

When corresponding with Advertisers, please mention "Electrical Engineering."

## Time Costs Money

and Machining takes time and moreover does not always give perfect interchangeability—an essential requisite of such pieces as that here shown.

## "PRANA" DIE-CASTINGS

save machining—ergo, time and money, and are accurate, reliable and interchangeable.

**BUT THEY MUST BE "PRANA"**  
—British made; "tough and true."

Write for Leaflet E.E. 6 to  
**AERATORS Ltd.** UPPER EDMONTON, LONDON, N.

## AN ELECTRIC PUMP

A VERY serviceable little pump, known as the "Ravensbourne," has recently been introduced by Messrs. Merryweather & Sons (Greenwich Road, S.E.). It is made in sizes ranging from 500 to 4,000 gallons capacity per hour, and is well adapted for driving electrically. It is specially suited to small horse-powers, and is being extensively adopted in cases where light pumping machinery is in demand. The illustration shows a compact set of this design, which has recently been fitted up at Pyrford Court, Woking (the seat of the Hon. Rupert Guinness), for garage water-supply. The pump is of the double-barrel reciprocating type, constructed of gun-metal, with copper air vessels, and is capable of delivering

"RAVENSBOURNE" ELECTRICALLY-DRIVEN PUMP.

500 gallons per hour against a head of 100 ft. It is driven by an electric motor running at a speed of 960 r.p.m., and developing 1 h.p., the current being taken from the existing electric light installation. The pump draws its supply from a rain-water tank, and delivers through a wrought-iron pipe into a tank placed on the roof of the garage. The roof tank is fitted with an outlet pipe to a tap close to the yard-level, to supply water for cleaning operations—such as the washing-down of cars. A branch is also taken from the delivery pipe at a point between the pump and the roof tank. The branch serves a small hydrant in the yard, from which the full pressure from the pump can be obtained for fire-extinguishing purposes. The roof tank is fitted with an alarm indicator, with float and electric bell, which rings automatically when the tank is full.

## ACCESSORIES FOR CONDUIT WIRING

WE have received from Simplex Conduits, Ltd. (116 Charing Cross Rd., W.C.), particulars of several new items which have recently been added to the well-known conduit system of electric wiring which bears their name. These include interlocking switches and plugs, watertight switches, various types of conduit holdfasts, and porcelain interiors. The conduit holdfasts are designed for conduit runs which require to be attached to girders, and patterns are shown which are suitable for attaching the tube both when the run is parallel to the girder and when at right-angles. Other forms of these are intended for surface installations in factories and situations where moisture is present. They are so designed as to space the conduit some distance away from the surface of the wall, and are specially recommended

NEW DESIGN OF PORCELAIN INTERIOR FOR RECTANGULAR JUNCTION BOXES.

where it is desired to paint the conduit subsequent to erection. Another item of interest is a new design of porcelain interior, which we illustrate herewith, intended for use with standard types of rectangular junction boxes as a means of tapping off the main circuit wires or for connecting a flexible wire to a light point. The interior is double pole, and has two main terminals of special design, hexagonal in shape, and with a central slot threaded internally to take a grub screw. The particular advantage of this type is that it is not necessary actually to sever the conductor to make connection. The insulation is bared back about half an inch, and the exposed conductor dropped into the slot and secured by the grub screw. The terminals are of sufficient size to allow of a small cheese-head screw being tapped into the side for connecting the branch wires.

**Deported Tantalum Lamps.**—With their characteristic smartness, Siemens Brothers' Dynamo Works, Ltd. (Incandescent Lamp and Fittings Department, Tyssen Street, Dalston), have seized the opportunity of the arrival of the deported South African Labour leaders to inform us that the *Umgeni* is one of the many boats fitted with marine type "Tantalum" Traction Lamps. Messrs. Bullard, King & Co., who control the Natal line of steamships (to which the *Umgeni* belongs), have been using "Tantalum" lamps for lighting their fleet of steamers during the past three years with complete satisfaction.

**Metal Filament Lamp Patents.**—Osram Lamp Works, Ltd., has now issued a writ against Dick, Kerr & Co., Ltd. (Abchurch Yard, Cannon Street, E.C.), and Watlington & Co., Ltd. (48 Milton Street, E.C.), in connection with the sale of "Britannia" lamps, for alleged infringement of the Osram Patents Nos. 23,899/04 and 18,622/06. These are the patents relating to the production of pressed filaments which Mr. Justice Warrington decided were infringed by the "Z" Electric Lamp Manufacturing Co., Ltd., in the action brought against them by Osram Lamp Works, Ltd., in April, 1912. Since then several lamp companies have taken out licences to manufacture under these patents, and many dealers in lamps not made under licence, as well as lamp manufacturing companies, have been proceeded against.

**Half-Watt Lamps.**—The list of half-watt lamps referred to in our last issue was sent us in error. No new sizes are on the market in this country since those announced in our issue of January 15th.

FOR  
**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Basingstoke.**—Tenders will shortly be invited for plant for the Council's new power station.

**Bexhill.**—Cable extensions.

**Burton-on-Trent.**—An expenditure of £6,000 is to be incurred upon new plant at the power station.

**Dorchester.**—Tenders are invited for the electric lighting of the Town Hall and Corn Exchange. Borough Engineer. March 2nd.

**Dublin.**—Twelve months' supply of arc-lamp carbons. City Electrical Engineer. March 8rd.

**Knaresborough.**—Mr. George Wilkinson, Borough Electrical Engineer at Harrogate, has presented an electric supply scheme to the Council. The capital cost is put at £3,180, and a profit of £812 is estimated upon the sale of 40,000 units at 5d. per unit.

**Lancashire & Yorkshire Railway.**—At the annual meeting last week it was stated that a new power station is to be erected at Clifton Junction.

**London: St. Pancras.**—In order to comply with the Home Office Regulations, alterations are to be made at the Tavistock Place substation, involving an expenditure of £437. These include additional sections to the high-tension board of fool-proof design.

The Finance Committee of the L.C.C. recommend sanction to a loan of £9,248 for electrical extensions.

**Pembroke.**—Twelve months' supply of electrical stores. March 2nd. Borough Electrical Engineer.

**Rawtenstall.**—Street electric lighting at an estimated cost of £1,000 is to be carried out.

**Rotherham.**—One 2,000-kw. turbo-alternator, condensing plant, switchgear, &c.; one 1,000-kw. rotary-converter, transformer and switchgear; one 20-ton overhead crane. Borough Electrical Engineer. March 12th.

**Salford.**—One 40-h.p. electric motor. Borough Electrical Engineer.

**Stafford.**—The Corporation electricity department requires 5,600 yds. of new cable at an estimated cost of £6,300.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Barrow-in-Furness.**—Electric lighting at Blake Street school. Borough Electrical Engineer. March 3rd.

**Birkenhead.**—New school (£11,000).

**Blackpool.**—Hydro. (£100,000). Architects, Clegg & Sons, Manchester.

**Bradford.**—Two-storey warehouse at Greengates. Architects, Moore & Crabtree, 3 and 4 Exchange Buildings.

**Coventry.**—Extension of lighting system at workhouse. Architect, T. F. Tickner, High Street Chambers.

**Glasgow.**—Extensions to municipal buildings. Town Clerk, March 2nd.

**Halifax.**—Theatre. Associated Provincial Theatres, London.

**Holywell.**—Electric lighting is to be installed at the workhouse.

**Penistone (Sheffield).**—The Guardians are considering the installation of electric lighting.

**Salford.**—Additions to Nurses Home, Stepping Hill Hospital. Architects, Peirce & Son.

**Swansea.**—Additions to sanatoria (£12,000).

**Watford.**—New infirmary. Clerk to Guardians, Watford Place.

### Miscellaneous

**Australia.**—As from time to time tenders are called for by the Australian Commonwealth Postmaster-General for electrical supplies to standard specifications, it may interest British firms to know that a number of these specifications can be seen on file at the Commercial Intelligence Branch of the Board of Trade.

The Deputy Postmaster-General, Adelaide, requires a supply of thirty-five magneto and twenty common battery switch-

boards. April 8th. Copies of specification, &c., at 72 Victoria Street, S.W.

**Belfast.**—Twelve months' supply of electrical accessories for the Tramways Department. Chief Engineer. March 9th.

**Edinburgh.**—Twelve months' supply of electrical materials for interior wiring. City Electrical Engineer.

**Leeds.**—Reconstruction of tramway track. General Manager. March 8rd.

**Liverpool.**—Twelve months' supply of electrical stores for the Vestry of the Parish of Liverpool. Clerk, Parish Offices.

**Manchester.**—Further electrification of the works at the collieries of Andrew Knowles & Sons, Pendlebury.

**Merthyr Tydfil.**—Twelve months' supply of electrical stores for Guardians. Clerk, 134 High Street.

**Oban.**—A scheme for substituting electricity for gas in the street lamps at an estimated cost of £1,178 has been approved by the Council.

## TENDERS RECEIVED AND ACCEPTED

**London: India Office.**—The tender of the Edison & Swan United Electric Light Co., Ltd., has been accepted for Royal Ediswan lamps.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £67 to £67 10s. (Last week, £67 5s. to £67 15s.)

**Bankruptcy.**—A first dividend of 3s. in the £ has been paid in the bankruptcy of J. G. Hilton, Electrical Engineer, 235 Hagley Road, Birmingham.

**Companies Struck Off Register.**—The following have been struck off the register of joint stock companies: Auto-Controllers, Ltd.; Electrical Instrument Manufacturers, Ltd.; Improved Electric Traction, Ltd.

The following will be struck off the register at the end of three months, unless cause is shown to the contrary: Bombay Hydro-Electric Syndicate; Pearson Fire Alarm, Ltd.

## APPOINTMENTS AND PERSONAL NOTES

Mr. J. A. Bell, City Electrical Engineer at Aberdeen, has applied for an increase in salary. It is ten years since this matter was last considered by the Council, and during that time the output of the electricity undertaking has doubled.

The following increases of salary are recommended by the Highways Committee of the L.C.C.:—Mr. J. Welling, Permanent Way Engineer, from £575 to £600 per annum; Mr. A. R. Owen, Claims Superintendent, from £500 to £550 per annum; Mr. W. E. Ireland, Rolling Stock Superintendent, from £500 to £525 per annum; Mr. H. S. May, Assistant Rolling Stock Superintendent, from £300 to £325 per annum.

Mr. R. F. Dixon, Chief Electrical Engineer at the Hull Corporation tramways power station, has been appointed Works Superintendent in the Southampton Tramway Department, at a salary of £150, rising to £200. There were ninety-one applications.

A chief assistant is required in the Physics and Electro-technics Department of the Borough Polytechnic. (See advertisement on another page.)

An assistant engineer and superintendent is required by a firm of electric lighting contractors. (See advertisement on another page.)

## LOCAL NOTES

**Brighton: Electricity Profits.**—The amount to be taken from the electricity undertaking to relief of rates for the current year has been discussed. The Finance Committee's estimates included a sum of £5,000, but an amendment was moved reducing this to £3,000. After considerable discussion in the Town Council, however, the amendment was defeated by twenty-nine votes to fifteen.

**Crook: Public Lighting.**—An offer by the Newcastle Electric Supply Co. to supply current for 220 lamps at 27s. per lamp until midnight, or 30s. per lamp from dusk to dawn, has been referred to the Committee for further consideration.

**Grimsby: Supply Tariffs.**—The Engineer has been instructed to inquire into the rateable value and other systems of charging in order to ascertain to what extent the charges to consumers can be modified.

**Hornsey: I.M.E.A. Bill.**—The Council has refused to pass a recommendation asking Lord Ronaldshay, Member of Parliament for the district, to support the I.M.E.A. Bill in its present form. The Electricity Committee has taken the matter back in order to redraft the recommendation so that the Bill shall be supported if all wiring work is done through contractors.

**Huddersfield: Extensions of Electricity System.**—The Newmill Urban District Council has asked the Corporation to go into the question of extending the electric supply undertaking to that district, which is some two miles away from the present terminus of the Huddersfield tramways.

**India: Tata Electric Power Scheme.**—It is anticipated that the first supply of power from the Tata electric power scheme will be given in March.

**Liverpool: Electricity Accounts.**—The electricity accounts for the year ended December 31st show that after meeting capital charges and transferring £26,928 to renewal fund, a contribution of £25,000 is made to the relief of rates. The reserve fund now stands at £184,472, and the renewal fund at £115,152.

**London: Marylebone: Electric Lighting Loan.**—The Council is to take up a loan of £225,000 from the Liverpool Corporation in connection with the extension of their electricity undertaking.

**St. Pancras: Electricity Income Tax Assessment.**—The Surveyor of Taxes has agreed to a new basis of assessing the profits of the electricity undertaking, which has resulted in reducing the amount payable by £248. The new basis was evolved by Mr. Sydney Baynes, the Borough Electrical Engineer, and in deducting the profit derived from the supply of current for street lighting, as is the practice, consideration has been given to the actual cost of generation instead of taking the average cost, as was done in the past. The total units generated for both public and private lighting are now substituted for the total units sold, for the purpose of fixing the proportion of generating expenses incurred on public lighting.

**Lowestoft: Electrical Home Exhibition.**—An Electrical Home Exhibition will be held from April 22nd to May 2nd, under the auspices of the Electrical Department at the New Skating Rink, Freemantle Road. The address of the Organising Manager is 20 Pimlico Road, London, S.W.

**Macclesfield: Electricity Supply.**—The New Electricity Co. of Macclesfield anticipates being able to give a supply by Easter. It is now quite a number of years since electric supply schemes were first prepared for this district, and local manufacturers at one time almost despaired of ever obtaining a supply.

**Middlesbrough: Electric Supply.**—Last year the Corporation secured a transfer to the Middlesbrough area of the district of North Ormesby. An application for a supply of electrical energy from that district has caused consideration to be given to the position that the Cleveland & Durham Electric Power Co. is the electrical supply authority for North Ormesby. An attempt is to be made to arrange terms with the Company for the Corporation to supply in North Ormesby.

**Preston: Electric Supply.**—Notice has been given by a member of the Council of his intention to move a resolution recommending the appointment of a committee to consider the necessity for making additional provision for the supply of electricity in the borough, and, if thought desirable, to get into touch with the National Electric Supply Co. on the subject.

**Southampton: Position of Electricity Undertaking.**—The

difference of opinion between the Chairman of the Electricity Committee and the Borough Electrical Engineer, and a recent decision to slightly increase the hiring terms of electric radiators, seems to be having unfortunate results. Not unnaturally the Gas Company is taking full advantage of the present position, and the impression is growing among electricity consumers that prices will be increased all round by the Electricity Department. The result has been that since December 31st, when the higher rental came into force, 160 radiators have been returned. A few other consumers, apparently in a state of panic, have also returned other electrical apparatus on hire. The Borough Electrical Engineer has sent in a special report calling attention to the position.

**Southport: Electricity Tariff.**—The rateable value system of charging for electricity supply is under consideration by the Electricity Committee.

**Swansea: Electricity Profits and Rates.**—The Finance Committee, on its consideration of the possible amount which the Electricity Department should contribute to relief of rates for the current year, has been met with strong opposition from the Electricity Committee. It was pointed out that the reserve stands at £8,000, whereas it ought to be £20,000, but eventually the Finance Committee recommended the Council to allocate £700 from the electricity undertaking. During the past two years £2,200 have been taken from electricity profits for this purpose.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Dividends of London Supply Companies.**—The Westminster Electric Supply Corporation recommends a final 10 per cent. dividend, making 10 per cent. for the year, the same as in 1912.

A 5½ per cent. dividend is recommended on the ordinary shares of the South London Electric Supply Corporation for last year, the same as for the previous year.

A final dividend, making 9 per cent. for 1913, has been declared by the Kensington and Knightsbridge Electric Lighting Company. This is the same as for 1912.

**Waste Heat & Gas Electrical Generating Stations.**—The report for the year to January 31st shows a net profit of £28,745, after crediting reserve with £9,500, whilst the total balance available, adding the amount brought forward, is £37,710. A final dividend, making 8 per cent. for the year, is recommended, carrying forward £12,110. During the year two new generating stations have been put into operation, utilising exhaust steam from the Hordern Collieries.

**Newcastle-on-Tyne Electric Supply Co.**—A final dividend, making 5½ per cent. for the year, is recommended, an increase of ½ per cent.

**Bournemouth & Poole Electricity Supply Co.**—A final dividend, making 7 per cent. for the year, an increase of 1 per cent. over the previous twelve months, is recommended.

**Bruce Peebles & Co.**—The results of the trading for 1913 show a considerable advance on previous years. After meeting mortgage and debenture interest there is a net profit of £2,821.

**W. T. Glover & Co.**—A dividend of 5 per cent. is recommended on the ordinary shares, together with a bonus of 2½ per cent., both being the same as for the previous year. The sum of £6,500 is allocated to debenture redemption, £5,000 to reserve, and £5,000 is carried forward.

**British Electric Transformer Co.**—There was a net profit of £26,123 on last year's working, and a dividend of 10 per cent. is recommended on the ordinary shares, as in the previous year.

## NEW COMPANIES

**NORTH BRITISH ELECTRIC WELDING CO.**—Capital, £4,000. The subscribers include L. S. Taylor, Consulting Engineer, 610 Royal Liver Building, Liverpool.

**DORMAN & SMITH,** Ordsal Electrical Works, Salford. Capital, £50,000. To take over the existing business.

**WAYGOOD LIFTS (SOUTH AFRICA).**—Registered by Bristowe, Cooke & Carpmael, 1 Copthall Buildings, E.C. Capital £10,000. To take over the business now carried on by R. Waygood & Co. in South Africa.

**IRISH TELEPHONE (NEW SYSTEM) CO.,** 55 West Regent Street, Glasgow. Capital, £2,500.

**SCEANDO LAMP CO.,** 7 Blackfriars Street, Salford. Capital £100.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

A NEW I.M.E.A. Bill is being drafted to give local authorities power to sell and hire electric lighting and heating apparatus, but making it obligatory to sub-let the wiring to a contractor, without undue preference. Other interesting clauses are included, and the B.E.A.M.A. has promised its support to the Bill. (Page 127.)

We give some further information with regard to the opposition to the London Electric Supply Bill. (Page 127.)

THE design of choking coils and auto-transformers for obtaining a reduced voltage from an alternating voltage is dealt with in our Questions and Answers columns. (Page 128.)

THE Home Office inquiry into the Senghenydd disaster has been completed, and some of the most interesting evidence has been the account of special experiments to determine the degree of danger of ignition of gas by sparks from signalling circuits supplied at different voltages. (Page 129.)

In a Paper on the design and maintenance of miners' electric safety lamps, read by Mr. F. J. Turquand before the London Branch of the Association of Mining Electrical Engineers, the author emphasised the need for properly annealed glass domes. He estimated the life of a lead cell in a miner's lamp at about 500 charges and discharges, equivalent to about twelve

months' use. Mr. W. Maurice put the life of the whole lamp at about half this, but Mr. Haslam put the life even higher than the author did. Almost all lamps now made have rotating switches. (Page 130.)

A PAPER read recently before the Association of Mining Electrical Engineers by Mr. H. J. Wroe described a powerful electrical pumping installation used during sinking at the Tilmanstone Colliery, Kent. (Page 131.)

THE patent specifications published during February which are of special interest to mining electrical engineers and electrometallurgists embrace miners' safety lamps, blasting fuses, induction furnace design, the driving of non-reversing rolling mills and magnetic separators. (Page 131.)

AN attempt is being made to revive the agitation against electricity in mines. (Page 133.)

A SPECIAL design of gate-end box is illustrated. (Page 133.)

THE following specifications are among those published by the Patent Office last week:—One by J. Brookie and Johnson & Phillips for a magazine arc lamp, one by J. Canello for a process of manufacturing malleable tungsten from the pure powdery metal, and one by H. and P. Kaehler for a printing telegraph, in which some of the principles of the Hughes and Murray instruments are combined. (Page 134.)

AT the Institution of Electrical Engineers last Thursday, Mr. F. Lydall stated, in a Paper on electric locomotives, that there was at present a general tendency towards the use of gearing in place of side-connecting rods. For D.C. freight locomotives in this country the articulated bogie principle with four-g geared motors was the best. During the discussion, Mr. Roger T. Smith dealt with the advantages of electric traction for heavy freight trains in hilly districts. As every position of the controller in an A.C. locomotive was a running position, the difficulty of slipping of the wheels during acceleration was not so liable to be present as with D.C. locomotives.—A petition against the Bill now before Parliament for providing for a joint committee of the G.N. and Met. Railway Companies to work the G.N. & City Railway is to be deposited.—The section of the L.B. & S.C. Railway from Balham to Wallington will be converted to electric traction during the year. (Page 135.)

WORK on the English base station of the Imperial Wireless Chain has been started at Leafeld, Oxfordshire. India will be in direct communication with Egypt as a suitable site for the proposed three-way station in East Africa could not be found. A site has, however, been chosen for a smaller two-way station in East Africa, as this is necessary for communicating with South Africa. (Page 135.)

SOME new fittings for use with half-watt lamps, and new designs of electrically-driven tools, are described

## MUNICIPAL WIRING POWERS

THE Incorporated Municipal Electrical Association have interested the British Electrical and Allied Manufacturers' Association in a new Bill which they are drafting. The draft Bill has been submitted to the Electrical Contractors' Association for its approval, but if this is not obtained, we understand that the B.E.A.M.A. has decided to support the proposals. We have not been informed when the Bill will be introduced; presumably it would stand more chance of being passed into law after the next General Election than in the present session of Parliament.

The Bill differs in some important respects from the previous one. After giving Local Authorities power to sell and hire electric lighting and heating apparatus, clauses are added to protect the contractor from any under-selling, and it is specifically stated that the wiring is to be sub-let to a contractor without undue preference if there is more than one electrical contractor in the district. Municipal showrooms, exhibitions, and general advertising are to be authorised.

The stand-by supply clause is embodied in a new form, which entitles the supply authority to make a special charge for supply "taken on extraordinary occasions." This, of course, covers stand-by to an independent lighting or power plant, or to gas-lighting or gas, steam, or oil power, but would not entitle a special charge to be made for regular supply to part of a consumer's installation.

As in the last I.M.E.A. Bill, subscriptions to Associations and delegates' expenses are authorised, provisions are inserted with regard to the establishment of a fund for working capital, and the extension of the Conspiracy and Protection of Property Act of 1875 to electricity works is asked for to prevent the continuity of electrical supply being endangered by strikers.

A clause is embodied to exempt from distress, fittings, &c., let on hire by contractors, and a new clause is under consideration to permit mains to be laid in private roads not yet taken over by the Local Authority.

In spite of the great trouble which has evidently been taken to make the Bill acceptable to every section of the industry so as to avoid opposition, we fear that its fate will be indefinite postponement until the political atmosphere is clearer.

## THE LONDON ELECTRIC SUPPLY BILL

WE are enabled this week to give particulars of the terms of the petitions against the London Electric Supply Bill. The London County Council's petition is practically in the same terms as the report of the Parliamentary Committee, published in our last issue, and the Council—almost with sarcasm—objects to any further powers being granted to a number of companies who have apparently not agreed amongst themselves. We may add that it is expected that Mr. Merz's report to the L.C.C. will probably be available in about a month's time, and that, if this is adopted by the L.C.C., it is not unlikely that an entirely new complexion will be placed upon the present controversy.

The Corporation of the City of London has filed a petition against the Bill, pointing out that the proposals are in direct conflict with the powers under which the City Co. and the Charing Cross Co. are carrying on their undertakings in the City, as they are now expressly forbidden from associating except for the purpose of mutual assistance.

Practically all the petitions of the electric supply companies complain that the Bill does not contain definite details of the proposals, and insist that it would be inexpedient to confer powers by which the companies might be competing with one another for postponement of the date of purchase by the L.C.C., or alteration in the terms of purchase. The L.C.C., they say, must not be relieved of its obligation not to purchase one company's undertaking without giving notice to purchase all. The Acts of 1908 and 1909 left the companies in harmony, and they object to "any new factor of disagreement" being introduced. To give powers to the L.C.C. to purchase a new generating station some distance outside the County of London would totally alter the conditions under which the existing stations might be purchased. It is evident that they fear that the result of passing the Bill might be the erection of one or two brand-new stations outside London, and an entirely new system of supply for the metropolis, so that a large proportion of the existing stations and plant would be rendered redundant, and be reduced to "scrap" value so far as its utility for the new system was concerned. Power given to the proposed new

company to carry out this scheme would give it a lever to force the existing companies in, and to some extent to dictate terms to them, and the companies apparently regard their position as more secure under the definite terms of the 1908 Act, by which the L.C.C. is the purchaser of all the companies in 1931.

The petition of the Hammersmith Borough Council says that if the date of purchase of the companies is to be postponed, the right of the Borough Councils to purchase should be restored to them, in view also of the fact that under the Acts of 1908 and 1909 the Borough Councils may co-operate.

The Woolwich Borough Council view with alarm a competitor for supply which they themselves hope to give in contiguous areas. They also foresee that the acquisition of the companies in 1931, if the law remains unaltered, will make it necessary for the L.C.C. to acquire the Borough Council's undertakings at the same time to secure the unification of supply throughout the County of London, which they think should not be deferred longer. They object to the date and terms of purchase being left for determination by individual agreement, and maintain that they should only be dealt with by express enactment of Parliament.

The Marylebone Borough Council, in their petition, raise these two last points also, and in addition insist very much on the useful work they themselves have done to reduce the prices charged for electricity. Mr. Seabrook's personal point of view, we believe, is that the present opportunity might well be taken to perfect a new scheme for the supply of electricity in London, taking account of all the factors that now exist.

The attitude of the London electric supply companies towards the London Electric Supply Bill is also made evident by continued statements at their meetings. At the Annual General Meeting of the Westminster Co. on Wednesday last week, Mr. J. Browne Martin, the Chairman of the Company, said that unless the L.C.C., the Local Authorities, and the supply companies could be brought together in one scheme, no satisfactory result was ever likely to be arrived at. A shareholder asked if it was true that the proposals in the Bill would mean adding about £1,000,000 of "water" to the capital of the London companies. Sir Alexander Kennedy, Engineer-in-Chief to the Company, who was asked to reply, said that the present capital of the London companies is about £15,000,000. It was suggested, he said, to add a further four or five million pounds to erect a new station, and another four million pounds for other purposes, and some £4,000,000 worth of plant would have to be "scrapped."

On the same day, meetings of the Kensington and Knightsbridge and Notting Hill Companies were held, and Colonel Crompton, presiding at the first-named, said that although they were all desirous of securing an extension of the life of the companies, careful watch must be kept on the terms upon which this should be granted. Sir William Crookes, at the Notting Hill meeting, contented himself with assuring the shareholders that the directors were closely guarding their interests.

On Friday, at the meeting of the Charing Cross Co., Mr. W. Fladgate, the Chairman, referring to the economies in generation which were claimed under the proposed amalgamation scheme, pointed out that the estimates of revenue were on the assumption that the present selling prices would be maintained, but no bulk scheme could be sound which did not assume a decrease in price. On the engineering question, none of the London companies at present felt competent to express a definite opinion, as the joint committee of experts under the Chairmanship of Sir Alexander Kennedy, were still conferring with the promoters' engineers. In the various Power Bills for London in the past, the future requirements of London had been greatly exaggerated, whilst the capacity of the existing companies to deal with the increasing demand had been greatly under-estimated. The work of unifying electric supply in London must be a gradual one, and could be done at a comparatively small cost by agreement among the interested parties, which would be better and more convenient than throwing the industry into the melting-pot, and calling in the aid of the millions of the financier. Incidentally, he mentioned that the promoters seemed to have provided for a profit to themselves of well over a million. Messrs. Slaughter & May, in a letter to *The Times*, stated that Mr. Fladgate's remarks are "seriously inaccurate"; Mr. Fladgate thereupon challenged the production of figures to disprove them, but his challenge has not yet been taken up.

The second reading of the Bill has been deferred until March 16th.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,381.

On accumulator switchboards for lighting installations, the charge and discharge regulating switches for the end cells are often interlocked, so that there cannot be more cells in the discharge circuit than in the charge circuit, at any time. Why is this?

(Replies must be received not later than first post, Thursday, March 12th.)

### ANSWERS TO No. 1,379.

It is required to bring a voltage of 275 A.C. down to 250. Is a choking coil the right solution? If so, give full particulars necessary to make one for a full-load current of 40 amperes at 50 cycles.—"SPARK."

The first award (10s.) is given to "M. M.," for the following reply:—

Of the three practical methods available—transformer, auto-transformer, and choking coil—the choice will be between the two latter. Some would prefer an auto-transformer for the purpose specified, considering there is so small a difference between the impressed and the useful voltage. On the other hand, if the load has a poor power factor, or if arc lamps are

FIG. 1.

used, a choking coil would probably be the better. The following is suggested as an outlined method of designing a choking coil to the given data.

Reactive voltage of the choking coil must

$$= \sqrt{(275)^2 - (250)^2} = 115 \text{ (approx.)};$$

then  $115 = \text{total flux} \times 4.44 \times \text{turns} \times \sim \times 10^{-8}$

With a sectional area of core, 3 in.  $\times$  2 in., and taking 85 per cent. as being actual iron, net iron area =  $3 \times 2 \times 0.85 = 5.1$  sq. in. With a density of 58,000 lines per sq. in., the total flux =  $58,000 \times 5.1 = 295,800$ .

We then have that the number of turns

$$= \frac{115 \times 10^8}{295,800 \times 4.44 \times 50} = 175.3 \text{ (approx.)}.$$

To carry 40 amperes will require No. 4 S.W.G., and this, when double cotton covered = 0.257 in. in diameter. If we allow for eight layers of twenty-two turns each, four layers on each limb, winding space must be  $0.257 \times 22 = 5.65$  in. For convenience in winding and insulation let this be made 6 in.

Fig. 1 gives a suggested arrangement. The yokes are divided into two parts, these halves being bolted to the cores. Between the upper yoke pieces and cores are insulating packings; these are marked black on the drawing.

The thickness of these packings can be altered as required, thus affording a convenient means of regulation. The length of the magnetic circuit is 26 in. (approx.); at the above density of magnetic lines this will mean 9 amperes per in., i.e.,  $9 \times 26 = 234$  ampere-turns. Therefore we have left over for the air-gap  $(40 \times 176) - 234 = 6,806$

$$\text{air-gap} = \frac{\text{ampere turns}}{0.313 \times \text{flux density}} = \frac{6,806}{0.313 \times 58,000} = 0.374.$$

As we have the total air-gap divided into four, each packing may be made 0.1 in. in thickness; this will give sufficient means of regulation by altering thickness as may be required. The iron losses will be about 85 watts, C<sup>2</sup>R loss about 64 watts; this giving an efficiency of 97 per cent. (approx.). With a ventilated case rise in temperature will be about 70° F. The arrangement of the yokes can be altered to suit circumstances; for instance, the lower yoke could be interlaced at the joint with the cores, and the top yoke in one piece with the two air-gaps, &c.

The second award (5s.) is made to "Auto," who writes as follows:—

"Spark" will find an auto-transformer best suited to his purpose. A choking coil would serve if the load is constant, but the volts on the load would vary with the load unless the choker was made adjustable, which may be inconvenient. A suitable auto-transformer would be constructed as follows:—

**Core.**—2 in.  $\times$  2 in. cross-section, worked at about 50,000 lines per sq. in., of, say, Lohys transformer plates laid up in the usual way and of dimensions shown in Fig. 2.

**Winding.**—Before assembling limbs, serve each with a layer of tape, and then two layers of press pahn 0.010 in. thick.

FIG. 2.

FIG. 3.

Over this wind each limb with 285 turns 0.072 in. diam. copper D.C.C., winding the first layer 6 in. long, and piling the winding. Over this wind twenty-eight turns of taped copper strip 1 in.  $\times$  0.08 in. or equivalent section. The limbs may then be assembled with the yoke stampings, and coupled up so that the circuit shown in Fig. 3 is obtained. Neglecting the small magnetising currents an examination of the auto-transformer principles (see any text-book) shows that at 40 amperes load on the 250-volt side the currents in the circuits are as indicated in Fig. 3. It will be observed that half of each section is wound on each limb, this being necessary in order to avoid excessive leakage. The above auto-transformer would run quite cool and would be suitable for total enclosure. If it is to run open, the copper sectional areas can be cut down.

**The Institution of Electrical Engineers.**—The following is the result of the ballot for new members, and transfers from one class to another, at the meeting last Thursday:—*Elected as Associate Members:* G. H. Browne, G. M. Harvey, P. M. Hogg. *Graduates:* A. D. Church, I. Day, W. S. Finlason, J. V. Levett, P. M. Millns, H. A. Morris, W. T. Parr, J. D. Ravenscroft. *Students:* E. Balmford, M. H. Bhatt, C. R. Bolton, C. W. Boxall, C. A. Coombs, R. de Hollanda, R. Gates, K. N. Ghose, E. P. Gillman, S. J. Grose, T. H. Hall, H. J. Hardie, N. Haws, A. S. Hopkins, H. Hornoyd, C. W. Jardine, C. S. Knight, H. J. McKenzie, C. A. Morton, E. T. Panton, W. S. H. Palmer, W. Richardson, C. E. Saster, F. J. Tindall, H. J. Tolley, R. I. Wells, H. Woodside, C. N. Young. *Candidates Transferred from Associate Member to Member:* J. H. Butters, J. A. Sykes. *From Graduate to Associate Member:* W. T. Golden, A. A. Maytham. *From Student to Associate Member:* I. **San Francisco Electrical Congress, 1915.**—The following have been nominated as Honorary Members of the Committee on Organisation of the above Congress, by Mr. C. O. Mailloux, President of the American Institute of Electrical Engineers:—Lord Rayleigh, Sir Charles Parsons, Sir Oliver Lodge, Sir J. J. Thomson, Dr. R. T. Glazebrook, Dr. Silvanus P. Thompson, Mr. W. Duddell, Dr. Gisbert Kapp, Dr. S. Z. de Ferranti, Prof. J. A. Fleming, Mr. W. M. Mordey, Mr. Alexander Siemens, and Col. R. E. Crompton. Honorary Members representative of all the countries in which a National Committee of the I.E.C. is established are also being appointed.

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

### THE SENGHENYDD COLLIERY DISASTER

THE Home Office inquiry into the circumstances of the explosion which occurred in the Universal Pit, Senghenydd, South Wales, on October 14th last, has been continuing during the past month, and some interesting evidence has been given by electrical experts since the matter was referred to in our section on "Electrical Engineering in the Mining and Metal Industries," of February 5th (page 79). On Thursday, February 5th, the possibility of sparks from the signal wires causing an ignition of gas was further investigated. Mr. C. Wadden, the Colliery Electrician, stated that they had never used a pressure higher than 9 volts on the signal circuit, which he did not believe could cause an explosion; he regarded 18½ volts, however, as dangerous. Mr. W. Schielbach (Consulting Engineer) agreed that 9 volts could not cause an explosion, but in view of the fact that an ignition had been obtained with 11·9 volts, would recommend a lowering of the voltage. During the luncheon interval experiments were performed by Prof. W. M. Thornton (Armstrong College, Newcastle) to show that if a bell were shunted with a high resistance bye-pass, all danger of ignition was removed. In these experiments a pressure of 11 volts was used, and a mixture of town gas was fired as soon as the bye-pass was removed. The most important witness of the day was Mr. C. P. Sparks, Consulting Engineer, who gave it as his opinion that the use that they were making of electricity in the pit could not be responsible for the explosion. If the explosion had originated in the bell-box, the covering of the coils would have been singed; but this was not so. He then proceeded to give a full account of the tests that had been made on January 1st and January 27th at New Tredegar to ascertain the degree of danger of ignition there was from signalling circuits of various voltages under various conditions.

The first series of tests was made with bells in an explosive 10 per cent. mixture of fire-damp, obtained from the Cymmer Pit. Tests with 6 and 9 "Dania" cells, 9 and 13½ volts respectively, failed to ignite the gas when these cells were connected to the bell circuit without any resistance equivalent to signal wires. In the nine cell tests the current in the bell was 1·64 amperes maximum, as compared with 1·1 ampere at 9 volts in ordinary working. In the next tests a 10 per cent. mixture of town gas and air was used, which was immediately ignited by the bells from the Senghenydd Pit and New Tredegar rescue station with 13½ volts without signal wire resistance. Tests with the fire-damp mixture were then made with higher voltages, and ignition was obtained with 18 volts on the eleventh attempt, and with 22½ volts on the ninth attempt. Further tests with several different bells with 9, 10, and 12 volts were made, but in no case was the mixture fired, although the bells were kept ringing continuously for over 19 minutes. Another series of tests was made with No. 11 S.W.G. galvanised iron signal wires suspended vertically in the testing chamber; 13½ volts were used, and a continuous series of intermittent contacts were made between the signal wires with an iron knife edge, and after 30 or 40 seconds the mixture was ignited in one case, and after 14 minutes in another case. Similar tests at 9 to 12 volts with the Senghenydd bells failed to ignite the mixture, although carried on for nearly two hours; but in one case with 12 volts on the New Tredegar bell, ignition was obtained. It has been pointed out, however, that the tests with New Tredegar bell have little bearing on the inquiry, as it is of a different type from those used at Senghenydd. In all the tests the conditions were such as to secure maximum conditions of sparking with a given pressure. It will be seen that in no case was ignition of fire-damp obtained with a pressure lower than 12 volts for the signal wire experiments or 15 volts for the bell experiments, although the town gas mixture ignited more easily.

Mr. Sparks was satisfied from these experiments that the working pressure of 9 volts was insufficient to cause ignition of fire-damp, but agreed that the matter should be further gone into in the interests of safety, as this class of risk was not sufficiently fully realised. He recommended an alternating current system of signalling as safer still. Dr. Thornton then gave evidence to the effect that fire-damp was about twice as difficult to ignite as house gas. By the use

of a bye-pass to the bell the danger could be reduced to a negligible quantity without affecting the ringing of the bell. The present regulation fully met the case for safety; if open sparking were prevented it would be perfectly safe. [In this connection it may be remarked the present rules throw the onus on the management of deciding at what point "open sparking" becomes dangerous. Under the old rules for signalling apparatus, 15 volts were allowed under all conditions.]

On the following day Mr. Robert Nelson (H.M. Electrical Inspector of Mines) was called, and described his inspection of the electrical apparatus in the pit, and also referred to the New Tredegar experiments. In these they had not succeeded in getting an ignition with the conditions which were the actual conditions at Senghenydd. He held, however, that there was not sufficient evidence to show that 9 volts was beyond danger, and that the margin of safety between 9 and 18½ volts was altogether inadequate. His view was emphatically that in parts of a mine where naked lights were prohibited, all electrical apparatus should be completely enclosed, so that open sparking would be impossible. Questioned on the definition of "open sparking," he said that when the regulations were being discussed, the Committee assumed that any visible spark could ignite gas, but Dr. Thornton had since shown sparks that would not ignite gas, and he himself still mistrusted all sparks that were visible. He thought that in this respect exemption of existing apparatus from the new regulation should be withdrawn, as the old regulation had proved ineffective.

The sittings on February 9th, 10th, and 11th did not deal with electrical matters. On February 12th Mr. Watts Morgan, who took a prominent part in the rescue operations, expressed the opinion that open signalling wires should be prohibited, and that lamp stations should not be permitted underground. Electric re-lighting apparatus should be in charge of a competent man. One of the witnesses on the following day was Dr. W. N. Atkinson (Inspector of Mines), who believed that gas came away from a fall, and was ignited by a spark from the electric signalling or from falling stones or rocks. Pending further investigation, he would prohibit the use of a signalling voltage above five or six. The hearing of evidence was conducted on February 13th, but representatives of various interested parties addressed the Commissioner and the Assessors at the Home Office on February 20th. Among these, Mr. Brace, speaking for the South Wales Miners' Federation, took the opportunity of airing his well-known views that electricity should not be permitted for hauling, signalling, or lighting unless surrounded by the most rigid safeguards. He submitted, however, that electric lamps should be in general use in all dry and dusty mines. Mr. Nicholas, for the Miners' Federation, said that he failed to see why those combatting the theory that the signalling wires could have caused the explosion should have gone to the great trouble of demonstrating that the signal wires were not in use. He did not think that the court could be satisfied as to the voltage in use at the colliery; open sparking ought to be more clearly defined. The Hon. Trevor Lewis, who appeared for the manager, submitted that on the evidence of the voltage and the tests, there was no risk of open sparking. The inquiry then terminated.

**The Need for Electric Safety Lamps in Mines.**—One of the proposals considered and adopted at the meeting in Cardiff at the beginning of last month of the Miners' Federation, with the object of inducing the Government to amend the law so as to provide further protective measures against accidents, was worded as follows:—"That we press for the use of electric lamps in mines, provided that a gas testing-lamp is available for use in every working place." The congress was presided over by Mr. W. Brace, M.P., who referred to the matter in Parliament during the debate on the Address on Feb. 12th in connection with the amendment dealing with mining and railway accidents. He then pointed out the great drawback to a miner was the lack of light wherewith to defend himself. The electric lamp, however, while it gave a better light, failed to discover the gas, hence a certain number of oil gas testing-lamps must be used as well. Another proposal seeking to prohibit the use of electricity for motive power in mines is dealt with in another column.

## MINERS' SAFETY LAMPS

THE design and maintenance of miners' electric safety lamps were treated in a Paper which Mr. F. J. Turquand read to the London Branch of the Association of Mining Electrical Engineers on February 6th. The Paper was briefly discussed, and will be further discussed at the other branches of the Association. Among the advantages of aluminium alloys, said the author, they did not rust, and acid corrosion was not so injurious to the battery, while the sulphates were easily and permanently removed by cold water. A thick casting did not dent or distort so easily as steel, and could be remelted if required. The alloys were not, however, hard enough to provide friction surfaces or fastenings, but brass, gunmetal, or steel pieces could be cast on, and would remain tightly fixed owing to the relative contraction of the various metals. The usual method adopted to protect the lamp-bulb was to mount it on spring-, air-, or rubber-cushioned contacts. The surrounding glass should be as thick and strong as possible. The dome-shaped glasses generally used had the advantages of strength and of leaving only one edge to seal against leakage. The author continued: "When using blown glasses of this description purchasers should be careful to have thoroughly annealed glass, as only when this is properly done can the glass be safe to use. It is an interesting fact that if one takes a badly annealed dome-glass and just shakes an ordinary tin-tack about inside, it will crack badly. When the right quality of glass, properly annealed, is used, however, it is sometimes difficult to smash a dome glass with a hammer." There were broadly, he said, three methods of holding the glass dome on to the base of the lantern, viz., (1) by pressure upon the dome; (2) a flange cast round the base of the glass, or (3) by cementing a metallic ring on to the edge of the glass, which ring could be screwed or otherwise attached to the case of the lamp. When it was thought desirable to convert the dome top into a lens, that could be effected by either thickening the glass in casting or blowing, or using a glass cylinder with a lens cemented or otherwise attached to the top. It was said to be possible to obtain slightly clearer glass in cylinder form, like the oil-lamp glasses, than in the dome-shape, which was blown into a mould.

The author dealt with the action and construction of primary, lead, and alkaline batteries, and with regard to the design of the battery case, usually made of transparent celluloid, his experience emphasised the importance of providing a substantial base to the cell in all cases where this was removed from the outer case for charging, and also the use of resilient material for supporting the electrodes in the cell rather than the celluloid or ebonite feet frequently employed. He estimated the average life of a secondary battery in a miner's lamp in practice at about 500 charges and discharges—about twelve months. The main points in erecting a miner's electric lamp charging and repair installation were: (a) A supply at constant voltage through a properly erected and maintained circuit; (b) accurate circuit and testing volt- and ampere-meters, including a main-circuit recording volt- and ampere-meter, which should be recalibrated periodically, and have frequent sub-section fuses; (c) strong benches and charging racks completely covered with stout lead or glass sheet; (d) facility for washing down with a hose and quick drainage. It had been found from experience that the average life of 2-volt metal filament lamps was 600 burning hours—or when working four shifts per week, about three months—and that it was desirable to test all the bulbs individually through a long scale ammeter. Lamps should also be periodically tested for c.p. and voltage on closed circuit at the expiration of an ordinary shift.

Most of the lamps now available have been described in *ELECTRICAL ENGINEERING*, but in addition the following lamps have recently passed the Home Office tests:—The T.K. lamp, supplied by the General Electric Co.; the Varta lamp, supplied by the Cremer Lamp and Engineering Co., of Leeds; and a new form of Stach lamp fitted with a flame gas detector.

In the T.K. lamp the glass dome, which stands on rubber, is secured by an inverted truncated cone-shaped ring fitting the dome at the lowest part of its curve. To lessen the effect of upward or downward blows, two of the four pillars which hold down the metal ring pass through the roof of the connection chamber and are fixed by rubber-cushioned nuts. The other two pillars rest on cushions in recesses on the top of the connection chamber. By the use of fine-bore tubes the gases can escape, while the small amount of fluid contained in the tubes drops into a non-spillable drainage chamber. The fluid can be squeezed back into the battery when it is inverted. The Varta lamp has a stout, seamless, stamped-steel case with vertical ribs. The grooves for locking the lamp and securing the battery are also pressed in the case. A stamped-steel lamp-top, strengthened at

the joint, which, when greased, is watertight, a screw-cap bulb with terminals and wires wide apart, contact plates on the rotating cover, and a circular celluloid battery case with rubbered interior. Planté positive and pasted negative plates are used.

The alkaline battery miners' lamps now, or about to be put, on the market, said the Author, were the Wolf, Edison, Woranop, and the G.E.C. The Worsnop lamp uses the Alkum accumulator (*ELECTRICAL ENGINEERING*, Nov. 7th, 1912, p. 625, Vol. VIII.). The lamp case is of steel. A lens above the lamp-bulb gives a concentrated beam. A screw switch is provided. In the new type of Wolf lamp a pressed-steel case is used. The battery case is of sheet nickel. The lamp-glass is cylindrical, and a shunt resistance, which is thrown into circuit should the lamp be broken, does away with the possibility of gas ignition due to the glowing filament.

During the discussion Mr. W. Maurice (General Manager, Hucknall Torkard Colliery, Notts) expressed the opinion that the dome glasses were almost invariably streaky. His impression was that the rotating switch-plate form of switch was being adopted, to the almost total exclusion of other types. He could not agree that the life of accumulator lamps was about 500 shifts. A life of about half this was usually obtained. The alkaline cells with which he had had to do had not given the life expected, as it was found in practice that the iron in the electrodes became oxidised if the level of the electrolyte was allowed to fall. The portions oxidised became and remained ineffective. He thought that the figure of 2,000 charges and discharges given in the Paper was much too high. Mr. Haslam said that in Germany, he believed, great trouble had been experienced with aluminium cases owing to salt water in the pits. The method suggested of casting on brass, gun-metal, iron, or steel rings was not satisfactory. Dome glasses, he said, could be obtained which were quite as clear as any cylindrical glass. There was not the slightest doubt that the screw-top switch was gradually being eliminated, and it would not be very long before all the lamps underground had the revolving top or sliding contact. He had found that positive plates lasted between 8 and 12 months, negative plates about twice as long, but the casing lasted until destroyed by human agency.

During the discussion at a meeting of the North Stafford Branch of the Colliery Managers' Association and the Lancashire, Cheshire, and North Staffordshire Branches of the Association of Mining Electrical Engineers on February 14th at Stafford, Mr. Wm. Maurice said that if a lamp passed the official test and became approved, it was by no means a guarantee that it was sound enough for a colliery to adopt. The mechanical test was only a drop test, and it was not required that the battery be in the case at the time that the test was made. Although it was possible to make a lamp as light as 4 lb. in weight which would pass the Home Office tests, such lamps would be fairly costly in renewals. A lamp of 5 lb., which was a fair average weight for well-constructed lamps, was found in practice not to be objectionally heavy. He urged that the only safety device required was that inherent in careful design, suitable material, and first class construction, since it was now definitely established that a spark at 4 volts was quite safe, and that 10 or 11 volts was perfectly safe for main road signalling. Dr. Lister Llewellyn agreed that an extra pound or two in weight made little difference, but it was important that the light be as much as possible, as in the better illumination of mines lay the remedy for miners' nystagmus. Colliery managers must not be disappointed if nystagmus still occurred in the next few years, because there were probably latent cases which would develop, but he hoped that with the introduction of these lamps permanently the disease would become almost negligible.

**Telephones and Home Office Rules.**—Some mines have misinterpreted the Home Office Rule which provides that "where electricity is used for signalling, the pressure in any one circuit shall not exceed 25 volts," and have thought that it applied to telephones in mines. The matter has been taken up by the Telephone Manufacturers Association, and we are officially informed that the Rule relates only to signalling, and not to telephones.

**Large Ilgner Winding Set.**—The North Butte Mining Co. has ordered an Ilgner winding set for its new Granite Mountain shaft. According to the *Electrical Review* and *Western Electrician* (Chicago), this will be the largest electric winder in America, and one of the largest using the Ilgner system of power equalisation in the world. The winding motor will have a maximum intermittent rating of 4,500 h.p. at 71 r.p.m., and the motor-generator set will be driven by an induction motor of 1,400 h.p., continuous rating. The flywheel will weigh 50 tons. The winding drums will be 12 ft. in diameter, and the rope  $1\frac{1}{2}$  in. in diameter. The rope speed is to be between 2,700 and 3,000 ft. per min., and the skips will hold seven tons. The shaft will ultimately be 4,000 ft. deep, and the winder will deal with 200 tons of mineral per hour from this depth, or 300 tons from the 2,000-ft. level.

## ELECTRIC PUMPING PLANT AT A KENT COLLIERY

A PAPER by Mr. H. J. Wroe, read before the London Branch of the Association of Mining Electrical Engineers on February 6th, described the electric pumping plant which was installed at the Tilmanstone Colliery, East Kent, for coping with water during sinking operations, to replace the original steam pumps which were not of sufficient capacity. The increase in the amount of water and the bursting of two pipes in the delivery column of the original pumps had resulted in the shafts becoming flooded to the 600-ft. level. The electrical pumping plant put in for unwatering the shafts consisted of a horizontal Sulzer centrifugal pump direct-coupled to an A.E.G. 8,000-volt three-phase 50-cycle motor in an inset at the 600-ft. level, provided with suitable waterways and cable ducts, and two Sulzer four-stage centrifugal sinking pumps, each capable of delivering 1,200 gallons of water per min. against a head of 870 ft., suspended in the shaft on steel-wire ropes. Each pump was coupled by an elastic coupling to a totally enclosed three-phase squirrel-cage motor, capable of developing at 8,000 volts 50 cycles a continuous output of 500 b.h.p. at a synchronous speed of 1,500 r.p.m. The upper bearing of the motor carried the weight of the rotor, the weight of the pump shaft and impellers being taken by a step bearing on the pump.

The leading characteristic of the motor design was the combination of air and water cooling, the rotors being fitted with fans which equalised the temperature in the interior of the motor, and prevented the formation of heat pockets. The stator windings were water-jacketed. The control of the fixed horizontal pump and of two sinking pumps was carried out from a switchboard mounted in the 600-ft. pump room, consisting of ten switch pillars built of sheet-steel and totally enclosed. Three of these were feeder pillars; one was provided for the horizontal-pump motor, and two pillars for each of the sinking-pump motors. The two remaining pillars were provided for motor drying-out, one being occupied by the necessary switchgear, the other containing a 150-k.v.a. step-down transformer fitted with tapings on the low-tension side. Each sinking-pump motor was started by its own transformer, contained in a separate pillar, the adjoining pillar being provided with an oil-switch, isolating links and instrument transformers. The oil-switch was also fitted with overload and no-volt releases (the latter being interlocked with the starting transformer), and further with an emergency stopping switch fixed on the frame of the sinking pump. Owing to these interlocking connections, it was impossible to close the motor oil-switch unless the starting transformer was in the starting position; but in case of emergency the motor could be stopped instantly by opening the emergency switch fixed on the frame of the sinking pump. The breaking of the emergency switch trips the oil-switch on the pump-room switchboard. The cables for the sinking-pump motors were carried from the switchboard along the water ducts to the cable drums, connection to the latter being made through slip-rings mounted on the cable-drum shafts. The pilot cable for stopping either sinking-pump motor was also carried in a similar manner to a small cable drum. Some considerable difficulties were introduced, due to the very sandy character of the water, which caused rapid wear of the working parts of the pumps.

Operations with the electric sinking pumps were confined to No. 2 shaft, and when the water had been lowered sufficiently, the steam pumps at the 1,140-ft. inset were recovered, and were set to work. Meanwhile a new inset was made from No. 3 Pit at the 1,140-ft. level, and three electric pumps with suitable switchgear were installed. These pumps, also supplied by Sulzer Bros., were of a special horizontal stationary six-stage type, each rated for at 1,000 gallons per min. against a head of 1,300 ft.

Each pump was coupled by an elastic coupling to a three-phase ventilated enclosed 8,000-volt 50-cycle slip-ring motor, with a continuous output of 680 b.h.p. at a synchronous speed of 1,500 r.p.m. The motor was started by a liquid starter, and the bearings are ring-lubricated and water-cooled. The switchboard was very similar to that at the 600-ft. inset, and consists of three feeder panels, three motor panels, one spare motor panel, one transformer panel containing a 150-k.v.a. step-down transformer, and one transformer switch-panel.

When the coal measures were reached, the water was

tubbed out of the shafts, and then the conditions for the pumps improved greatly. The quantity of water to be dealt with has since fallen off considerably, and arrangements are being made for altering the pumps, so that one will easily deal with the whole. During the sinking and unwatering operations, which lasted ten months, not a single stoppage of the electricity supply occurred, and, further, the sinking pumps and motors, in spite of the onerous conditions under which they worked, were used alternately in such a way that pumping was carried on continuously.

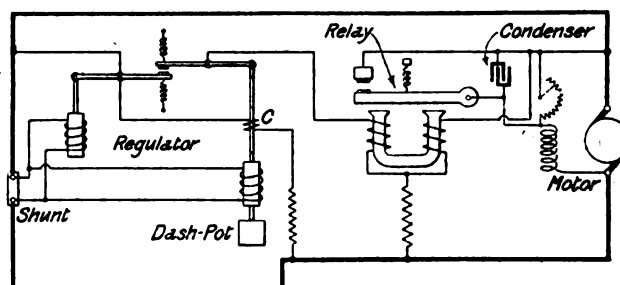

## ELECTRICAL MINING AND METALLURGICAL PATENTS OF FEBRUARY

### Mining.

THE patent specifications published by the Patent Office during February included the following, of particular interest to mining electrical engineers. In No. 2,872/13, T. Attwater (Brighton) describes a safety lamp of light weight. The casing is a cylindrical, aluminium casting, and at the top is provided with an external thread for a split flanged locking-ring fitted with a clamping screw worked by a key. Two or three incandescent lamps are mounted on a vulcanite disc base in a glass tube on the outside of which is a metallic cage integral with the top cover plate, and a lower flange and ring supporting the vulcanite base. Two spring terminals are provided, and the switching is done by a push switch by means of a plunger passing through the casing. In No. 28,634/13, Bickford, Smith & Co., Ltd., and W. N. B. Smith (Cornwall), claim a blasting fuse in which the firing wire passes through a hole bored transversely through the fuse and passing through its axis. The hole is filled with a priming material and covered with a waterproof insulating material.

### Metallurgical.

The following patents are of special interest to electro-metallurgists. In specification No. 22,159/13, A. Hiorth (Christiana, Norway) claims the arrangement in induction furnaces, of the disc transformer type, of one primary coil of smaller and the other of larger diameter than the annular melting bath. The centre line of this lies on the conical surface through the centre lines of the upper and lower

CONNECTIONS FOR ELECTRICALLY-DRIVEN NON-REVERSING ROLLING MILL.

primary coils, so that the surface of the melting bath may be easily accessible. In No. 6,285/13, the British Thomson-Houston Co. claims the control arrangement for non-reversing rolling mills shown in the diagram. By this means, if the current in the shunt rises, the action of the regulator coils will increase so as to cause the contacts to approach and release the relay armatures and short-circuit the rheostat. The field being thus augmented, the current falls and the regulator contacts are again separated. The small coil connected across the motor terminals causes the current regulated by the regulator to be increased or decreased, according to its relation to the coil underneath it. This specification was communicated by the French Thomson-Houston Co. In specification No. 3,046/13 a magnetic separator is described by Bowes, Scott & Western, Ltd., and I. S. Dalgleish (London). The magnet poles are excited by a pulsating or alternating current. The magnetic particles descend by gravity between the successive attractions to the poles. An upper pole is arranged to separate the material supplied, so that it falls in magnetically separated streams, which then come under the influence of a lower pole.

# THE "HATFIELD" PUMP

Merryweathers' Patents.

*A Client writes:—"The 'Hatfield' Pumps at this Hotel are particularly successful, especially as regards their silent working. In many hotels one stops at, you can hear the hammer of the pumps vibrating through the whole building, which is very irritating to visitors. Many a comfortable night a man spends in his bed at this Hotel, without being disturbed by 'the thump of the pump.'"*

### ELECTRICITY IN MINES

A PAPER dealing generally with the subject of electricity in mines, by Mr. R. Nelson (H.M. Electrical Inspector of Mines), was read at a meeting of the North Staffordshire Institute of Mining and Mechanical Engineers, on February 2nd. The Paper was addressed particularly to colliery managers, and was to some extent supplementary to a previous communication on the subject. Mr. Nelson, in comparing different systems of distribution, said that, although the cables for a continuous-current system cost about 30 per cent. less than for a corresponding three-phase system, the former system was one of limited range only. The three-phase motor had advantages in respect of cost, better mechanical construction, lower maintenance cost, greater overhead capacity, and, in the case of squirrel-cage machines, no rubbing contacts. On the other hand, continuous-current motors dealt better with a heavy load at starting, and could run economically at varying speeds. The most important requirements for safety in working electrical plant underground were: Strong metallic outer coverings for all apparatus to protect insulating material from abrasion, to prevent accidental contact by persons with live parts, and to prevent open-sparking; efficient connection to earth for the metallic outer coverings; and provision for making a faulty circuit dead automatically immediately leakage of current developed. The last mentioned was more conveniently provided for with the three-phase system if the neutral was earthed. Finally Mr. Nelson expressed the opinion that "with the appliances in present use, three-phase working appears to possess substantial advantages over continuous-current working." In the last portion of his Paper Mr. Nelson took the opportunity of urging strongly that the principle of enclosing all apparatus in a strong metallic outer covering should be applied equally to light as well as to heavy apparatus—that is, to the cables and fittings for electric lighting circuits, to telephone and signalling apparatus, and to all cables used in conjunction with such apparatus.

In the course of the discussion most of the speakers agreed as to the superiority of the three-phase system, although some successful continuous-current installations were referred to. On the other hand, the earthing of the neutral was objected to by Mr. J. R. L. Allott, because if anything happened on one phase he could keep going, whereas if the neutral were earthed, he would have to stop the pit while it was put right. Mr. Nelson in his reply denied that this was a real disadvantage, and strongly objected to running with a fault on the system. Mr. J. Gregory, however, asserted that it was not essential to earth the neutral to provide for opening the circuit in case of leakage. He also referred to the unsuitability of the squirrel-cage motor for haulage, and was about to experiment with epicyclic gearing for taking up the load gradually.

### THE CAMPAIGN AGAINST ELECTRICITY IN MINES

AT a meeting of the Miners' Federation at the beginning of last month, under the Presidency of Mr. W. Brace, M.P., a number of proposals with the object of inducing the Government to amend the law in order to secure further protective measures were discussed. Sixteen proposals were adopted (one of which, dealing with electric safety lamps, is referred to in a note in another column), but the most serious, from our point of view, a proposal to prohibit entirely the use of electricity in mines, was deferred for further consideration at the annual conference of the Federation this month. Mr. Brace, who is carrying on an active campaign against electrical working in mines, found a further opportunity of expressing his views in the course of the debate on the Address in the House of Commons on February 18th in connection with the amendment proposed by him regretting that no mention was made in the King's speech of the "serious and increasing number of accidents in mines and on railways, and that no action for dealing therewith is proposed." After dealing with a number of other mining matters, Mr. Brace urged that with the introduction of electrical working, a "tremendous risk" was brought into the mines, and quoted a remark of the late Mr. Pickering that electricity had brought a new danger into the mines of the country. He referred to the disasters which had occurred during the last five years, and without further argument asserted that "when electricity was not used in the mines these terrible disasters did not take place." He even instanced the Senghenydd accident, which has by no means been proved to be due to electrical causes. Continuing, he said "we had become, long before electricity was introduced, per head of the population, the greatest coal-producing nation in the world, and there is really no industrial reason why electricity should be used in our mines." Mr. Ellis Griffith (Under-

Secretary for the Home Department) reminded Mr. Brace that the Senghenydd disaster was still under investigation, and he could express no opinion on it. "The controversy is," he continued, "whether, for the sake of the safety of the mines, electricity should be used or not. My Hon. Friend thinks it should not, but I can assure him that a great many people take the contrary view. The Senghenydd inquiry will do something to throw light on the question." The amendment was lost.

### AN EXPLOSION-PROOF GATE-END SWITCH

WE are able to illustrate here, by the kindness of A. Reyrolle & Co., Ltd. (Hebburn-on-Tyne), a pattern of gate-end switch which they manufacture in large quantities for underground work. The apparatus consists of one of their standard three-phase, 500-volt, 50-ampere, explosion-proof, oil-break switches, combined with a dividing box, with gland for armoured cable at one end, and at the other end there is fixed a watertight plug and socket. The plug is interlocked with the handle of the switch, so that the plug

EXPLOSION-PROOF GATE-END SWITCH.

cannot be withdrawn or inserted while the switch is in the "on" position. If necessary, the switch can be used as a gate switch, and can be fitted with either a watertight plug at each end or a dividing box at each end, instead of one box and one plug, as shown. Also, the dividing boxes can be vertical or horizontal type. The whole arrangement is very compact, and, at the same time, is sufficiently strong mechanically to withstand rough usage. They are issuing a pamphlet (No. 193) dealing with this switch, and will be happy to forward copies to any of our readers on hearing from them.

**Electricity in Coal Mines.**—We have received from the British Thomson-Houston Co., Ltd. (Rugby), a copy of a very finely produced and illustrated pamphlet on Electricity in Mines, a subject in which the Company have a large amount of experience. In addition to interesting descriptive reading pointing out the tendencies of modern electric mining practice, there are many illustrations showing features of actual installations carried out by the B.T.H. Co. These include steam turbo-generators and switchboards in colliery power stations, special mining substation switchgear, electric winding plants (with and without flywheel load equalisation), motors and special gearing for driving screening plant, main rope surface haulage plants, underground main and tail and endless rope haulage gears, electrically-driven pumps, &c. The special types of mining induction motors illustrated, with attached trifurcating boxes, enclosed slip-rings, and ventilated stators, are particularly interesting, and the whole publication, besides pleasing the eye, gives a good idea of the thoroughness with which the Company have dealt with the special problems involved in mining electrical engineering.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Feb. 26th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in *italics* indicate communicators of inventions from abroad.

2,836/13. **Enclosures for Projector Arcs.** H. AYRTON. The enclosure, or "lamphouse," is made of wire gauze or perforated metal with asbestos or similar cover. This may be attached to the gauze, close to it, or is preferably stretched on a frame at some distance. By this means the interior of the enclosure is kept cool, with ample, but symmetrical, ventilation. Two figures.

4,926/13. **Magazine Arc Lamps.** J. BROCKIE and JOHNSON & PHILLIPS. Each magazine has a double carbon holder movable in the plane of the magazine, so that it can be brought automatically into position opposite the next pair of carbons for duty, while the stumps of the previous pair are still burning. Four figures.

5,150/13. **Malleable Tungsten.** J. CANELLO. The finely divided metal is mixed with a small quantity of nickel, together with glycerine, to act as a binding agent. The mixture is then compressed, slowly dried, and afterwards sintered in an electric furnace. The furnace is water cooled. Two figures.

8,173/13. **Printing Telegraphs.** H. KAEHLER and P. KAEHLER. This apparatus is a combination of parts of the Hughes and Murray. Broadly, a type-wheel apparatus is used for receiving the impulses sent by type-wheel apparatus operated by hand or automatically. The receiver is so constructed that simultaneously a strip is perforated and a telegram printed. The strip is suitable for automatic delivery or transmission in a corresponding apparatus, and the printing and perforating devices are mechanically connected, and the perforated strip provided with holes, whose distances apart correspond to any suitable scale to the distances between the signs on the type-wheel represented by the holes. Seven figures.

11,540/13. **Detecting Icebergs at Sea.** F. KRÜGER. Heat radiated from the iceberg is focused by a concave mirror on to a surface thermopile, or surface bolometer. This is connected to a moving coil, electro-magnetic Wollaston wire, or similar galvanometer, such as an Einthoven galvanometer.

15,728/13. **Recording Instruments.** SIEMENS BROS. (*Siemens & Halske A.-G.*). Rows of different characters are arranged across the path of the record strip, and adapted to be changed intermittently, so that the various values are recorded by different types of signs. Seven figures.

16,890/13. **Railway Signal Interlocking.** SIEMENS BROS. and W. E. SCOURFIELD. The locking bolt is capable of moving, relatively to the armature of the controlling magnet, to or from its operative position, whilst the armature is held by the magnet. The locking bolt is mechanically thrust positively into the locking position at each movement of the locking bar. Two figures.

18,517/13. **Insulating Conductors.** J. A. HEANY. Fibrous insulation, such as asbestos, is applied to conductors as a smooth uniform sheath. This is effected by covering a thread or filamentary body with a coating of the fibres, using an adhesive binder, and winding this on the conductor, and finally smoothing. Three figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** BROCKIE and JOHNSON & PHILLIPS [Contacts] 4,927/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** OTIS ELEVATOR CO. (*Otis Elevator Co.*) [A.C. motor control] 3,249/13; B.T.-H. CO. (*G.E. Co., U.S.A.*) [Insulation] 3,271/13 and 3,566/13; [Motor control] 3,565/13; LEE and OLDFIELD [Vehicle lighting] 7,286/13; WIDEGREN [Duplex working of apparatus at a distance by pulsating current obtained from direct] 29,240/13.

**Dynamoes, Motors, and Transformers:** LJUNGSTRÖM and WIDSTRÖM [Commutator machines] 4,773/13; BROOKS & HOLT, 15,697/13; RICHARDSON [A.C. rectifiers] 19,668/13.

**Ignition:** BIDDLECOMBE and THOMAS, 28,513/12.

**Instruments and Meters:** GARSIDE [Prepayment] 7,853/13; HARTMANN & BRAUN A.-G. [Multiple recording] 27,348/13.

**Switchgear, Fuses and Fittings:** BURSTYN [Suppression of the

arc at break] 3,882/13; COOPER and BARLOW [Lift and crane controller] 4,869/13; GROVES [Magazine fuse-box] 6,861/13.

**Telephony and Telegraphy:** WILLIAMS [Cable signalling] 788/13; MARCONI [A.C. production] 802/13; AUTO. TELEPHONE MFG. CO. (*Auto. Elec. Co., U.S.A.*) [Telephony] 3,339/13; GRUBB and BOUVERIE [Communication between moving stations] 3,766/13; STERLING TELEPHONE & ELEC. CO. and BELL [Intercommunication telephony] 4,396/13; GELL [Automatic telegraph apparatus] 14,407/13; SCHIESSLER [Telephone relays] 15,179/13; REEVES and LUNDELL [Automatic telephone exchanges] 15,579/13.

**Traction:** ALEXANDER (*Union Switch & Signal Co.*) [Governing speed of trains] 8,245/13; WALLACE and MACEY [Trolley collectors] 20,284/13.

**Miscellaneous:** HARDY [Automatically opening gates] 6,289/13; BARRON and HUDSON [Closing railway carriage doors from guard's van or engine] 8,611/13; MASCH. A.-G. BALCKE [Air filters] 13,353/13; DAVIS [Submarine lamps] 21,115/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Arc Lamps:** DEUTSCHE GASGLÜHLICHT A.-G. (*AUERGES*) [Metal vapour] 15,046/13; SIEMENS SCHUCKERTWERKE GES., 23,188/13.

**Dynamoes, Motors and Transformers:** SCHERBIUS [Current transformation] 2,822/14; [Arrangement of valves] 3,169/14.

**Electrometallurgy:** LESCURE [A.C. furnace for treating molten metals] 3,291/14.

**Switchgear, Fuses and Fittings:** MURRAY [Cut-outs] 17,345/13; THODER & CO. [Automatic switches] 2,903/14.

**Miscellaneous:** SOC. D'ÉLECTRICITÉ MORS [Signalling] 2,741/14; O'KEENAN [Clock synchronising] 2,924/14; SOC. INTERNATIONALE DE LUMIÈRE FROIDE (PROCÉDÉS DUSSAUD) [Lighting apparatus] 3,067/14; BAUER, [Combined tail-light and signal for automobiles] 3,140/14.

The following Amended Specifications may now be obtained:—

**Incandescent Lamps:** C. D. ABEL (*Siemens & Halske A.-G.*) [Filaments] 20,277/04.

**Miscellaneous:** C. ABEL-MUSGRAVE [Radio-active emanations] 21,462/11.

### Opposition Entered to Grant of Patent

9,388/13. **Lamp Cartons.** C. H. FOYLE and BRITANNIA FOLDING BOX CO.

### Petition for Extension of Term of Patent

12,431/00. **Extraction of Liquid from Solids by Electro-Osmose.** G. B. SCHWERIN. Mr. Justice Warrington has directed that the petition of the patentee and of Elektro-Osmose A.-G. for an extension of term of this patent be heard not before June 23rd.

### Lapsed Patent Restored

5,522/07. **Electro-Magnetic Separator for Grain Conveyors, &c.** JAS. HAWLEY, LTD. and A. S. JONES. An order has been made restoring this Patent, which lapsed owing to the non-payment of the renewal fee.

### Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** T. L. CARBONE [Magnetic blow-out in form of a ring] 24,859/02.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H. CO. (*G.E. Co., U.S.A.*) [Sectionalised distributing system with automatic section protection] 24,181/04; P. MACGAHAN [Duplex conductors] 23,007/08.

**Electrochemistry and Electrometallurgy:** C. N. RÜBER [Calcium chloride and phosphates] 24,891/07.

**Ignition:** R. F. HALL [Sparking plugs] 20,507/00; W. MULHOLLAND, 24,403/08.

**Switches, Fuses and Fittings:** P. KENNEDY [Regulating switches for train-lighting equipments] 17,314/05; A. P., G. C. and P. A. LUNDBERG [Tumbler switch for starting induction motors] 24,058/08; P. L. DE JARNY [Chains for lighting fittings] 24,263/08.

**Traction:** N. C. E. FLAMAN [Recording on train position of all signals passed] 24,094/08.

**Miscellaneous:** E. HOLLINGSWORTH (*H. Wyman, Crompton and Knowles' Loom Works, U.S.A.*) [Stop motions for looms] 24,899/02; F. BRAUN [Baths] 25,187/07.

## ELECTRIC TRACTION NOTES

In addition to his Paper, "Motor and Control Equipments for Electric Locomotives," read and discussed at the Institution of Electrical Engineers last Thursday (see *ELECTRICAL ENGINEERING*, February 26th, p. 117), Mr. F. Lydall presented a short Paper entitled, "Electric Locomotives." This was supplementary to the Paper published in the *Institution Journal* last November (see *ELECTRICAL ENGINEERING*, November 13th, 1913, p. 633). Four or five new designs were described. We illustrate the latest locomotive for the Loetschberg Tunnel Railway. It now appeared, said the author, that, for high- or low-pressure D.C. locomotives for shunting or freight work at speeds customary in this country, the articulated bogie principle, with four geared motors suspended on the bogies in the ordinary way, was the best. For A.C. railways the choice of drive was more open. There was a tendency towards concentrating the motive power in one or two motors, and this necessitated the use of connecting

rods on one system or another. The Siemens locomotives of the 1-C-1 type (i.e., one pair of leading wheels, three pairs of driving wheels, and one pair of trailing wheels) for the Wiesenthal Railway had been found to give trouble due to mechanical resonance at a speed of about 36 km. per hour. Some alterations had been made, and the trouble overcome. The two motors still drove the jack-shaft, which was between two of the three pairs of driving wheels, by side connecting rods. Similar vibratory effects had also been noticed on many other railways where coupling-rod systems were used, and these effects were especially noticeable in those cases where a pair of motors was coupled to a single jack-shaft, or where a pair of motors was rigidly coupled together by any arrangement of connecting rods. There was at present a tendency on the Continent, and, the author believed, in the United States, towards the use of gearing rather than connecting rods for transmitting the torque to the jack-shaft, or direct to the driving axles.

In the course of his remarks Mr. Roger T. Smith (Chief Electrical Engineer, G.W. Rly.), who opened the discussion, said that electric locomotives would supplant steam locomotives in this country, not so much on the question of economy as because they could do what the steam locomotives could not. For instance, in taking mineral trains from the "hinterland" to the coast the electric locomotive, for running at 35 m.p.h., was the lighter, and could haul a complete load of empty trucks up the gradients met with, whereas two steam locomotives were required for this work. With regard to acceleration, in the A.C. system every notch on the controller was a running notch, and so the difficulty of the slipping of the wheels, which might arise on D.C. locomotives, was not present, as the driver could wait on any notch for the conditions to change. Mr. F. W. Carter (B.T.H. Co., Rugby) did not think that the Paper was critical enough of the different types. He pointed out that weight at the end of a locomotive was conducive to nosing and allied defects. Side rods, he said, were the cause of a great deal of trouble, and jackshafts were worse. Mr. J. Bowden (Met. Rly., Neasden) favoured the use of side rods. He asked the author several questions. Mr. J. B. Sparks showed some slides on behalf of Mr. Theodore Stevens, and pointed out that D.C. motors could be built for pressures up to 1,200 or even 2,400 volts or more, against 300 volts for single phase. Thus the current handled would be greatly reduced, although the number of contactors required was greater. The cost of D.C. locomotives appeared to be only about half that of single-phase locomotives. Dr. S. P. Smith (City and Guilds Engineering College) said that for equal outputs high pressure D.C. and ordinary single-phase motors were about equal in weight. The author replied briefly to some of the points raised. He pointed out that as the conditions varied so much, the cost of A.C. and D.C. locomotives varied from £35 to £120 per ton.

Reference was made to the electrification scheme at the annual meeting of the London & South Western Railway Co. last week. The work on the first three sections of the line, viz., from Waterloo to Kingston, Twickenham and Richmond, and back to Waterloo; the Hounslow loop and the Wimbledon

line via Southfields, is being pressed forward, and it is hoped that one of them will be ready for the running of electric trains before the end of this year. The Chairman also stated that the whole of the contracts in connection with this work have been placed with British firms.

At the annual meeting of the London, Brighton & South Coast Railway Co., it was stated that the section from Balham, through Streatham Common, Norbury, Thornton Heath, Selhurst, West Croydon, to Wallington, will be converted to electric traction at the end of this year. The whole of the conversion of the suburban lines is expected to be completed within four years. Since the establishment of electric trains four years ago, the Company has carried, on an average, over 6,000,000 passengers in excess of the last twelve months' period of steam working.

The Board of the Metropolitan Railway Co. has had a very difficult task to secure the consent of the shareholders to its Bill now before Parliament, which provides for the creation of a joint committee of the Great Northern and the Metropolitan Railway Companies to work the Great Northern & City Railway, acquired by the Metropolitan Co. last year. One shareholder has been very insistent in his objections, and has demanded poll after poll at the various meetings. The Board, however, has been able to defeat the opposition; but it is now suggested that, inasmuch as the Great Northern & City shareholders' votes have been responsible for this defeat—which the Board denies—the opposition is intending to deposit a petition against the Bill in Parliament.

A report has been prepared relating to the street traffic of Montreal, and a recommendation is made to build subways or tube railways at a cost of some £4,000,000, and new surface tramways at a cost of £2,500,000.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Three Marconi stations have been opened in Spain. These are situated at Finisterre, Santander, and Cape Palos, about sixteen miles from Cartagena. The first of these is to be connected by land-line with Corunna.

In reply to a question in the House of Commons on Monday by Mr. W. Guinness, Captain Norton stated that work on the English base station of the Imperial Wireless chain had already been commenced at Leafeld, Oxfordshire, but the full details of the plant had not been settled. The Egyptian station, for which a site has been purchased about fifteen miles from Cairo, was to be a three-way station, as a suitable site in East Africa for the three-way station originally proposed could not be found. The Marconi Co. were willing to guarantee continuous communication between Egypt and India. The third station would thus be in India in the neighbourhood of Poona. The East African station was, however, still necessary as a link with South Africa, but neither it nor the South African station could be proceeded with until the agreement was ratified by the South African Government. The sites have, however, been provisionally selected. In reply to another question from Mr. Guinness, Captain Norton, referring to the acquisition of the Goldschmidt system by the Marconi Co., said that Lord Parker's Committee had reported that the system was a promising one, and the Postmaster-General would consider its adoption for the later stations of the Imperial chain if proof were forthcoming that it was more efficient or more economical than the Marconi system.

A Local Government Board inquiry was held last week concerning a loan of £192,423 for the purchase of the Post Office Hull telephone system by the Hull Corporation. There was a certain amount of opposition to the proposal, but a large amount of support.

The Mossoul-Bagdad and Alep-Bagdad lines were down on the 25th ult. and repaired on the same day.—The Oran-Tangier communication failed on the 26th ult., and on the 27th the Persian lines between Borazjoon and Behbahan-Ahvaz-Mohammareh-Shushter were restored.—The Amazon Telegraph Co. now accepts deferred messages at half rates on its system, and censorship on telegrams for the Union of South Africa has been cancelled.—A severe blizzard in New York has laid low practically all telegraph and telephone lines, but at the time of going to press conditions were practically normal.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 139. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**GEARING.**—An interesting pamphlet on the advantages of tool steel gears and pinions, including some remarkable examples of their wearing qualities, has been sent us by Scholey & Co., Ltd. (151 Queen Victoria Street, E.C.).

**HEATING AND COOKING.**—Reductions have been made in the prices of some of the "B. & K. Universal" heating apparatus placed on the market about 18 months ago. We are informed by the Brompton & Kensington Accessories Co., Ltd. (254-260 Earl's Court Road, Kensington, S.W.), that, if desired, samples will be sent on "sale or return." The range of articles listed includes toasters, water heaters, boiling rings, tea and coffee pots, chafing dishes, irons, &c.

**SILICA MERCURY VAPOUR LAMPS FOR THE LABORATORY.**—The most recent adaptation of the mercury vapour lamp as an economical source of ultra-violet light adapted for experimental laboratory work for scientific and industrial purposes is described in a new leaflet issued by the Westinghouse, Cooper, Hewitt Co., Ltd. (80 York Road, King's Cross, N.).

**INSULATORS.**—A list of "Viaco" insulators has just been issued by the Electrical Engineering & Equipment Co., Ltd. (109-111 New Oxford Street, W.C.). The insulators are made of a special moulded material, and tests are quoted to show that they possess great advantages over porcelain for telegraph and telephone lines.

**"E.C." JOURNAL.**—In addition to the permanent features of the "E.C." Journal, which is published monthly by the Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.), No. 2 contains short illustrated articles on the A.E.G. large machine shop, and its lighting by means of "Sunshine" long-burning flame arc lamps. The problem of preventing the condensation of moisture on shop windows, the time saved by the use of electrically-driven portable tools for motor-car repair work, and a new single-phase meter, are also dealt with. The permanent features referred to above embrace January quotations of copper, tin, rubber, and lead, and a list of motors in the London stock at the present time.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**LAMPS.**—A very cleverly contrived folder from the Edison & Swan United Electric Light Co., Ltd. (Ponder's End, Middlesex), shows, through a hole in the front, a hand about to remove an old lamp from a pendant. When the page is turned over the hand withdraws the lamp, to replace it by a Royal Ediswan in the most lifelike way.

Another new folder from the Edison & Swan United Electric Light Co. depicts a drawing-room in which a number of couples are dancing by the light of Royal Ediswan lamps.

**ELECTRIC FIRES.**—Belling & Co. (Lancaster Works, Derby Road, Edmonton, N.) have produced a most effective poster advertising their well-known fires. A lady is seen in bed turning on an electric fire, and a splendid effect of warm glow is obtained by the bold colouring in conjunction with the black background.

**HEATING AND COOKING.**—A new list has been issued by Credenda Conduits Co., Ltd. (Chester Street, Aston, Birmingham), in which the "Credenda" system of heating and cooking apparatus is described. Nickel-chrome ribbon is wound on a mica former for use on apparatus where regulation is required or where strip system is specified. What is known as the "Disc" element consists of an enamelled steel disc, into which is fixed by means of a fireproof cement the insulated nickel-chrome heating wire. The leading out wires pass through bushes of steatite. This element is made to cover the entire bottom of the utensil, and can be removed and replaced very rapidly, if required. The list prices many artistic designs of kettles, various saucepans, warming and boiling plates and grills, as well as a range of ovens, irons, lamp radiators, and convectors. In the case of the irons the construction of the element permits of the heat being applied right up to the toe, and in those cases where regulation is required this is obtained by means of three fire terminals and plugs. The London agents for this apparatus are Baxter & Caunter, Ltd. (219 Tottenham Court Road).

HALF-WATT LAMP FITTING  
WITH ALBA GLASS BOWL.

### SEMI-INDIRECT LIGHTING BY HALF-WATT LAMPS

LAST week we illustrated some designs of semi-indirect lighting fittings for half-watt lamps, which have been put on the market by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.). We now illustrate another, in which the principal feature is an ornamental "Alba" bowl. The half-watt lamp, with its high intrinsic brilliance, should not be used for interior lighting without the light being adequately diffused, and this particular style of glassware is admirably adapted to the purpose.

### SMALL ELECTRICALLY DRIVEN TOOLS

WE have received from Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), a catalogue giving particulars of the range of electric drilling machines and motor grinders, which they are placing on the market. These include portable drilling machines, single- and three-speed, in six sizes, from one-sixteenth h.p. to 1 h.p., for both continuous and alternating current (single- and two- and three-phase), with a complete set of accessories and spare parts; bench drilling machines, single- and three-speed, one-sixteenth to one-third h.p.; pillar drilling machines from one-quarter h.p. to one-twelfth h.p., and lathe- and hand-operated grinding motors. The motors are fitted with ball-bearings throughout, and the weight of the portable types has been kept as low as is possible without serious loss of efficiency and overload capacity. All the drills are suitable for woodworkers as well, and the size of holes in wood may be taken as roughly double that in iron. We understand that the motors are of particularly ample rating in order to withstand the rough usage met with in ordinary working. They are totally enclosed, and the electrical parts are separated from the gearing, so that no grease can percolate into the commutator or windings. All the gear wheels run in grease, by which means friction and noise are reduced to a minimum. For A.C. circuits, induction motors only are used. The self-contained bench drill illustrated here drills up to  $\frac{3}{8}$  in. and is fitted with a  $\frac{1}{4}$ -h.p. motor.

ELECTRIC BENCH DRILL.

**Mazda Daylight Lamps.**—In last week's ELECTRICAL ENGINEERING, page 112, reference was made to some remarks by Prof. Silvanus Thompson at a meeting of the Illuminating Engineering Society on incandescent lamps with specially coloured bulbs giving a light very closely resembling daylight, by which colours of pictures, &c., can be seen in their true proportions. The British Thomson-Houston Co. inform us that the lamps shown on the occasion in question were standard Mazda lamps coated with a special daylight varnish supplied by them. These dipped lamps are supplied at a very slight increase in price, and can be applied to any existing picture lighting fittings.

# OSRAM

## LAMPS

### Important Notice

## JUDGMENT

THE OSRAM LAMP WORKS, LTD., beg to inform the Trade and the Public that on January 26th, 1914, in the High Court of Justice, Chancery Division, Mr. Justice Warrington GRANTED AN INJUNCTION against THE ELECTRIC FITTINGS SUPPLY CO., 169 Highbury New Park, N., and 1 Melson Street, Luton (Proprietor, MORRIS LEWIS), in default of defence, in the action instituted by the Osram Lamp Works, Ltd., for infringement of OSRAM Patents Nos. 23899\* of 1904 and 18622 of 1906 (the validity of which had already been certified by the Court).

The infringement complained of in such action was the sale of

### "VOLT" LAMPS

manufactured by the Metallic Glowlampworks "Volt" Ltd.,

Tilburg, Holland.

It was FURTHER ORDERED that the Defendants deliver up to the OSRAM LAMP WORKS, LTD., or destroy in the Presence of their representatives, all such infringing lamps in their Possession, and that an inquiry be held to ascertain what damages had been sustained by such infringement, and that the Defendants Pay THE OSRAM LAMP WORKS, LTD., their full Costs, Charges, and Expenses in the Action as between Solicitor and Client.

**WARNING!** Dealers in and users of similar infringing lamps will be proceeded against.

### "ULTRALUX" GLASSWARE

THE Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), has recently placed on the market Ediswan "Ultralux," a new scientific glassware for electric light fittings. It is pure white, uniform in thickness, and embodies the latest ideas of scientific construction, coupled with an elegant appearance, so that it can be used

CONCENTRATING TYPE  
EDISWAN "ULTRALUX"  
GLASSWARE.

DISTRIBUTING TYPE  
EDISWAN "ULTRALUX"  
GLASSWARE.

for fancy or plain decorative work. A special feature is that a standard  $1\frac{1}{2}$ -in. hole is provided, so that galleries can be dispensed with. Ediswan "Ultralux" is made in two types, concentrating or intensive, as shown in the illustrations. A leaflet dealing exclusively with this glassware has been issued by the Company, and should be in the hands of every electrician interested.

### HALF-WATT LAMP FITTINGS

SEVERAL new fittings for Wotan half-watt lamps have been introduced by Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston). One of these, which is illustrated here, enables "Wotan" half-watt lamps to be adapted for indirect lighting, and in this case a deep opal bowl is used.

OPAL BOWL FITTING FOR  
HALF-WATT LAMPS.

The indirect lighting system has been to some extent handicapped owing to the loss of efficiency through the absorption of light by the reflecting surfaces. As half-watt lamps make it possible to double the candle-power of the lighting unit, indirect lighting schemes can be arranged at a reduced cost

and far more successfully than hitherto. This fitting can be arranged for 1,000- and 2,000-c.p. "Wotan" half-watt lamps in bowls 14 in. and 16 in. in diameter respectively.

Another fitting is made up for use with Holophane reflector bowls, and is especially suitable for the lighting of large halls, stores, and high-class business establishments.

A price-list will shortly be issued embodying these designs.

### A COMPREHENSIVE CATALOGUE

AN octavo bound catalogue of over 950 pages has been issued by the Electrical Co., 122-4 Charing Cross Road, W.C. Although this covers an immense range of electrical plant and apparatus, it does not pretend to be complete, and the Company say, in the preface, that to include all the goods they supply, a book nearly ten times the size would be required. Each section, however, is thoroughly representative of the class of articles that can be conveniently purchased without special quotations. The introduction gives some interesting views on the particulars of the works where the various products are manufactured, and gives a good idea of the magnitude of the Company's operations. The utility of the volume is also enhanced by the inclusion of the text of the Home Office factory and mining regulations, and a list of voltages of British supply undertakings. The successive portions of the catalogue deal with machines, control gear, high-tension and other switches, fuses and protective apparatus, and switchgear generally, installation material, fans, small motors and their applications, instruments, arc lamps, electric irons, and domestic and other heating and cooking apparatus, meters, electric clocks, cables, incandescent lamps, signs, and illuminating material. A great deal of useful information is included in every section, and the whole list is well arranged, well printed, and conveniently indexed.

### THE NEON LAMP

THE Neon lamp, as developed for advertising purposes, has just been put on the market in this country by the Westinghouse Cooper Hewitt Co., Ltd. (80 York Road, King's Cross, N.). A high-pressure alternating or pulsating current is necessary to work these lamps, but they are said to last about 1,200 hours, and are economical to run and simple to control. The Neon lamp consists of a lead glass tube with pure copper electrodes, sealed in by means of platinum, and evacuated by means of a mercury pump, and finally by means of charcoal cooled with liquid air. This also has the effect of removing impurities from the electrodes. Without this treatment the lamp is not successful. A trace of neon gas, the residue obtained by the fractional distillation of liquid air, is then introduced into the tube, and this sealed off. The light emitted contains no blue waves, but is a rich red, entirely different in colour from any other illuminant, and this is very attractive for signs. Existing signs may be illuminated by straight lengths of tube, or the sign wording may be traced by the tube itself. Straight tubes are usually 50 mm. (about 2 in.) in diameter and 6 metres (19.7 ft.) long, but shorter lengths can be supplied. The luminous intensity is said to be approximately 200 spherical c.p. per metre. The tubes for lettered signs are about 15 mm. (0.6 in.) diameter. As stated above, the lamp requires alternating or pulsating current. On A.C. circuits the pressure is stepped up by means of a small transformer, in the primary circuit of which is a regulating inductance and D.P. switches and fuses. For D.C. circuits a small motor-generator set, rotary-converter, or induction coil must be provided. In the case of the 50-mm. diameter tube 6 metres long, a current of 1 ampere passes, with a pressure of about 1,000 volts, across the electrodes. Each additional metre length requires about 100 volts extra. The lamps last about 1,200 hours without attention, but then require re-evacuating, as the neon appears to be absorbed by the electrodes and the glass. They light up as soon as the switch is closed. It is found that, by introducing a minute quantity of a mercury salt into a neon tube, an enhanced effect may be obtained, as the neon gas gets compressed into a band, which continually travels along the tube from end to end, and the characteristic colours of the neon and mercury vapour are produced in the same tube. These Neon lamps have been used in Paris for some little time, and one is now running outside the West End Cinema, Coventry Street, London. W.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Blackpool.**—An application is to be made for sanction to borrow £15,000 for cable extensions.

**Brighton.**—The Borough Electrical Engineer reports that the following loans will be necessary in order to meet future expenditure:—Distribution mains, £5,000; services, £4,250; motors for hire, £3,000; heating and cooking apparatus, £2,500.

**Cambridge.**—The University Buildings Syndicate is seeking authorisation to spend £3,000 upon a power station in the Engineering Laboratory.

**Colwyn Bay.**—A proposal to build a new generating station estimated to cost £21,000 is to come before the Council shortly.

**Heston and Isleworth.**—Twelve months' supply of cable, meters, &c. Borough Electrical Engineer. March 7th.

**Manchester.**—Tramway rail bonds, trolley-wire and span-wire brackets. General Manager. March 17th.

**New Zealand.**—The Dunedin Corporation anticipates a considerable expenditure upon its electric supply undertaking.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Bradford.**—New infirmary (£200,000).

**Cleethorpes.**—New public hall adjoining Town Hall.

**Leicester.**—Extensions to sanatorium. Clerk, County Council, 10 New Street.

**London: L.C.C.**—Two hundred lights at Upper Marylebone Street School, Great Portland Street, W. (See an advertisement on another page.)

**Southampton.**—New library at Portswood.

**Wellingborough.**—Technical institute, Midland Road.

### Miscellaneous

**Blackpool.**—Six open-type bogie cars. General Manager. March 25th.

**Deane Valley.**—The Light Railway Commissioners have been holding an inquiry into the joint light railway scheme of the Urban District Councils of Wombwell, Wath-on-Deane, Bolton-on-Deane, and Thurnscoe. There is considerable opposition to it on the part of the railway companies and others. The proposed scheme has excited considerable interest in the district owing to the development of the South Yorkshire coalfield, and the difficulty which miners experience in getting to their work.

**Netherlands.**—The name and address of a company which proposes to build a factory for the manufacture of electric cables is on file at 73 Basinghall Street, E.C.

## TENDERS RECEIVED AND ACCEPTED

**Accrington.**—The following tenders have been accepted:—Two 1,000-h.p. gas engines, National Gas Engine Co., £10,750; alternator and dynamo, Bruce Peebles & Co., £2,550; gas-making plant, the Power Gas Corporation, £11,000; three single-deck tramcars, Brush Electrical Engineering Co., £2,832; double-deck tramcars, £2,092.

**Ipswich.**—An order has been placed with H. W. Butler & Co., Craven House, Kingsway, the London Agents of the A.C.E.N.E. Cable Works, Jeumont, France, for high- and low-tension cable extensions.

**London: L.C.C.**—Tenders were invited from forty-six firms manufacturing metal filament lamps other than drawn-wire filaments, and that of Pope's Electric Lamp Co. is recommended for acceptance under items 8 to 27 of Schedule No. 17. The lowest tender was for lamps of foreign make, which was not satisfactory, and the next lowest tender, that of the Electric Lamp Supply Co., was also for lamps of foreign

make. The lowest British tender was that of the Pope Co., whose prices are about 11 per cent. above those of the Electric Lamp Supply Co.'s tender.

## APPOINTMENTS AND PERSONAL NOTES

A switchboard attendant is required in the Stoke-on-Trent Electricity Department. (See advertisement on another page.)

Mr. H. Wood, of Doncaster, has been appointed Engineering Draughtsman in the Stoke-on-Trent Corporation Electrical Department, at a salary of £104, rising to £130 per annum.

The Colne Council will shortly be advertising for a Tramway Manager at a commencing salary of £225 per annum.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £66 10s. to £67. (Last week, £67 to £67 10s.)

**Bankruptcy.**—F. I. Behrens, trading as Fred Burns, Electrical Engineer, 16 Market Street, Barnsley, has been adjudicated bankrupt. A first meeting of creditors will be held at the County Court Hall, Regent Street, Barnsley, on March 9th, at 10.30 a.m., and the public examination at the same place on March 26th, at 10.30 a.m.

**Change of Address.**—R. Belfield, Ltd. (3 London Wall Buildings, London Wall, E.C.), inform us that they are moving into more suitable offices on March 16th, at 65 Victoria Street, S.W.

**Dissolution of Partnership.**—V. J. Harraway and A. J. Cunningham, carrying on business at 146 High Street, Kensington, and 45 King's Road, Chelsea, as Harraway Bros., Electrical Engineers, have dissolved partnership, on the formation of a limited company to carry on the business.

**New Branch.**—Galsworthy, Ltd. (15 and 16 Newman Street, W.), are opening a branch in Leeds, with showrooms, at Athenian Buildings, 9 Park Lane. Mr. W. B. Clifton will take over the management of the Leeds branch, and they have appointed Mr. Wm. A. Maddick to represent them in London and on the South Coast.

**Liquidations.**—The Electromotor Equipment Co., 59-65 Paul Street, London, is to be wound up voluntarily. The liquidator is Mr. O. Steiner, 21 Old Broad Street, E.C. A meeting of creditors will be held at the above address tomorrow, March 6th, at 2.30 p.m.

**New Telephone Number.**—The Record Electrical Co. (Caxton House, Westminster, S.W.) have now an additional telephone line, and their numbers are Victoria 6700 and 6701.

**Osram Lamp Patents.**—On Friday last Mr. Justice Eve had before him a summons by Osram Lamp Works, Ltd., against the Gabriel Lamp Co. for an injunction to restrain alleged infringement of Osram metal filament lamp patents. An order had been previously made for the Gabriel Lamp Co. to answer certain interrogatories, but they refused to answer two of these, which asked whether the lamps sold by the Gabriel Co. were supplied by the Campagne Générale d'Electricité of Paris. Mr. Justice Eve decided that the information desired was not a proper subject for interrogatories.

It is announced that Osram Lamp Works, Ltd., has obtained an injunction against the Electric Fittings Supply Co. for infringement of patents Nos. 23,899 of 1904 and 18,622 of 1906. The infringing metal filament lamps were "Volt" lamps, made by Metallic Glowlampworks "Volt," Ltd., of Tilburg, Holland.

## LOCAL NOTES

**Bingley: Electricity Supply.**—The new sub-station, which is supplied by the Keighley Corporation, and from which electricity is distributed in detail by the Council, has now been put into operation. The total cost of the scheme has been about £7,000.

**Edinburgh: Street Lighting.**—Notice of motion has been given by Bailie Stevenson, the Convener of the Electric Lighting Committee, recommending that the Cleaning and Lighting Committee should report as to the lighting of the whole of the streets in the City with electricity.

**Elgin: Electric Lighting.**—The question of introducing electric supply in the district has been referred to the Council in committee.

**Japan.**—A company is said to be in course of formation at Fukushima for developing certain water powers with a capital of about £51,000. The name and address of the new company is on file at 73 Basinghall Street, E.C.

**Limerick: Electric Lighting Undertaking.**—For the first time for several years the accounts of the electricity undertaking show a profit. The loss per annum has hitherto averaged £1,600.

**Manchester: Electricity and Gas Management.**—In his address to the Manchester District Institution of Gas Engineers last week, Mr. J. G. Newbigging, Chief Engineer to the Manchester Corporation Gas Department, advocated the single management of municipal electricity and gas undertakings as being in the best interests of the ratepayers. This matter, of course, has some reference to the feeling which exists in some parts of the country that electricity and gas undertakings should not compete in the matters of price.

**Southport: Electricity Tariffs.**—There has been considerable controversy recently as to a rearrangement of the Electricity Department's tariffs, but an endeavour by the Committee to frame a tariff which would help to develop the use of electricity in small houses has been defeated after a two hours' debate at a special meeting of the Corporation. The proposed charge for cottage property was 7s. 6d. per lamp for installation, with a minimum of three lamps, and 1½d. per lamp per week for current if paid a month in advance, and 2d. per week if paid a week in advance. All lamp renewals to be paid for by the consumer. For larger houses the charge proposed was 10s. per lamp for installation, with a standing charge of £2 10s. to £11 10s., according to the size of the house, plus ½d. per unit for all current used.

**Stoke-on-Trent: Street Lighting.**—An experiment is being made in Liverpool Road with some 600-c.p. half-watt lamps.

**Torpoint: Electric Lighting.**—A poll of ratepayers has been taken as to the method of lighting for the next five years. Out of 1,150 electors, only 425 voted, and the result shows a majority of 55 for electricity.

## NEW COMPANIES

**MIDLAND ELECTRIC ROTARY BLOWING CO.,** Traffic Street, Derby. Capital, £1,000. Electric organ-blower makers. **LIGHTING SUPPLIES,** 36 Commercial Road, E. Capital £2,000. Chairman, H. A. Jacoby.

**Lantern Slides.**—In view of the large number of demands made for sets of lantern slides to illustrate lectures on electrical subjects, the General Electric Co. have prepared a series of slides which represent the latest practice in electrical work, and which it is believed will prove a source of considerable interest to scientific and engineering societies. In order to add to the interests of the slides, a description of each has been prepared, and accompanies the slides, which the General Electric Co. will loan with pleasure to any responsible engineer. Application should be made to the Advertising Dept., 67 Queen Victoria Street, London, E.C.

**Henley's Cables.**—W. T. Henley's Telegraph Works, Co., Ltd., send us a folder, intimating that purchasers of their "Association" and "Non-Association" cables and wire can distinguish these products by stripping the tape round the core. The firm's name and an indication of the class of cable appears in every case on the back of the tape.

**"Mazda House News."**—The current number of the bright journal conducted by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), is a special half-watt lamp issue, and a great deal of information regarding the Mazda half-watt lamp is given. Numerous designs of fittings for use with these lamps are illustrated.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &amp;c.

**Bastian Meter Co.**—There was a slight decrease in the net trading profits last year compared with the previous twelve months. A 2½ per cent. dividend is recommended on the ordinary shares.

**Hove Electric Lighting Co.**—The annual report states that the Hove Corporation has notified the Company that the agreed purchase price of the undertaking, viz., £175,500, will be paid in three or four weeks' time. The result of the past year's working shows a reduction in net revenue of £601, but a dividend, making a total of 9 per cent. for the year, is declared on the ordinary shares, leaving a surplus of £8,365.

**Fife Tramway, Light & Power Co.**—It is proposed to increase the company's capital by an additional 50,000 preference shares and a similar number of ordinary shares. The company's business has considerably increased during the past twelve months, and a dividend of 3½ per cent. is declared upon the ordinary shares.

**North-East Coast Power Companies.**—A scheme has been devised for a closer union of the interests of the County of Durham Electrical Power Distribution Co. and the Newcastle Electric Supply Co. The arrangement is that the latter Company should acquire the outstanding shares in the Durham Company.

**Premier Electric Control.**—The capital has been reduced, by order of the High Courts, from £10,000 to £4,125.

**Waste Heat and Gas Electrical Generating Stations.**—The report and accounts given in our last issue were adopted at the meeting on Friday. The Chairman mentioned that proposals are now under consideration for the erection of one or two more generating stations, and it is hoped to get the works well in hand during the current year.

**Accounts of London Supply Companies.**—With few exceptions, all the London electric supply companies have now issued their accounts for 1913, and not the least interesting feature of them is the large amounts which stand to the credit of reserve funds. For instance, the City of London Co. is proposing to carry forward £27,836, making the reserves total £240,251. A final dividend making 10 per cent. per annum on the ordinary shares is recommended against 9 per cent. for the previous twelve months. In the case of the Metropolitan Electric Supply Co. there is a sum of £319,355 standing to the credit of depreciation and reserve fund, including £22,000 set aside from the past year's accounts. A final dividend, making 4½ per cent. for the year compared with 4 per cent. in the previous year, is recommended. The Chelsea Electricity Supply Co. recommends a final dividend, making 5 per cent. for the year, the same as in 1912. The Charing Cross Company's dividend is 6 per cent. compared with 5 per cent., the Notting Hill Co. 5s. per share, as in 1912, and the South Metropolitan Electric Light and Power Co., while not declaring a dividend on the ordinary shares owing to the provisions of a debenture trust deed, has transferred £10,000 to reserve, and £5,000 to depreciation account. The County of London Co. makes a 7 per cent. distribution for the year, compared with 6 per cent. last year, at the same time carrying £33,000 to reserve, depreciation, and renewals. The Brompton & Kensington Co. recommends a final dividend, making 10 per cent. for the year.

**North Metropolitan Power Supply Co.**—The proposal to raise £100,000 new preference stock has been sanctioned by the shareholders.

**British Insulated & Helsby Cables.**—A 13 per cent. dividend is recommended upon the ordinary shares, compared with 10 per cent. in 1912.

## What the Public Wants

Booklets describing in simple language the various applications of electricity.

Part I. "Electric Lighting" (Price 1d., by post 2d.).

Part II. "Electric Cooking and Heating, and other Domestic Uses of Electricity" (Price 2d., by post 3d.).

Part III. "Works Driving" (Price 2d., by post 3d.).

Prices for quantities on application to the

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

A NEW set of working rules for the London District has been issued by the London Electrical Masters' Association. An increase of wages from 9d. to 10d. per hour is granted from April 1st, with a further increase to 10½d. from July, but for "pipe-fitters" the wages are to remain at 9d. Whether the Electrical Trades Union, which demanded a minimum of 11d. and no grading of workmen, will take any action in the matter, will probably be decided at a meeting to-night. (Page 142.)

THE principal features of the Lloyd electric vehicles for commercial purposes are described in an illustrated article which contains particulars of a 5-cwt. lorry, a 2½-ton chassis, and a tractor for drawing 3 tons, all driven by motors geared to the front wheels. (Page 143.)

THE British Thomson-Houston Co. is bringing actions for infringement of its drawn tungsten filament patent No. 21,513/06 against several firms. We give the claims in the patent specification in question.—The Law Officer, on appeal, has allowed the grant of patent No. 5,026/12, in spite of the opposition, but he has upheld the Comptroller's decision not to grant on applications 5,027/12 and 5,028/12. These patents were applied for by J. Hubers on behalf of Julius Pintsch A.-G. (Page 144.)

THE report of Mr. A. P. Trotter's recent Paper on medium- and low-pressure overhead line construction is concluded. A simple triangular guard, which may be applied to the lines in various ways, has been sug-

gested by the cradle used by the Clyde Valley Electrical Power Co. The latest B.O.T. regulations for low-pressure overhead lines provide that the earth wire forming the neutral of the three-wire system, or the fourth wire of a three-phase four-wire may be used as a guard wire. Two guard wires are necessary, but they need not both be neutral conductors. (Page 145.)

A PAPER by Mr. W. G. Stokes, read at a meeting of the Manchester Branch of the Association of Electrical Station Engineers, dealt with the electrical driving of cotton mills. (Page 146.)

THE Electric Vehicle Committee of the I.M.E.A. have agreed upon the standardisation of a charging plug. (Page 146.)

At the annual meeting of the Metropolitan Electric Supply Co. on Tuesday, the Chairman referred to the London Electric Supply Bill as an attempt to "jockey" the companies, but he thought that the measure would in all probability be dropped owing to the opposition to it. (Page 146.)

THE rating of pipe-ventilated motors is discussed in our Questions and Answers columns. (Page 147.)

A SCHEME of multiple-unit train control on the Ward-Leonard system, which has showed a 20 per cent. energy consumption over the ordinary methods of control during trials on the Metropolitan Railway of Paris, is described.—The Liverpool Corporation Tramways are contributing £100,000 in aid of the rates.—The Bill for the proposed tube railway under the Tyne has been dropped. (Page 148.)

WE regret to have to announce the death of Mr. John Gott, Consulting Electrician to the Commercial Cable Co.—The reorganisation scheme of the British wireless coast stations is fairly well advanced.—The Committee for Radiotelegraphic Investigation of the British Association asks experimenters to determine if any variations in the strength of wireless signals is noticed during the coming total eclipse of the sun. (Page 148.)

PARTICULARS relating to a number of patent opposition cases, amendments, &c., are given in our "Patent Record." A Patent by A. Wright and Reason Manufacturing Co., dealing with electrolytic mercury ampere-hour meters, expires during the week after a full life. Among the specifications published by the Patent Office last Thursday is one by A. Williams relating to submarine telephony, &c., one by G. Marconi for an arrangement whereby high-frequency currents suitable for wireless are produced, and one by B. Ljungström and A. D. Widström for improving commutation. (Page 150.)

A NEW pattern of holder for half-watt lamps and a recent design of electric drill are illustrated in our Trade Section, which also contains an article on thermal circuit-breakers. (Pages 151 and 152.)

NEW plant is required at Derby (£12,540), Walsall (£5,184), Malvern, Colechester, Swindon, Carlisle, Hali-

fax (£7,000), Torquay (£5,000), Dartford.—Miscellaneous stores are required at Dundee and by the War Office; and street electric lighting schemes are under consideration at Clacton and Monmouth. (Page 153.)

THE Swansea Electricity Committee has decided against allocating electricity profits to relief of rates.—Difficulties with regard to condensing water are being encountered in connection with the proposed new power house at Manchester.—A scheme for supplying in bulk to Malvern by the Worcester Corporation is under consideration.—The Brentford Gas Co. is applying to Parliament for electric lighting powers, and also to supply power gas, and is meeting with much opposition from the electricity supply undertakings in its area. (Page 154.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MARCH 12TH.

*Institution of Electrical Engineers.*

8 p.m. "The Design of Rolling Stock for Electric Railways," by H. E. O'Brien.

SATURDAY, MARCH 14TH.

*Royal Institution.*

3 p.m. Afternoon lecture III.—"Recent Discoveries in Physical Science," by Prof. Sir J. J. Thomson, F.R.S. *Birmingham and District Electric Club.*

7 p.m. At Swan Hotel. "Electric Driving of Mills," by W. Y. Anderson.

MONDAY, MARCH 16TH.

*Institution of Electrical Engineers: Western Section.*

5.30 p.m. At University, Bristol. "The Construction of a Wireless Station," by C. G. Roach.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. At Armstrong College. Exhibition of Measuring instruments.

TUESDAY, MARCH 17TH.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal School of Technology. "Diseases of Static Transformers," by J. L. Thompson.

*Illuminating Engineering Society.*

8 p.m. At Royal Society of Arts. "A Comparison between Illumination Estimates and Performance in Practice," by W. C. Clinton.

*Institution of Civil Engineers.*

8 p.m. Papers to be further discussed:—"Rail Steels for Electric Railways," by W. Willox, and "Rail Corrugation and its Causes," by S. Sellon. Paper to be read:—"Comparative Economics of Tramways and Railless Electric Traction," by T. G. Gribble.

WEDNESDAY, MARCH 18TH.

*Electrical Trades Benevolent Institution.*

2.30 p.m. Annual General Meeting at Institution of Electrical Engineers.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. At Victoria Embankment. "Electricity in Docks and Harbours," by J. M. Heslop.

## The London Electrical Engineers.

46 Regency Street, S.W.

*Rating Exam.* for all Cos. from 7 to 10 p.m. every Wednesday. *Headquarters* open from 10 a.m. till noon every Saturday.

(TO-DAY) THURSDAY, MARCH 12TH, C. Co. FRIDAY, MARCH 13TH, D. Co. MONDAY, MARCH 16TH, A. Co. TUESDAY, MARCH 17TH, B. Co., Tech. Inst., 7 to 10 p.m. Min. Range Practice, 7 to 9 p.m.

## THREATENED WIREMEN'S STRIKE

THE following is the full text of the new working rules and conditions of employment for the London District which have just been issued by the London Electrical Masters' Association.

*Area.*—The area under which these rules shall apply is to be taken as within a radius of 12 miles from Charing Cross.

*Scope of Rules.*—These rules are not intended to apply to work on the Undertakers side of a Supply Authorities' terminals, or to employees who may be engaged for full time in a factory on manufacturing work.

### RULES.

1. *General.*—No exception shall be taken to the employment or non-employment of any workman in the electrical trade on the ground that he is or is not a member of any organised Trade Society, neither shall any exception be taken to the employment of a workman in any other trade on the ground that he is or is not a member of a Trade Society.

2. *Working Hours.*—The recognised working hours shall not exceed 53 per week.

3. *Night Shift.*—Workmen engaged on a "night shift" shall be paid one penny per hour in addition to the ordinary rate of wages, provided that workmen on a night gang shall not have been employed during the preceding day. The hours worked without overtime rates not to exceed ten per day of twenty-four hours. Double time to be paid for all time worked between Saturday midnight and Sunday midnight.

4. *Overtime.*—Overtime to commence after a day's work of ten consecutive hours (meal times excepted), and to be paid at the following rates:—Up to 8 p.m., time and a quarter; from 8 p.m. to 10 p.m., time and a half; from 10 p.m. to starting next day, double time. *Saturdays.*—From 1 p.m. to 4 p.m., time and a half; after 4 p.m., double time. *Christmas Day and Sundays,* double time. Each day to stand by itself. If the work continues after 1 a.m., and there is no ordinary means of conveyance home available, workmen shall be paid at overtime rates up to 6 o'clock next morning, unless some means of conveyance to their homes is provided by the employer.

5. *Wages.*—The following are the recognised rates of wages, and shall be observed as such:—Wiremen, on and after the first pay day in April, 1914, 10d.; do. July, 1914, 10½d. Pipe Fitter only, on and after the first pay day in April, 1914, 9d. No Pipe Fitter shall be engaged on wiring. Should wiremen be employed on pipe-fitting, their rates shall be maintained as wiremen. Improvers: After having been indentured or engaged for three years, to be paid at not less than the following rates:—Up to the end of the 4th year, 4d. per hour; 5th year, 5d.; 6th year, 6d.; 7th year, 7d. Apprentices subject to agreement with employer. At least half the hands engaged on the actual erection of electric wires, tubes, casings, or fittings shall be wiremen or pipe-fitters, or in receipt of equal rates of pay.

6. *Notice of Determining an Engagement.*—One hour's notice to be given on either side.

7. *Payment of Wages.*—Wages shall be paid on the job, but if otherwise arranged, travelling time and expenses shall be allowed to get to the pay-table.

8. *Travelling Expenses.*—Workmen who are sent from the shop to a job to any point more than two miles from the shop within the London District, shall be allowed workmen's fares daily, but no travelling time, from the shop to the job, but this rule shall not apply to men taken on at the job.

9. *Country Expenses.*—Where men are sent outside the area covered by these rules, they shall be paid at the rate of 1s. 6d. per night, but when away for less than seven days at the rate of 2s. per night, together with fares out at the commencement of the job, and home on completion. Travelling time at ordinary rates. Such men to have the option, where circumstances permit, of working two hours per day extra without overtime at ordinary rates.

10. *Wireman.*—A fully qualified wireman must be over 21 years of age, and have served an apprenticeship or have been engaged in the trade for a period of not less than seven years.

11. *Improvers or Assistant Wiremen.*—Shall either have been indentured for a term of not less than three years, or have been continuously engaged by a responsible firm or firms for a similar period in learning the trade of wireman, but have not the qualifications mentioned in the definition of a wireman.

12. *Apprentices.*—All apprentices shall be properly indentured for a term of not less than three years.

As is seen from the above, the London Wiring Contractors have decided on the conditions and rates of pay they are willing to grant, and they will come into force almost at once. There will be a meeting of the Electrical Trades Union to-night to consider these rules, and we are informed that a ballot will be taken. Objection "on principle" is taken by the Union leaders to the first rule. The London District Secretary of the Union also objects to classification of pipe-fitters, holding that the running of conduits and casings is the work of a wireman, and should be paid for at full rate. He also informs us that he considers the rule relating to improvers "is not satisfactory in all its bearings."

There can be no doubt that the above rules may be taken as the carefully considered decision of a body representing a very large proportion of the wiring contractors in London, and representing, in fact, practically all the contractors who employ Trade Union workmen; they grant a good increase of pay to wiremen, viz., a rise next month from a minimum of 9d. an hour to a minimum of 10d., and a further increase in July to 10½d. The men would certainly be ill-advised if they vote for a strike, for the employers have made a good offer, and evidently intend to stand firm; the wages and conditions of employment are so good that, even if a strike were declared by the Union, there would be many workmen, Union as well as non-Union, who would refuse to throw up their jobs.

The Committee of the Masters' Association, we understand, will consider a proposal that they should meet a deputation from the Electrical Trades Union with regard to the rules, and if this is decided upon the meeting will probably take place on Thursday next.

## LLOYD ELECTRIC COMMERCIAL VEHICLES

THE Lloyd electric vehicle is the result of considerable experience on the Continent, where, until lately, there has been a readier market for battery-driven cars than in this country; but with the attention that is now being given to the subject here the conditions are becoming much more favourable to their adoption, and the opportunity is being taken by Messrs. Mossay & Co., Ltd., to commence a career for this vehicle in England. Through the kindness of the directors of this firm, we were able recently to inspect some examples of commercial types of Lloyd electric automobiles at their premises at 45 Horseferry Road, Westminster. The principal feature of the system employed is the use of separate motors, one to drive each of the front wheels through single reduction gearing, arranged so that the whole unit of wheel, motor, and gear turns on the steering

The motors are four-pole, fully-enclosed machines, with two poles wound and two consequent poles. They are without interpoles, and are compound-wound in nearly all except the smallest sizes, such as the 5-cwt. lorry already mentioned. Each drives through a 10 to 1 gear consisting of a helical pinion and internal gear ring. Waterproof glands are provided where the cables enter the motor case, and the end covers are easily removable for access to the brushes. Ball bearings are used throughout. It is important to notice that the steering pivots are in line with the points of contact between the wheel and the road, which greatly reduces transmission of shocks to the steering wheel. Indeed, at the comparatively low speeds for which these vehicles are designed, the presence of the motor which has to be turned with the wheel to steer is scarcely felt, and the steering is very easy.

The main controller is of the plain drum type, and is contained usually in the steering column; it is seen with

FIG. 1.—FRONT VIEW OF 2½-TON CHASSIS.

FIG. 2.—PEDAL CONTROLLER WITH COVER REMOVED.

pivots. By this means it is claimed that a lighter and more efficient motor can be used than is possible with a gearless hub motor, while the advantages of front-wheel drive can be retained without rendering the steering at all difficult. There are also special features in the control gear, and, as regards the battery, it may be said at once that the well-known Tudor cell is employed exclusively.

The first vehicle that we inspected was a neat little 5-cwt. lorry, which was just ready for delivery to the Bootle Corporation. In this, the battery, of 40 cells rated at 182 ampere-hours, is slung under the centre of the chassis, while the small bonnet in front contains the controller and all connections, arranged to be easily accessible. This little car has a slightly smaller battery than the standard size, but with the standard 160 ampere-hour battery a mileage of fifty should be obtained on one charge, with a consumption of about 2.75 miles per kw.-hour charge. The motors are rated at 1 h.p. continuously with overload capacity up to 2½ h.p. each. The general features of the motors and control are similar to those of the large chassis described in more detail below.

A front view of another chassis which we saw, to carry loads of about 2½ tons, is illustrated in Fig. 1, from which the position of the motors geared to the front wheels is seen.

FIG. 3.—STEERING PILLAR AND MAIN CONTROLLER, WITH COVER RAISED.

the cover removed in Fig. 8. This is not employed to make or break the circuit, but only to vary the motor connections. It corresponds exactly to the change-speed lever of a petrol car, and there is a second controller which completes or breaks the circuit and controls the cutting out of the resistances. This is used for starting and manoeuvring in almost the same way as a clutch pedal. In its extreme forward position the circuit is broken, and as it is allowed to come back the resistances are gradually cut out. The separation of these parts of the controller has the advantage of giving a control system easily learnt by petrol drivers, and makes a sharp distinction between running and resistance steps, as resistance can only remain in circuit when the foot is bearing on the pedal. Again, all circuit-breaking is done on the small controller, the drum of which is cheap to renew. A view of the pedal controller is seen in Fig. 2. Five forward speeds, one reverse, and one braking position are provided for. The battery is arranged in two sections, which are put in series or parallel as required, and the motor armatures are kept always in series. The series field windings are also kept in series with each other, and the shunt windings are in two groups. For the first three forward speeds the two halves of the battery are in parallel. On the first speed the armatures are

in series with the series fields, and the shunt fields are excited by the battery in two groups in parallel; for the second speed the shunt windings are cut right out, and for the third speed the shunt fields are again connected as in the first speed, but the series windings are short-circuited. This notch, which corresponds to a plain shunt characteristic, can be used for regenerative braking from speeds higher than that at which it will drive. For the fourth speed the halves of the battery are in series, and one section of the shunt windings is excited off each half of the battery, thus placing them virtually in series. For the fifth speed the battery, armatures, and series windings all remain in series, while the shunt windings are disconnected. The main braking position puts the field windings one on to each half of the battery, disconnects the series windings, and short-circuits the armatures. The reverse corresponds to the first position with the armatures reversed. All the connections are well protected with drip-proof covers under the floor-boards, where the main fuses, ammeter shunt, &c., are also placed. A standard connection bolt is used, requiring one spanner, and all connections are copper on copper. A plug is provided by the withdrawal of which the driver can prevent the circuit being made in his absence, and a combined voltmeter and ammeter is mounted in a convenient position. In addition to the electric brake acting on the front wheels, there are internal and external mechanical brakes on the rear wheels.

The battery in the 2½-ton chassis is mounted under the centre of the vehicle, and is lifted and lowered by a special hoisting gear on the chassis, but the weight is taken normally by hooks. In the smaller vehicles, the hoisting gear takes the form of jacks on the battery trolley. The 2½-ton chassis has an available platform length of 11 ft. 5 in., and weighs

FIG. 4.—TRACTOR FOR A LOAD OF 8 TONS.

without battery 1 ton 5 cwt. The battery of forty cells, of a capacity of 280 ampere-hours, weighs 17 cwt., and is designed to propel the vehicle forty miles on one charge, with a consumption of 1.25 miles per kw.-hour charge. The motors are rated at 2.6 h.p. with overloads up to 6 h.p. From our trial run on one of these chassis we can say that the running is remarkably smooth and quiet, the control excellent, and the vehicle quick in getting away without undue current consumption. Intermediate sizes, for loads of 1 and 1½ ton, are also made, and have the same general features. It may be noted here that the Tudor Accumulator Co. are prepared to enter into very favourable maintenance contracts, varying according to the nature of the work to be done by the car, but in the neighbourhood of 1½d. per car mile run.

Another interesting vehicle which we saw, of a type new to this country, was a battery-driven tractor for drawing a load of 8 tons. Exactly the same general system is employed. The motors, in this case series-wound, are geared to the front wheels in the way already described, but the battery is contained in a large bonnet above the front axle. This, together with the fact that the back part consists of little more than the driver's seat, gives the vehicle the appearance of a somewhat mis-shapen racing car. The battery weighs about a ton and a quarter, and the whole tractor about 4 tons. The control is similar to that employed in the other Lloyd vehicles, but as the motors are only series-wound there is no provision for electric braking. The same standard controller parts are used, but to deal with the heavier current the contacts on the pedal controller are duplicated. In addition to powerful mechanical brakes on the tractor, provision is made for actuating brakes on the vehicles towed by a wire rope, and a compensating arrangement is used to allow for the effect of the play of the spring

draw hook. Without load the tractor can travel at thirteen miles an hour, and with its full load can maintain at least eight miles an hour on the level. In another form of tractor the back part can be attached rigidly to the vehicle to be towed, and the back axle of the tractor is raised from the road so that for steering purposes one vehicle only is formed. This form is a little lighter than the tractor which we saw. One of these tractors is illustrated in Fig. 4.

Another special Lloyd vehicle is a complete electrically-driven street-washing machine, with water-tank and revolving brush, which is already largely used on the Continent where, with all due deference to our local authorities, street-cleaning has reached a higher pitch of perfection. Lloyd electric vans are largely used by the Post Offices of Germany, Denmark, and Sweden, and a Continental cab company has used electric cabs of this make for seven years. In several German towns trucks drawn by Lloyd electric tractors are used to serve dust-destructors, and for various other municipal services these vehicles are in extensive use.

### DRAWN TUNGSTEN FILAMENT PATENTS

THE British Thomson-Houston Co., Ltd., as announced in our advertisement pages last week, has started actions against the following firms for injunctions to restrain the manufacture or sale of tungsten wire or lamps in alleged infringement of patent No. 21,513\*/06. The firms against which the actions have been commenced are: Duram, Ltd., Preston Engineering Co., Ltd., Yorkshire Incandescent Lamp Co., Ltd., West Yorkshire Electric Co., Corona Lamp Works, Ltd. (Corona lamps), The Electrical Trading Co. (R.C. lamps), United Electric Supply Corporation (B.M.F. lamps), Wolfram Laboratorium, Dr. Ing. Paul Schwarzkopf G.m.b.H., B. B. Fenn (Fenn lamps), Rose Bros., Lacey & Co., and A. C. Cossor, Ltd.

Patent No. 21,513/06 was granted to the B.T.-H. Co., to whom it was communicated by the G.E. Co. of America. It was amended on the application of the B.T.-H. Co. last year (ELECTRICAL ENGINEERING, September 12th, 1912, p. 510; December 19th, 1912, p. 703; and February 27th, 1913, p. 122). The claims now read:—

(1) The method of working tungsten, which consists in subjecting the metal in a coherent form to the action of heat while it is being operated on or manipulated. (2) The method of working tungsten which consists in heating the metal by means of an electric current while it is being operated on or manipulated. (3) In a method of working tungsten as claimed in the preceding claims, protecting the coherent metal against oxidation during the working operation by means of a coating of metal which may be subsequently removed, or by conducting the operation in a vacuum or a reducing, or inert, atmosphere. (4) Incandescent electric lamp filaments of tungsten manufactured by working the coherent metal, substantially as hereinbefore described.

The appeal by the owners of Patents Nos. 5,026/12, 5,027/12, and 5,028/12 to the Law Officer has resulted in the Comptroller's decision to refuse the grant being reversed in respect of No. 5,026/12, but upheld in respect of the other two. The opposition to the grant was made by the B.T.-H. Co. The patents were in the name of J. Hubers, on behalf of Julius Pintsch, Akt.-Ges. Patent No. 5,026/12 may be briefly summarised as describing a process in which a compound of tungsten is mixed with between 1 per cent. and 5 per cent. of an oxide, or an equivalent proportion of a compound of thorium, or other rare earth metal, an alkaline earth metal or magnesium or zirconium, or a mixture. The mass is squirted and reduced in hydrogen, so as to avoid the formation of crystalline particles. The metals are finally alloyed together. Alternatively, colloidal tungsten may be used. The case has been dealt with in ELECTRICAL ENGINEERING for June 26th, 1913, p. 386; August 21st, 1913, p. 481; and January 8th, 1914, p. 20.

**The Electrical Trades Benevolent Institution.**—The annual general meeting will be held at the Institution of Electrical Engineers, Victoria Embankment, W.C., on Wednesday, March 18th, at 2.30 p.m. Mr. A. Bruce Anderson (Vice-President) will be in the chair. The business includes election of members of the committee of management, from which the following retire by rotation, but are eligible for re-election: W. B. Esson, E. Garcke, T. E. Gatehouse, C. E. Hunter, C. Koettgen, W. Schmahl, A. A. Campbell Swinton, L. Thurnauer, and R. J. Wallis-Jones. As already announced, the annual Festival Dinner will be held at the Trocadero on March 25th at 7.30. Mr. Hugo Hirst will preside.

## OVERHEAD LINE CONSTRUCTION FOR MEDIUM AND LOW PRESSURES

WE conclude the important Paper on overhead line construction for medium and low pressures which Mr. A. P. Trotter read at the meeting of the Post Office Electrical Engineers on Tuesday, January 20th. The first part of the Paper was given in *ELECTRICAL ENGINEERING* for January 22nd.

Fig. 8 shows a construction for three-phase four-wire work, and Fig. 9 is a design which saves the use of a second arm

so that the use of larger currents need not yet be provided for.

The latest code of Board of Trade overhead wire regulations for medium and low pressures fixes the minimum size of wires at No. 11½ S.W.G., or 200 lb. per mile of copper wire. This is for mechanical purposes, and is about the same gauge as the German minimum. With these conditions the new proposals are that an earthed wire forming the neutral or intermediate conductor of a three-wire system, or the fourth wire of a three-phase four-wire system, may be used as a guard wire. This has been recognised by the introduction

FIG. 8.—A THREE-PHASE FOUR-WIRE DESIGN.

FIG. 9.—THREE-PHASE FOUR-WIRE DESIGN ADOPTED BY THE CLYDE VALLEY POWER CO.

FIG. 10.—CRADLE USED BY THE CLYDE VALLEY POWER CO.

FIG. 11.—MR. E. M. HOLLINGSWORTH'S TRIANGLE GUARDING AT ST. HELENS.

FIG. 12.—PROPOSAL FOR TIGHTENING TRIANGLE GUARDS.

FIG. 13.—PARALLEL GUARDS.

and gives a deep pocket. Guard wires for telegraph and telephone lines are not provided in these and the following cases, as public safety against broken wires is the object. In using the arrangement shown in Fig. 9 at an angle pole, care must be taken that the "J" spindle shall pull away from the wires; if it faces the side pull it may twist round. This design is being adopted by Messrs. Strain and Robertson for the Clyde Valley Electrical Power Co. The triangular arrangement of the phase wires was thought to be necessary for electrical balance, but this does not affect the lines under consideration. Some engineers prefer to place the wires in a vertical plane even if a neutral and a switch wire for street lighting make a total of five wires. This avoids the use of arms, and enables service wires to be led off neatly from the mains. The methods shown in Figs. 9 and 10 cannot be applied. A form of cradle (Fig. 10) used by the Clyde Valley Co. has suggested a modification which may be called a triangle guard. It may be applied to wires set in a vertical plane in several ways. These triangles are of the nature of the cross wires already described. Fig. 11 shows a three-phase four-wire line constructed by Mr. E. M. Hollingsworth at St. Helens. The fourth wire is run at the bottom. The triangle wires are insulated from the cross arm to carry out the regulation that a circuit shall be earthed at one point only. As there is no pull on the triangle wires it is rather difficult to make them straight and tidy. In order to tighten the triangle, the fourth wire might be held down as shown in Fig. 12. A modification of the triangle guard is shown in Fig. 13. A short bracket is used at the top, and a cross arm of equal length is fastened to the fourth wire. The guards become parallel, and the clearance is the same for each level. The guards would prevent the cross arms from twisting. This method has not yet been tried. A three-phase four-wire design by Messrs. Herbert Lewis and Fletcher, employing triangle guards and a split fourth wire acting as guard wires, is shown in Fig. 14. An arm parallel with the line is used to hold out the ends of the triangle wires. This is being used in South Wales.

The foregoing designs indicate that some formal regulations for guard wires as distinguished from tramway guard wires are now necessary. It is not usual for the pressure to earth to exceed 250 volts, nor for the current in street-lighting circuits to exceed 20 amperes at the present time,

of the words "which is not connected with earth" in B.O.T. Regulation (No. 9):—

Where an overhead line crosses, or is in proximity to, any other wire or metal, precautions shall be taken by the Undertakers against contact between a conductor which is not con-

FIG. 14.—THREE-PHASE FOUR-WIRE DESIGN WITH GUARD WIRES USED BY HERBERT LEWIS AND FLETCHER.

nected with earth and any other wire or metal by breakage or otherwise.

The requirement that there shall be at least two guard wires has been a Post Office rule since 1905. But both wires

need not be neutral conductors. In Figs. 6 and 7 one of them is an earth wire. It has been suggested that one of the wires may be used as a switch wire for turning out part of the street lamps at a late hour. So long as the upper wires are not intended to serve as guard wires this is a convenient arrangement. While all the lamps are alight both the guard wires would be neutral wires connected with earth at the works or sub-station, but when part of the lamps are switched off by disconnecting the return wire with "earth" this wire becomes alive. The reduction of the vertical distance between the guard wires and the neutral wires to 8 in. instead of the 2 ft. required in tramway work, and an overlap of 4 in. instead of 8 in., are valuable concessions which are highly appreciated by those engineers who have heard of them. These dimensions are used in the designs shown in Figs. 6 and 7. In triangular guarding and in Fig. 9 the clearance between the guard wires and the lowest phase wire seems to be small, but it must be remembered that the guards are near the poles and the swing of a wire is very small there. In overhead construction engineers can use insulators reasonably proportioned to their requirements. The neutral wires being earthed at the works or at a sub-station will always be within a few volts of earth, depending on the drop along the route, and on any out-of-balance currents. The simplest shackle insulators should suffice.

### ELECTRICAL DRIVING OF COTTON MILLS

A PAPER on Electrical Driving as Applied to Cotton Spinning, by Mr. W. G. Stokes, was read on Thursday last at a meeting of the Manchester Branch of the Association of Electrical Station Engineers. In the mill with which the author was connected power was taken from the mains of the Manchester Corporation at 6,500 volts three-phase, and stepped down to 440 volts on the premises. The average H.T. current taken was 125 amperes at a power-factor of 0.8, representing about 1,500 h.p. Both squirrel-cage and wound rotors were used, all up to 45 h.p., with one exception, being squirrel-cage. The motors were slung from the ceiling, some in steel towers outside the building, and others in the rooms themselves. They ranged from  $1\frac{1}{2}$  to 150 h.p. Star-delta starters were used from 10 to 18 h.p., and compensators from 18 to 45 h.p. For the wound rotor motors, grid resistance starters were used. Ironclad oil-break switches with overload and no-voltage releases were provided for all motors, except those with star-delta starters, which had no-voltage releases and fuses enclosed in the starter. Push-buttons were provided about the rooms for stopping the motors in case of emergency.

The disadvantage of unreliability formerly urged against electric driving had long been overcome. The chief advantages of the electric drive were its steadiness, flexibility, the ease with which power records could be kept, and the short space of line in which all the machinery could be started or stopped. The conditions were best when power was taken from a large supply system, and the superior steadiness of turbine-driven generating plant was such that it should always be used in preference to slow-speed reciprocating engines, where private plant was decided upon. Among the disadvantages which might be brought against electric driving was the cost of the generating plant where no public supply was available, and the fact that some boilers had to be retained for heating purposes, even where outside supply was taken. There were also occasionally troubles due to unskilled operation of starting gear. "Taking everything into consideration," continued the author, "steam driving is preferable to a private plant with a slow-speed reciprocating engine; where a turbo-generator is used, the honours are slightly in favour of electricity but when the supply is taken from an outside source electrical driving is far and away the better method of the two. In very case three-phase installations are meant, as this method is acknowledged to be the best for such work." Motors might either be coupled to the shafting by claw couplings or by rope drive; the latter was rather easier on the motor, but needed frequent adjustment. In the author's opinion, the best system was a compromise between group and individual drive, using in each department two motors of half the total h.p. The Paper then reviewed the power required by the machines in the different departments of a mill of about 70,000 spindles. In the preparation department the highest horse power required by any individual machine was about 8 for the combined opener and lap machine, the other machines took from 2 to  $3\frac{1}{2}$  h.p. each, and the total for the department

was about 60-h.p., which could be conveniently divided between two motors. In the card room there would be from 110 to 120 carding machines, which could be driven by two 70-h.p. motors. If fine yarns were spun, combing machines, each taking about  $\frac{1}{2}$  h.p. would be used; but usually the next department was the frame room where the cotton coming from the carding machines in the form of a sliver passed successively through drawing, slubbing, intermediate, and roving frames. The first two took about  $1\frac{1}{2}$  h.p. each, the last two  $2\frac{1}{2}$  to  $2\frac{3}{4}$  h.p. The total for this room would be about 160 h.p. So far the load was very constant, and the steadier the drive, the more uniform was the material. The actual spinning was done either on mules or ring frames. Mules gave a load varying, in the case of a 75-h.p. motor driving two pairs of mules, from 40 to 120 h.p. This variation occurred about four times per minute. With electric motors, the corresponding slight speed variation was more gradual than with steam drive; the threads, being kept taut, were less liable to break, and a more even product resulted. Four or five mules should be driven by one motor to equalise the load, and the machines should be arranged so that the draw took place at different times. Ring frames took from 6 to 10 h.p. per frame. Individual drive was often used with provision for varying the speed of each motor, but the author preferred group driving, with about ten frames to each group, with three-speed pulleys to each machine. This avoided waste of power in the rotor rheostats, the heating of which was also objectionable. For some weaving purposes the yarn had further to be rewound on to large rollers in "winding and beaming" frames, which took about  $\frac{1}{2}$ -h.p. each, and steadiness of drive was also of great value here.

### THE ELECTRIC VEHICLE COMMITTEE

At a meeting of the Electric Vehicle Committee, appointed by the I.M.E.A., on February 20th, Mr. J. S. Highfield (Chief Engineer, Metropolitan Electric Supply Co.) represented the Incorporated Association of Electric Power Companies, and Mr. J. A. Phillips (British Thomson-Houston Co.) and Mr. R. A. R. Bolton (Siemens Bros. Dynamo Works) represented the B.E.A.M.A. motor and switchgear sections respectively. The Technical Sub-Committee's recommendation was approved, that the 150-ampere size of concentric charging plug and receptacle, recently standardised by the Electric Vehicle Association of America (see ELECTRICAL ENGINEERING, Feb. 19th, p. 105), should be adopted as the standard for Great Britain, and that where a plug of larger capacity was required, it should have the same diameters, but lengthened contacts. It was not considered necessary that any provision should be made for earthing the shell of the plug. This plug is at present being manufactured in America by the Albert & J. M. Anderson Mfg. Co., of Boston. It was recommended that cab-tyre sheathed cable be adopted for charging leads. Negotiations were reported regarding co-operation with the International Electrotechnical Commission and the Engineering Standards Committee. The Commercial Sub-Committee presented a report on tariffs, and it was decided to circularise electric supply authorities in order to ascertain at what minimum prices they would be willing to supply electric energy for charging electric vehicles. Correspondence with the Local Government Board was reported, in which the Board signified that they were prepared to entertain applications from local authorities for sanction to borrow money for the purchase of vehicles, but would not be disposed to suggest that any particular form of self-propelled vehicle should be purchased. A letter was also read from the Car & General Insurance Co., Ltd., intimating that reductions in insurance rates for electric vehicles as against petrol cars would be granted.

**London Electric Supply Bill.**—Reference was made at the annual meeting of the Metropolitan Electric Supply Co. on Tuesday to the London Electric Supply Bill. In the main, the remarks of Mr. W. Harrison Cripps, the Chairman of the Company, were on the lines of those at the other meetings already reported in our columns, but he added that it had been in the Directors' minds for some time that it might be desirable to make an application to Parliament for combining the existing companies in order to get more or less what was suggested under the present Bill. There had, however, he said, been an attempt to "jockey" them, and it would seem that it was the idea of the promoters to get a bill with the approval of the L.C.C. outside the companies, but in view of the opposition of the companies it was not improbable that the measure would be dropped.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,382.

A series wound 500-volt 50-h.p. crane motor is fitted with a shunt wound magnetic brake, and this is provided with a discharge coil to take the "kick" when breaking the circuit. State how the necessary resistance and current carrying capacity of the discharge resistance are arrived at, and give the rating of the resistance when working in conjunction with a one-hour rated motor. If the motor is compound wound instead of "series," could the kicking coil be dispensed with?—A. R. T.

(Replies must be received not later than first post, Thursday, March 19th.)

### ANSWERS TO No. 1,380.

How does the rating of pipe ventilated motors compare with that of totally and semi-enclosed machines? In the smaller sizes, say 10 h.p. at speeds from 600 to 1,000 r.p.m., how is the air circulation effected?—E. W. A.

The first award (10s.) is given to "MARP" for the following reply:—

The rating of a motor is the maximum load which it will carry for a period of six hours and conform to the prescribed tests, viz., the temperature-rise of the machine must not then exceed 40° C., 45° C., or 55° C., according as it is of the pipe-ventilated, semi-enclosed, or totally-enclosed type. The ratings for pipe-ventilated and semi-enclosed machines are generally found to be so nearly alike that it has become standard practice to adopt the same rating for both types. The following table shows a few typical ratings for pipe-ventilated and totally-enclosed motors:—

110 Volts.				220 Volts.				440 Volts.			
Totally Enclosed.		Pipe Ventilated.		Totally Enclosed.		Pipe Ventilated.		Totally Enclosed.		Pipe Ventilated.	
Speed.	H.P.	Speed.	H.P.	Speed.	H.P.	Speed.	H.P.	Speed.	H.P.	Speed.	H.P.
1000	1	860	1½	900	1	780	1½	521	1	450	1½
970	2	840	2½	1650	2	1400	2½	950	2	820	2½
1150	5	1000	6½	1600	5	1325	7	1150	5	1030	6½
840	10	700	12½	875	10	750	13	625	10	540	13
310	20	260	26	690	20	575	27	320	20	270	25
590	30	500	40	390	30	320	40	380	30	300	37
650	40	520	60	570	40	480	53	560	40	460	58
625	50	500	80	760	50	650	75	480	50	400	71

From the above it will be observed that the outputs for pipe-ventilated motors are considerably greater than those for

the corresponding sizes of totally-enclosed machines. The effect of ventilation is especially marked in the case of overload ratings. Whereas a pipe-ventilated motor will stand a 25 per cent. overload for one hour and a 50 per cent. overload for one minute without injury, a totally-enclosed motor cannot with safety be loaded above 25 per cent. for more than a few seconds. The circulation of air through the machine is usually effected by the use of radial ducts in the armature. The standard practice is to insert a cast-iron space-block between the armature stampings every 8 in. For a 10-h.p. motor these air-ducts would be about ¾-in. wide. When the armature rotates, centrifugal force causes the air to move towards the outer edge of the armature, where it escapes, fresh air being drawn in at the centre. In the case of pipe-ventilated machines, a fan is fixed at the commutator end of the shaft, inside the case, and the cool air is thus forced axially along the armature, which is provided with axial air-ducts to assist the circulation. Where motors are used only intermittently, such as for crane work, the ratings are somewhat higher than those for continuously used machines. The rated load is then defined as the maximum load which the motor will carry for a period of one hour, and conform to the tests mentioned above.

The second award (5s.) is given to "W. H.," who writes as follows:—

Generally speaking a pipe-ventilated motor will give the same output as a similar size machine of the protected type, therefore as a semi-enclosed motor is presumably one with some form of protecting covers, such as perforated or expanded metal, the rating of such a motor would be slightly lower than that of a pipe-ventilated motor of similar size. If, however, the semi-enclosed motor is also fan ventilated, the output could be slightly increased, with the result that both types of motors would give about the same output. The characteristics of various makes of motors would vary the results outlined above a little one way or the other, depending as to whether the individual motor was adapted for pipe ventilation. For instance, in the case of D.C. machines, owing to the large air space in the interior of the frame, the pipe-ventilated motor would usually give slightly more output than the protected or semi-enclosed motor (unless, of course, the latter were fan ventilated); whereas in the case of induction motors, owing to the restricted air space in the frame, the opposite result would usually be obtained. In all the preceding statements it is assumed that an efficient fan is driving a sufficient quantity of air through the machine, and this is a matter which requires careful calculation, as otherwise either overheating will result if the quantity is too small, or a loss in efficiency will result if the volume of air passed is too large.

In the case of totally enclosed machines, quite a different problem arises; we are now dealing with machines in which the heat is not carried away by air coming in contact with the heated coils, but by radiation from the frame. From this it will be seen that the output of a totally enclosed motor depends to a large extent on the total radiating surface of the machine.

Again it depends to some extent on the peripheral velocity of the armature or rotor, and also upon the movement of the air inside the frame. For instance, introducing a fan into a totally enclosed machine will allow of a considerably increased output. This is probably due to the impinging of the heated air on the inside of the frame, and also to the breaking up of any hot air pockets which would otherwise form and limit the output by producing excessive local heating.

A fairly accurate formula for the permissible loss in totally enclosed motors is given below:— $W = (0.0044 + 0.0012 V)$  where  $W$  = watts dissipated per square inch of outside surface per degree C., and  $V$  = peripheral velocity of armature or rotor in thousands of feet per min.

From average results with a reasonable design of machine a totally enclosed motor at moderate speeds will develop about six-tenths of its output as a pipe-ventilated motor. At low speeds the totally enclosed output would be proportionately rather higher, and at high speeds, owing to the excessive core loss, the proportion would be lower until a speed is reached at which the core loss alone is equal to the maximum watts that the machine will dissipate. In this latter case the motor would, of course, develop no useful power.

With regard to the latter portion of the question, the air circulation of pipe-ventilated, direct-current motors would be quite good, but for reasons previously mentioned the corresponding size of induction motor would be slightly adversely affected by pipe ventilation.

## ELECTRIC TRACTION NOTES

A system of multiple unit control in which a booster set is used has been tried on the Metropolitan Railway of Paris, and has shown a great power saving. According to an article by Mr. C. Jacquin in the *Electric Railway Journal* (New York), the control depends on the Ward-Leonard principle, in which the pressure across the traction motor armature is varied by a motor-generator set. The motor field currents are varied independently by means of another motor-generator set mechanically and electrically associated with the first. The diagram shows the general scheme of connections. F, G, and H represent the motor-generator set. F and G represent the booster group, and H a small regeneration dynamo. F is always in series with the traction motors through the two-way switch 3. By means of switch 4 the regeneration dynamo is joined in parallel with the field coils of the traction motors. This machine serves to vary their excitation. In starting from rest, switch 1 is closed, and the booster group brought up to normal speed by means of the

resistance R. Switch 3 is then closed according to the direction of propulsion. At first the E.M.F. of F opposes the line pressure, and so F motors G as a generator, which therefore returns energy to the line. As the traction motors accelerate, however, the pressure across F falls to zero, and the traction motors are simply in series. Then G motors F as a generator, and a pressure equal to the line pressure, and in the same direction, is produced across the traction motors. Thus the equivalent of ordinary parallel operation is obtained. Test curves show an energy-saving of about 20 per cent. with this control. During running the control acts automatically to maintain a constant current. The weight is about 4,070 lb. per motor car, but two contactors, reverser and starting resistances, weighing 990 lb., are eliminated.

At the annual general meeting of the London & North Western Railway it was stated that it is hoped to have the power-house at Stonebridge Park completed by the spring of next year, and simultaneously through services running from Watford to Broad Street, as well as with the Bakerloo Railway. It is also anticipated that the electric train service will be running between Willesden and Earl's Court in April or May this year.

Reference was made at the annual meeting of the Midland Railway to the progress of the electrification of the line to Southend. The  $7\frac{1}{2}$  miles of track from Barking to Upminster is to be widened to four lines, and in connection with the electrification scheme the General Manager, having paid a visit to America, has come to the conclusion that even if there was no obligation on the Company to electrify the line, this would be necessary sooner or later in order to cope successfully with the rapidly increasing population in the Tilbury and Southend district, and the important extension which the Port of London Authority is effecting at the Docks. The estimated cost of the work is about £900,000, and it is for this purpose that new capital powers of £1,000,000 are being asked for in a Bill this session.

The accounts of the Liverpool Corporation Tramways for 1913 show that after meeting capital charges and placing £54,163 to reserve, renewal and depreciation, a contribution of £100,000 is made in aid of the rates. The net profit for the year amounted to £154,162, which is an increase of £20,304 over 1912. The contribution to relief of rates is £33,071 in excess of the amount handed over for this purpose in 1912.

The proposed tube railway under the Tyne between North and South Shields, in connection with which a Bill has been deposited this session, has been abandoned by the promoters. A similar scheme was actually sanctioned by Parliament some years ago, but the powers were allowed to lapse. The share capital of the proposed company which has now been abandoned was £265,000.

The Brighton Corporation has given official notice of its intention to go to arbitration to settle the differences between itself and the Hove Corporation as to the trolley omnibus system.

The annual meeting of International Railophones was held last week, when it was stated that although considerable efforts are being made to interest the German Imperial Railways in the system, the energies of the Company have been devoted in this country to the trial plant on the Midland Railway. Almost immediately after the Aisgill railway accident the Midland Railway Co. decided to instal at its own expense a trial plant just outside Derby. Negotiations are now going on for the sale of the British and American patents.

A proposal by the directors of the Bath Electric Tramways Co. to postpone the preference dividend for four years in order to repay certain overdrafts to the bank, has been received with a good deal of dissatisfaction, and a committee has been appointed to confer with the Board as to the best arrangement for financing the Company. The past year has been the best in the history of the Company as regards mileage run, traffic receipts and net earnings.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Telegraph engineers will be very sorry to hear of the death of Mr. John Gott, Consulting Electrician to the Commercial Cable Co., on Sunday last. Mr. Gott, who was seventy-four years of age, has been actively associated with the development of submarine telegraphy, and at the time of his death was engaged on perfecting a signalling system to avoid re-transmission, and to eliminate the syphon recorder. The impulses in this system are alternately positive and negative (*ELECTRICAL ENGINEERING*, February 27th, 1913, p. 20, and April 3rd, p. 193).

The reorganisation scheme of the British wireless coast stations, which is now in progress by the Post Office, is dealt with by Mr. E. S. Perrin and F. W. Davey in the current issue of the *Post Office Electrical Engineers' Journal*. The scheme provided for the purchase of the station at Cullercoats from the Poulsen Co. The transmitting apparatus is of the ordinary De Forest direct-coupled type of about 2 kw. At the North Foreland station the power plant has been duplicated and the original apparatus improved. Five new stations have been built at Niton, St. Just, Fishguard, Malin Head, and Valencia (West of Ireland). These use musical notes with spark frequencies of 300, 400, 300, 400, and 600 respectively. The power used in these stations is now  $1\frac{1}{2}$  kw., 5 kw., 3 kw., 5 kw., and 10 kw. respectively. The old stations at Lizard and Rosslare are superseded. The first station to be designed by the Post Office is the one at Fishguard. The arrangement is similar to that at North Foreland. A 3-kw. motor alternator is supplied with power derived for the G.W. Railway Co.'s station, and feeds a high-pressure transformer at about 300 volts 150 cycles through an iron-core choking coil. The transformer secondary is connected through two air-core choking coils to a rotary disc discharger. There are two circuits from the discharger—one tuned to a 600-metre wave and the other to a 300-metre wave. The same aerial is used whichever circuit is operative, but in the latter case, however, direct-coupling, and in the former case inductive coupling, is used. The secondary pressure of the transformer is 7,860 volts, but it is insulated to withstand a working pressure of 17,500 volts. The discharger has twelve studs. There are two discharging points, arranged so that the studs are opposite both at the same instant. It is capable of fine adjustment on the alternator shaft. The mast for the aerial is an ordinary three-part ship's mast, 150 ft. high, recovered from the old Seaforth wireless station. The anchorages are made up of best railway metals set in concrete. As the ground is rocky, the type of earth provided gives a capacity earth in addition to the ordinary earth. The receiving gear is connected across the earth arrester gap and consists of a multiple tuner which can be worked with either a magnetic or crystal detector. Low-resistance telephones are used. The range of this station is reckoned about 250 miles in the daytime, but it has taken traffic at 1,200 miles at night. The connections and general lay-out of the internal transmitting plant at St. Just follow closely on the lines of Fishguard, except that two aeriels are used. Power is generated on the premises. Malin Head is also similarly designed, but there is only one aerial. The

stations at Valencia and Niton will shortly be completed. The three other large stations included in the scheme are those at Caister, Crookhaven (West of Ireland), and Seaforth, and there are also several smaller stations for special purposes.

The Committee for Radiotelegraphic Investigation of the British Association proposes to undertake a special investigation into the effect on the propagation of electric waves of the total eclipse of the sun on August 21st next, which will be visible in Greenland, Norway, Sweden, Russia and Persia. It is desired to study the effect of the period of darkness on the strength of signals, and also the variation produced in natural atmospheric discharges. The co-operation of stations in various parts of the world is invited, and those willing to make observations and record them on special forms supplied by the Committee, are asked to communicate with Dr. W. H. Eccles, University College, Gower Street, W.C.

Mr. Hobhouse, in reply to a question in the House of Commons on Thursday last, gave some further particulars as to the rearrangement of the African stations of the Imperial wireless chain, whereby the Egyptian station will communicate with England (1,950 miles), India (2,560 miles), and East Africa (1,900 miles). No further formal agreement will be necessary with the Marconi Co.

On Monday a House of Lords Select Committee was appointed to inquire into Lord Murray's dealings in Marconi shares in connection with the Imperial wireless chain, at the time the Post Office was negotiating with the Marconi Co. The Committee consists of Lord Halsbury, Lord Loreburn, Lord Sanderson, Lord Desart, and Lord Charnwood.

The British L. M. Ericsson Manufacturing Co. shows a profit of £37,738 for 1913, and an 8 per cent. dividend is declared. The sum of £10,508 is transferred to depreciation, and a reserve with a sum of £5,000 has been started.

The Paramaribo-Cayenne cable of the Compagnie Française des Câbles Télégraphiques was repaired on the 2nd inst., and the Persian lines between Shiraz-Kazeroon were down on the 14th inst.—The Bassorah-Fao line was not working on the 5th, and also, as from this date, deferred telegrams were admitted by Morocco.—Failures occurred in the Teheran-Meshed line and the Perim-Djiberiti cable, and these and the Fao line were repaired on the 6th inst.—The Shiraz-Kazeroon line was again working on the 7th inst., and the Oran-Tangier cable on the 8th.

**Popularising Electricity.**—In order to increase the number of consumers and the loads of existing ones, the South Metropolitan Electric Light & Power Co., Ltd., is promoting a well-arranged Exhibition at its offices and showrooms, 181-185 High Street, Lewisham, S.E., from to-day until Saturday 21st. The Company has permanently enlarged its showrooms, and is now enabled to show representative examples of all kinds of lighting fittings and heating and cooking apparatus, as well as the numerous useful and ornamental small accessories, to the greatest advantage. During the Exhibition two of the offices on the first floor have been completely fitted up to demonstrate how useful electricity can be in the bedroom and dining-room. These rooms are most artistically arranged. Short lectures are given several times daily. In the course of these, an offer is made to wire the smaller houses in the Company's area complete for nine lighting points, complete with fittings, lamps, shades, switches, &c. The Company estimates what the lighting bill should be, and if after three months this exceeds the estimate by more than 10 per cent., the Company will remove the installation without charging the consumer anything except the energy charge for the three months. If, however, the Company are correct in their estimate, the consumer is to pay the net cost of the installation by cash down, by instalments spread over three years, or a quarterly rental can be paid. Some literature has been prepared in connection with this campaign, which is one which should bring substantial results to the Company whose enterprise worked it out. A feature of the energy charge for heating and cooking is that if during the summer quarters no energy is taken for these purposes, no charge is made for the meter rent.

**Miners' Safety Lamps.**—Mr. S. B. Haslam has written us to point out that the condensed version of his remarks at the meeting of the Association of Mining Electrical Engineers, published in our "Summary" last week, is not entirely accurate. As stated in the fuller report of the discussion on p. 130 of our last issue, Mr. Turquand, in his Paper, estimated the life of the secondary battery of a miner's lamp at 500 charges and discharges. Mr. Maurice pointed out that 500 shifts meant about 20 months, and estimated the average life at only about a half of this. Mr. Haslam agreed with Mr. Maurice that this was about the life of the positive plate (which in his experience with "Ceag" lamps lasted 8 to 12 months), but said that the negative plate would last twice as long.

## MODERN ENGINES AND POWER GENERATORS.

By Rankin Kennedy, C.E.

The Coupon below entitles any reader to a complimentary copy of an illustrated booklet, describing what is probably the most valuable work upon this subject ever published.

The importance of the subject is growing day by day, and "The Book of Modern Engines and Power Generators" can easily prove of the greatest value to those who desire to be fully informed upon the latest developments in every branch of the subject.

The author, Mr. Rankin Kennedy, C.E., is well known as an authority on his subject, and in this work he explains in the clearest and most thorough manner the design and construction of prime movers; the term is here used in its widest sense, as it applies to all engines, whether worked by petrol, oil, steam, air, gas, water, or electricity, and as it includes all machinery and processes connected with power generators and distribution.

### ENTIRELY UP TO DATE.

Moreover, all these subjects have been brought entirely up to date. The previous Edition of the work achieved such an immediate success, that for the new and Revised Edition, the scope of the work has been widened and extended so as to cover every branch of the subject, by the addition of a great amount of new matter, and many new illustrations of very great interest and high value.

This new Edition is indeed already recognised as the standard work on its many varied subjects, including Rotary Engines, Gas Turbines, Gas Engines, Oil Engines, Petrol Engines, Suction and Producer Gas Engines, Blast Furnace Gas Engines, Marine Engines of every design and type, Compressed Air Motors, Air Compressors, Refrigerating Engines, Windmills, with electric storage, Fluid Hydraulic Engines, Water Pressure Engines, Hydraulic Rams, Water Pressure Turbines, and Water Raising Engines, Centrifugal Pumps and Air Lifts, Power Distribution and Transmission by Gearing, Water Pressure, Compressed Air and Electricity, etc., etc.

### OVER 2,000 ILLUSTRATIONS.

The work is profusely illustrated by diagrams, text-cuts, and plates. In all there are over 2,000, every one of great practical utility to the engineer.

Enough has been said to show that this work is indispensable to all electrical, mechanical, steam, and hydraulic engineers, and to all who are concerned with manufacturing, designing, draughtsmanship, electro-chemical, and metallurgical work, with automobiles, tramways and railways, boilers, shipbuilding, collieries and mines, etc.

We would advise those who are determined to keep abreast with all the latest specialist knowledge concerning every detail of their profession to send for the free booklet which is supplied by the publishers to those mentioning this paper.

## A FREE BOOKLET.

To the CAXTON PUBLISHING Co., LTD.,  
97, Surrey Street, London, W.C.

Please send me, free of charge, a copy of the book describing the "Book of Modern Engines and Power Generators," and showing how it can be obtained for a first payment of 1s. 6d., the balance to be paid by small monthly payments.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published March 5th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

28,513/12. **Ignition.** F. G. L. BIBBLECOMBE and G. THOMAS. To provide two or more sparking circuits for the ignition of internal combustion engines, in which ordinary plugs may be used, one circuit remains as usual and the others are inductively coupled to it. Both circuits are earthed. An external spark gap is provided in the main circuit to ensure that the added circuits will continue to work on a failure of the first sparking plug. Three figures.

788/13. **Submarine Telephony.** A. WILLIAMS. The insulation is made somewhat leaky, and a "pilot" or "escort" current, which is sent through the cable, insulates the high frequency impulses by its polarising effect. It is said that the capacity is practically eliminated. One figure.

802/13. **High Frequency Currents for Wireless.** G. MARCONI. Wires are arranged on the surface of a cylinder parallel to its axis, and connected at opposite ends. They are in series with a source of current. A co-axial cylinder is similarly arranged, and one or both is rotated. Four figures.

4,773/13. **Commutation.** B. LJUNGSTRÖM and A. D. WIDSTRÖM. The risers to the commutator form one of the windings of a transformer. The other winding is connected with a synchronous A.C. generator producing a frequency equal to the frequency of commutation. It is arranged that the number of phases is one less than the number of segments with which the brushes can be in contact simultaneously. The E.M.F.'s in the two risers of each short-circuited coil are opposed by the transformer E.M.F.'s. Six figures.

27,348/13. **Multiple Recording Instruments.** HARTMANN & BRAUN A.-G. Bodies bearing different marking colours take the form of an endless chain, so arranged that on the change over of the recording mechanism to a fresh circuit a forward motion of the series of colours is automatically effected. The chart is between the colours and the marker. Ten figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** A. W. PENROSE & Co. and OWEN, 26,913/13; KORTING & MATHIESEN A.-G., 27,878/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** LEITNER [Automatic supply systems] 1,413/13; B. T.-H. Co. (*G. E. Co., U.S.A.*) [Insulation] 8,417/13; FERGUSON and JOHNSTONE [Lighting, heating, and ventilating moving vehicles] 9,009/13; WADE (*Schneider and Naujoks Elektrizitäts Ges.*) [Lighting operating tables] 10,098/13; B. T.-H. Co. and MCCARTHY-JONES [Automatic circuit regulation] 25,163/13.

**Dynamos, Motors, and Transformers:** VANDERVELL and MIDGLEY [Commutating arrangements] 5,014/13.

**Electrometallurgy and Electrochemistry:** SCOTT [Electrode for nitrogen fixation furnaces] 4,723/13 and 4,724/13; [Regulation of arc furnaces] 4,725/13; MARGUET [Sodium and other alkali metals] 11,278/13; MACK [Transformers and welding, smelting and similar apparatus] 19,512/13.

**Ignition:** TATE [Engine starting] 5,818/13; MARKS (*Siemens & Halske A.-G.*) [Spark plug] 17,514/13; RENAULT [Engine starting] 18,252/13; UNIONWERKE MEA GES. ELEKTROTECHNISCHE FABRIK EISENWERK [Contact breaker] 23,739/13.

**Incandescent Lamps:** GIUSTI, 8,568/13.

**Instruments and Meters:** PHILLIPS and SMITH [Moving iron] 13,844/13; SIEMENS BROS. (*Siemens & Halske A.-G.*) [For high-frequency currents] 17,126/13.

**Storage Batteries:** DE SEDNEFF, 1,066/13; HEAP and CHLORIDE ELECTRICAL STORAGE CO., 6,462/13.

**Switchgear, Fuses and Fittings:** SPAGNOLETTI and JOYCE [Fuses] 3,111/13; SIEMENS SCHÜCKERTWERKE GES. [Fuses] 6,880/13; LUNDBERG and PEGG [Switches] 7,085/13; BLACK [Contact-makers] 8,561/13; CONNER and KAHL [Switches] 14,816/13; HUBBELL [Locking of lamps] 15,576/13; VOIGT & HAEFFNER A.-G. [Polyphase motor starters] 19,648/13; SIEMENS BROS. (*Siemens & Halske A.-G.*) [Connectors for electro-medical apparatus] 25,141/13.

**Telephony and Telegraphy:** POLLEN and ISHERWOOD [Order telegraphs] 4,164/13; WESTERN ELEC. CO. (*Western Elec. Co., U.S.A.*) [Selective signalling] 4,618/13; CHAMBERS [Apparatus for wireless] 4,777/13; GRAHAM and RICKETS [Order telegraphs] 4,829/13; MARKS (*Submarine Wireless Signalling Co.*) [Submarine signalling] 5,250/13; BREGUET and FRÈRES BREGUET ET CIE [Prepayment automatic telephones] 8,615/13; CLORIUS [Con-

tact and fire alarm] 8,741/13; DITCHAM and GRINDELL-MATTHEWS WIRELESS TELEPHONE SYNDICATE [Production of oscillations for wireless telephony] 14,927/13; SIEMENS & HALSKE A.-G. [Semi-automatic telephony] 21,766/13; GRAHAM [Telephone exchange switchboards] 27,754/13.

**Traction:** A. G. BROWN, BOVERIE [Hauling plant] 26,430/12; MARKS (*Gilman*) [Railway signalling] 7,585/13.

**Miscellaneous:** THOMSON (*Seemann*) [Displaying illustrations synchronously with the operation of a talking machine] 3,715/13; HOPKINS [Tachometers] 4,671/13; LA PEARL [Changeable sign] 16,752/13; NICHOLAS [Mine signalling] 17,816/13; STANLEY [Insulated receptacles] 17,832/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Arc Lamps:** CARL ZEISS [Search lights] 1,714/14.

**Ignition:** GIORGI [Engine starting] 1,771/14.

**Switchgear, Fuses and Fittings:** SCHÖELLER & Co. [Ampere- and volt-meter for vehicles] 27,473/13; A. E. G. [Current collectors] 3,594/14.

**Telephony and Telegraphy:** VON LEPEL [Periodically modifying high frequency currents] 3,171/14.

**Miscellaneous:** MCKAY [Portable electric lamp] 2,495/14.

### Amendments to Specifications

7,524/12. **Signalling on Road Vehicles.** O. F. WERNDORF. As a result of the extended investigation under Section 8, a statutory reference to specification No. 2,667/12, in the name of G. S. Matthews, has been inserted in the specification, which deals with signalling the intended movements of a vehicle.

18,689/12. **Arc Lamp Electrodes.** B. T.-H. Co. (*G. E. Co., U.S.A.*). This specification, relating to electrodes of carbon, an earth titano-fluoride and an alkaline titano-fluoride, has now been amended by way of disclaimer under Section 8.

29,389/12. **Refractory Material for Furnaces, &c.** B. T.-H. Co. (*G. E. Co., U.S.A.*). This specification relating to a refractory material of silica, carbon, or aluminium silicate and manganese oxide, has been amended by way of disclaimer.

### Grant of Patents Allowed

3,878/12. **Shaft Rotation Indicators.** P. R. KEEPIE and H. M. R. MADDICK. The Law Officer has decided to allow the Grant of this Patent, thus upholding the Comptroller's decision.

9,673/12. **Shaft Rotation Indicators.** J. C. CLARKE and CHABURN (SHIP) TELEGRAPH CO. The Law Officer has decided to allow the Grant, thus upholding the Comptroller's decision. 1,420/13 and 1,439/13. **Electrolysis.** H. M. DU BOIS. The Comptroller has decided to allow the Grant of these Patents (see ELECTRICAL ENGINEERING for Oct. 23, 1913, p. 596), subject to the specifications being amended.

### Restoration of Lapsed Patent

14,495/06. **Railway Signalling.** W. REID. This Patent, which lapsed owing to non-payment of the renewal fee, has been restored.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

5,046 of March 16th, 1900. **Electrolytic Mercury Meters.** A. WRIGHT and REASON MFG. CO. The current which has passed through the meter is registered by utilising the decrease in weight of the mercury anode, or by the increase in weight of the cathode. In either case the electrode is made movable and adjusted to move after a given decrease or increase in weight. In the latter case the cathode is provided with a receptacle to catch the mercury which may fall off the cathode itself. A motor-driven counting train may be used.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, &c.:** L. WILSON [Automatic feeder protective gear to cut out a faulty feeder only] 25,219/04; A. J. BOULT (*J. L. Woodbridge, U.S.A.*) [Regulation of D.C. circuits fed by a storage battery and converter] 25,934/05.

**Dynamos and Motors:** ALLMÄNNA SVENSKA ELEKTRISKA AKTIEBOLAGET and J. L. LA COUR [Polyphase commutator machines] 24,581/08.

**Electrochemistry and Electrometallurgy:** A. LÉVY [Simultaneously cleaning and plating metal articles] 25,553/07; W. BORCHERS [Reduction of titaniferous iron ores] 24,590/08.

**Incandescent Lamps:** A. C. HYDE [Iron-nickel leading-in wires] 24,918/04.

**Switches:** J. APPLEBY and A. E. DREW [Time switches] 24,618/08; M. W. BRÖNDUM [Time switches] 24,793/08.

**Miscellaneous:** E. J. REID and W. B. GOOD [Signalling for pneumatic tubes] 24,909/08.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 153. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**CINEMATOGRAPH THEATRE SUPPLIES.**—A new list entitled "Everything Electrical for Cinemas, Theatres, and Public Buildings Generally" has just been issued by the Supply Department of the British Westinghouse Co., Ltd. (Long Millgate, Manchester). This is as complete as its title would indicate, and contains particulars of incandescent, mercury-vapour, and arc lamps and accessories, carbons, lighting fittings, including many designs for indirect and semi-indirect lighting, hand lamps, number indicators, signs and illumination material, stage lighting accessories, fans, heaters, and vacuum cleaners, &c. The company will send a copy to anyone if the request is accompanied by a trade card. The company asks us to state that they are holding a special exhibition of this class of apparatus at 179 Wardour Street, W., from March 16th to 23rd.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**MOTOR-CAR WIRING.**—A leaflet from Siemens Brothers & Co., Ltd. (Woolwich), gives particulars of special leads for motor-car ignition circuits, including five varieties of low tension and the same number of high-tension cables, some braided, and some plain rubber covered.

**INSULATING MATERIAL.**—We have received from the Paracit Co., of Frankfort-on-the-Maine, a pamphlet in German discussing the general question of insulating varnishes, and describing the company's special compound known as "Paracit." Interesting results of tests of dielectric strengths are given of various qualities of the material tested under different conditions.

### HOLDERS FOR HALF-WATT LAMPS

WE have received particulars from the British Thomson-Houston Co., Ltd., of an improved type of

VENTILATED "GOLIATH" HOLDER FOR  
HALF-WATT LAMPS.

"Goliath" holder for half-watt lamps. The ordinary "Goliath" holder is somewhat unsightly, because of its size,

but the graceful lines and neat design of the new holder make one oblivious of mere dimensions. The holder is made of brass, and the case is ventilated by vertical apertures around the lower part, and lozenge-shaped apertures around the top. Ventilation between the cap of the lamp and the interior of the holder is secured by means of a vertical channel cut across the thread of the holder. For interior lighting it is an advantage to have a holder which is so good-looking that no elaborate precautions need be taken to conceal it. The new B.T.H. "Goliath" holder, as well as several other patterns, including brass and porcelain holders, fitted with cord grip, suspension hook, or drilled and threaded tops, can be seen and purchased at Mazda House, 77 Upper Thames Street, E.C.

### ELECTRIC DRILLS

IN the early days of electric drills there was a strong tendency in some quarters to reduce the dimensions of such apparatus below the point necessary for reliability, with the result that their reputation suffered. Experience in running and in design has, however, now renders it possible to produce a more compact and lighter electric drill than formerly without sacrifice of other good qualities, and a

WITTON-KRAMER ELECTRIC DRILL.

good example of a modern design is the "1914 Runthru No. 5" drill, constructed by the Witton Kramer Electric Tool & Hoist Co. (for whom the General Electric Co., Ltd., 67 Queen Victoria Street, E.C., are the sole selling agents), which we illustrate here. In this a considerably more powerful tool has been produced without any increase in weight, which stands at 57 lb. These improvements have been effected mainly by reducing the waste space in the top cover and gear-box, and have not in any way been procured by a reduction in the strength or efficiency of the mechanical or electrical working parts. This tool will drill a 1½-in. hole in cast-iron at the rate of 1 in. per min.

## THERMAL CIRCUIT-BREAKERS

WE have received from Morris & Lister (London), Ltd., 3 and 4 Palace Chambers, some interesting information and particulars as to the application of the thermal principle to circuit-breakers. The protection of circuits by thermal means in the form of ordinary fuses is still practised to a very large extent, in spite of its disadvantage of spark-production and inconvenience in replacement, and this is largely due to its power of taking into account the duration

FIG. 1.—SINGLE-POLE CIRCUIT-BREAKER.

as well as the magnitude of the overload. It was with the object of retaining this latter feature, while doing away with the objections of the ordinary fuse, that Messrs. Morris & Lister took in hand the design of their thermal circuit-breaker. The latest forms of this are illustrated in the accompanying figures, and their general principle is as follows:—The cradle of the breaker is provided with a spindle, around the axis of which move the handle lever, a push-in piece or catch carrier provided with a mushroom-headed bolt, and the main arm carrying the contact blocks. Between the two main contact blocks two thermal strips of metallic alloys are fixed, and carry either the whole or a definite shunted part of the main current. When the breaker is "in," the contact blocks bed on brushes attached to the base. When the handle lever is pushed upwards to put the breaker in, it presses on the push-in piece and causes the mushroom bolt to engage the spring catches which are provided on the

FIG. 2.—THREE-POLE ENCLOSED TYPE.

strips, and thus throws the main arm on to the brush contacts. When the main arm is well home, the push-in lever is locked in place by a spring which engages with a catch. When an overload of sufficient duration occurs, the strips become slightly heated, expand, and allow their catch-pieces to slip over the head of the mushroom-bolt, permitting a pull-out spring to act and throw the switch-lever into the "out" position. As the main arm comes out, cam surfaces at its lower end press down the retaining spring and release the push-in lever also. Before the circuit-breaker can be

## Time Costs Money

and Machining takes time and moreover does not always give perfect interchangeability — an essential requisite of such pieces as that here shown.

## "PRANA" DIE-CASTINGS

save machining—*ergo*, time and money, and are accurate, reliable and interchangeable.

**BUT THEY MUST BE "PRANA"**  
—British made; "tough and true."

Write for Leaflet E.E. 6 to  
**AERATORS Ltd.** UPPER EDMONTON, LONDON, N.

closed again the locking mushroom bolt must be drawn back through the catch-pieces by pressing the handle downwards. Auxiliary metal and carbon contacts are provided, as well as the main contacts, and a magnetic blow-out can be added if desired. Special no-voltage release devices of simple design are employed where required. The temperature of the

FIG. 3.—CURVE SHOWING TIME ELEMENT FEATURE.

strips never exceeds a very moderate figure. Variations of the temperature of the surrounding atmosphere are compensated for by the expansion or contraction of the parts to which the strips are fixed. These breakers possess all the advantages of the free-handle feature, and are equally suitable for continuous or alternating currents.

**Long Life of Carbon Lamps.**—The Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), have received some remarkable testimony of the durability of their carbon lamp. It appears that a travelling crane lighted by 13 lamps had a serious collision, but although all had been running 1,600 hours, none were damaged. In their subsequent careers seven of these lamps completed lives varying from 1,950 to 4,900 hours, and the remainder are still intact. These records are, however, beaten by a Royal Ediswan carbon signalling lamp on one of the Northern Railways, which gave its light for 22,607 hours, equivalent to a continuous run of more than two years and a half.

**Bruce Peebles Staff Ball.**—The annual staff ball of Bruce Peebles & Co., Ltd., Edinburgh, was held on February 27th, at the North British Station Hotel. In the speeches which were made at the supper it was pointed out that not only had the Company had a successful year, but 1914 was promising to be better still. The honours of the evening were shared by the joint managers of the Company, Messrs. S. E. Bastow and J. H. Bunting, the former, with Mrs. Bastow, holding a reception at the beginning of the evening, and the latter presiding over the supper.

**Alkaline Accumulator Manufacture.**—The Hagen Accumulator Works, in addition to holding a licence under the Jungner patents for the manufacture of alkaline storage batteries, has also acquired from the firm of Erwin Achenbach, Hamburg, the rights of the Achenbach-Pörske alkaline cell.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Bedford.**—Twelve months' supply of high- and low-tension cables, meters and metal filament lamps. Borough Electrical Engineer. April 1st. (See advertisement on another page.)

**Carlisle.**—A Local Government Board inquiry was held last week concerning a loan of £29,940 for electrical extensions. There are at present in hand applications for 520 kw.

**Colchester.**—Mains extensions are to be carried out in a number of streets.

**Dartford.**—In connection with the application for a loan referred to on page 109 of our issue for February 19th, the L.G.B. has suggested that the Council should call in a consulting engineer to report upon the position in respect to the standby plant. No objection is taken to the proposed agreement with the West Kent Electric Power Co.

**Derby.**—An expenditure upon the electricity undertaking amounting to £12,540 is contemplated.

**Dover.**—Mains extensions at an estimated cost of £370 are to be carried out.

**Dundee.**—Twelve months' supply of electrical stores. General Manager, March 20th.

**Dunfermline.**—The Fife Electric Power Co. intends to increase considerably the plant at its Townhill power station.

**Exeter.**—It is proposed to instal a 1,000-kw. high-pressure turbo-alternator at an estimated cost of £6,200.

**Farnworth.**—A 500-kw. rotary-converter, transformer, switchgear, and cable are required. Borough Electrical Engineer. March 18th.

**Halifax.**—Application is to be made for sanction to a loan of £7,000 for the purchase of a 1,000-kw. 50-cycle rotary-converter, switchgear, water-tube boiler and mechanical stokers.

**Malvern.**—The question of installing a new generating set, or taking a bulk-supply from the Worcester Corporation, is under consideration. Further reference is made to the matter in our Local Notes columns.

**Rawtenstall.**—Water-tube boilers, superheaters, mechanical stokers. Borough Electrical Engineer. March 23rd.

**South Africa.**—According to the *African World*, the Cape Town Council proposes to borrow £100,000, and the Lady-smith Council £7,000, for electrical purposes.

**South Shields.**—Induced draught plant motors and control gear. Borough Electrical Engineer. March 13th.

**Street (Somerset).**—A contract for street electric lighting is under consideration by the Council.

**Swindon.**—Cooling tower. Borough Electrical Engineer. March 18th.

**Swinton and Pendlebury.**—Twelve months' supply of cable, joint boxes, joint box compound, &c. Borough Electrical Engineer. March 26th.

**Torquay.**—A loan of £5,000 is to be taken up for mains extensions.

**Walsall.**—Loans of £2,092 for plant extensions, £1,092 for substation equipment, and £1,000 for mains are to be applied for.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Bradford.**—Cinematograph theatre. Architect, J. Jackson, Sunbridge Road.

**Glacton.**—New municipal offices.

**Crowe.**—New co-operative bakery. Architect, G. E. Bolshaw, 106 Lord Street, Southport.

**Holmfirth.**—The new Council school is to be wired.

**Manchester.**—Electric lighting installation at Heald Place school, Rusholme. Town Clerk. March 18th.

**Middleton.**—New town hall.

**Newport.**—New town hall.—New works for British Mannesmann Tube Co.

**Nottingham.**—New baths at Muskham Street. City Architect.—Children's Home for Guardians. Architects, Sutton & Gregory, Bromley House.

**Rochdale.**—New school.

**Swansea.**—Isolation hospital buildings. Architect, H. A. Ellis, 10 Fisher Street.

**Torquay.**—New technical school.

**Walsley.**—New town hall.

### Miscellaneous

**Barrow-in-Furness.**—The pumping plant at Salt House is to be converted to electrical drive. Borough Electrical Engineer.

**Clacton-on-Sea.**—The lighting of the principal streets with arc lamps has been delegated to a special committee for report.

**London.**—Tenders are invited for a twelve months' supply of electrical stores for the War Office. Director of Army Contracts.

Telephone installation at the infirmary, Brook Street, Kennington. Lambeth Board of Guardians.

**Monmouth.**—Some hundred street gas lanterns are to be replaced by electric lamps.

**Ruislip-Northwood.**—Tenders are invited for the lighting and maintenance for street lamps for twelve months. Surveyor. March 30th. (See advertisement on another page.)

## TENDERS RECEIVED AND ACCEPTED

**Croydon.**—Messrs. Siemens Bros. Dynamo Works have received the annual contract for the supply of "Tantalum" traction lamps and "Wotan" drawn-wire lamps.

**Derby.**—An offer by Messrs. C. A. Parsons & Co., for a 2,000-kw. turbo-alternator at £7,017 has been accepted.

**Ipswich.**—The following tenders have been accepted:—Alternator, rotary-converter, automatic voltage regulator and switchgear, British Westinghouse Co., £2,212 13s. 3d.; three 50-kw. transformers and testing transformer, Ferranti, Ltd., £194; high- and low-tension switchgear for main power station and sub-stations, Voigt & Haefner (England), £1,992 16s.; two rotary-converters for Duke Street converter sub-station, British Westinghouse Co., £1,566; high- and low-tension underground cables, The Ateliers de Constructions Electrique du Nord et de l'Est (Agents, H. W. Butler & Co., London), £6,157 15s.; fused mains disconnecting boxes for four-core three-phase L.T. distributors, W. Lucy & Co., £196 (excluding fuses); services boxes, British Insulated & Helsby Cables, £40 4s.

**Liverpool.**—The Tramways Committee has placed an order with Dick, Kerr & Co. for motor equipments.

**London: Hackney.**—The Electricity Committee recommends the placing of a contract with Messrs. Willans & Robinson for a 5,000-kw. turbo-alternator with condensing plant and accessories at £13,500, and with Messrs. Ferranti, Ltd., for switchgear extensions at £374.

**Manchester.**—The following tenders have been accepted:—Two water-tube boilers, Babcock & Wilcox; water cooler, Lancashire Water Cooler Co.; balancing plant, Crompton & Co.; high- and low-tension switchgear, Edison & Swan United Electric Light Co.; high- and low-tension switchgear for sub-stations, British Westinghouse Co.; cable, British Insulated & Helsby Cables, Johnson & Phillips, Connolly Bros., Chas. Macintosh & Co., and Electrical Engineering & Equipment Co.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £65 15s. to £66 5s. (Last week, £66 10s. to £67.)

**Lantern Slides.**—Berry, Skinner & Co. (78 Upper Thames Street, E.C.) have prepared a series of lantern slides of their well-known switchgear, which they will be pleased to lend to engineers or lecturers.

**Removal.**—On and after the 7th inst. all communications to the Benjamin Electric, Ltd., should be sent to 1A Rosebery Avenue, E.C., where in future the Sales Office will be established. The new telephone number will be Holborn 1830.

FOR  
**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

## LOCAL NOTES

**Bognor: Gas Co. and Electricity.**—The Bognor Gas Co., which is now running its electric lighting department, reports a small loss of £185 10s. on the electrical undertaking for the first half year's working. At the meeting last week, however, the Chairman stated that the demand for electricity supply is gradually increasing, and that it was hoped before long that the Company would have just as big a success with electric cooking as it had hitherto with gas.

**Brentford: Gas Co. and Electric Supply.**—The Brentford Gas Co.'s Bill, which proposes to take powers to apply for electric lighting provisional orders, and also to take transfers of existing orders, has been before a House of Lords Committee, presided over by Lord Hylton, for the past week. There is considerable opposition to the electricity proposals, the opponents including the Metropolitan Electric Supply Co., the Hammersmith Borough Council, and the Barnes and Staines Councils. The point of the opposition, of course, is a possible competition with the existing electric lighting undertakings, whilst in the case of one or two councils whose districts are supplied with electricity by companies, their fear is that the Gas Co. may buy up the small local electric supply company, with detrimental effects upon the consumers of electricity in the matter of price, owing to the absence of competition. For the Gas Co. it has been pointed out that the Bill only gives power to apply to the Board of Trade for provisional orders, or for sanction to any transfers, and that at the usual inquiry held by the Board of Trade in any particular case, local authorities and all interested parties would be heard. In addition, it has been stated that the Gas Co. has no intention of asking for competing powers with any existing authority, and it is not improbable that some limiting words of this description will be embodied in the Bill, although at the moment of going to press the proceedings were some way from being finished.

**Darlington: Power Supply.**—The Borough Electrical Engineer has received an inquiry for a large supply of electricity from the North Eastern Railway Co. for power purposes.

**Dudley: Sale of Electricity Undertaking.**—Reference was made to the disposal of the electricity undertaking to a private company at the last meeting of the Council. It was pointed out that the company has to discharge the whole of the loans and interest upon them, to pay a further sum of £10,500, of which £3,500 is to be paid down, and the balance in seventeen instalments of £550, in addition to a sum of £3,334 unauthorised capital expenditure by the Council.

**Malvern: Bulk Supply.**—The Worcester Corporation recently placed a proposal before the Council, offering a supply of electricity in bulk in preference to the Malvern Council extending its power station, but the Electricity Committee states that it cannot entertain the proposal. The suggestion was for a twenty years' contract. After some discussion at the last meeting of the Council it was decided to adjourn the consideration of the matter for a month, and in the meantime to furnish the Council with copies of the offer from Worcester, and of the report from the Council's own Electrical Engineer on the proposed addition to the power station of a 150-kw. generating set at an estimated cost of £1,500.

**Manchester: New Power Station.**—The Electricity Committee has been unable to come to terms with the Manchester Ship Canal Co. with regard to the abstraction of water for condensing purposes at the new power station which it is proposed to erect on the Canal. A number of offers were made to the Canal Authorities which practically placed the whole control of the supply to be taken in their own hands, but no agreement could be arrived at, and presumably the Canal Co. will oppose the Bill which deals with this matter when it comes before Parliament.

**Swansea: Electricity Profits and Rates.**—In further reference to our note on page 124 of our issue for February 26th, the Electric Lighting Committee has recommended by four votes to three that no allocation to relief of rates should be made from the electricity profits from last year. The Electrical Engineer is opposed to any allocation, in view of large prospective capital expenditure upon the undertaking.

**Yorkshire: Power Co.'s Bill.**—The Yorkshire Electric Power Co.'s Bill, which proposed to take powers to supply electricity

in detail in all districts in its area where there is at present no supply of electricity given, and no statutory supply authority, has been rejected on standing orders on the ground that the Bill did not sufficiently describe the district in which the proposed supply was to be given. The Parliamentary notices regarding the Bill merely referred to the Company's area as a whole, and did not specify the particular districts in which such detailed supply would have been given. The Bill, therefore, cannot proceed this session.

## APPOINTMENTS AND PERSONAL NOTES

Mr. E. P. Barfield has resigned his position as Commercial Manager to the Edison & Swan United Electric Light Co.

Mr. W. J. Larke, Manager of the Power and Mining Department of the British Thomson-Houston Co. at Rugby, has been appointed to the Engineering and Manufacturing Departments to assist the Chief Engineer at Rugby.

The Marquis of Winchester (Chairman of the Victoria Falls & Transvaal Power Co.) and Sir D. Salomons, Bart., have been added to the Board of the City of London Electric Lighting Co. In financial circles these appointments are regarded with some significance in relation to the London Electric Supply Bill.

The Halifax Electricity Committee recommends that the salary of Mr. W. M. Rogerson, the Borough Electrical Engineer, should be increased from £600 to £700 per annum.

Mr. A. S. Barnard, Borough Electrical Engineer at Walsall, has resigned. A successor is to be advertised for at a salary of £500 per annum.

Mr. Edward C. Wallwork, who has been employed for some years at the Ashton Electricity Works, has been appointed assistant contract engineer to Callender's Cable & Construction Co.

Mr. Thomas R. Martin has resigned the position he has held for the past six years with the Metallic Seamless Tube Co., Ltd., and on the 30th inst. will join Messrs. J. H. Tucker & Co., of King's Road, Hay Mills, Birmingham, as their Sales Manager.

Mr. A. T. Young, who has hitherto been Manager of the London office of the British Electric Plant Co., Ltd. (78 St. Vincent Street, Glasgow), has been appointed General Manager.

Owing to the adoption of the forty-eight hour week at the Gillingham generating station, an additional Charge Engineer and Driver are required.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**W. T. Henley's Telegraph Works Co.**—The report and accounts given in our issue for February 19th were adopted at the meeting on Friday. The past year was recorded by the Managing Director (Mr. George Sutton) as the best which the Company had had, and records the number of orders, the quantity of material turned out, and the amount of sales. Satisfaction was expressed with the home trade, but the remarkable feature of the year had been the growth of the foreign trade, which had increased by leaps and bounds, with the exception of the submarine cable department. The Company was getting a fair share of the cable work in connection with the Post Office telephone extensions, whilst in the electric lighting department special attention was drawn to a large contract from the Shanghai Corporation, which, until recently, had bought its electrical materials elsewhere. The whole of the cables for the Central Argentine Railway Co. have now been delivered, and are in process of being laid. Another order of a similar character had come in from the Buenos Ayres Western Railway Co. of some £200,000 value.

**British Electric Transformer Co.**—The shareholders were congratulated at the meeting last week upon the fact that for the third year in succession a 10 per cent. dividend has been recommended. The satisfaction to be derived from this is announced by the fact that less than one half of the total profits are being distributed, and that considerable sums are being placed to reserves. The year 1914 has begun with an amount of orders far in excess of any previous year.

## SUMMARY

THE second reading of the London Electric Supply Bill is deferred until the end of the month. The scheme has been referred to in the Chairmen's speeches at several meetings of the London electric supply companies. (Page 156.)

MR. GEORGE WESTINGHOUSE died in America last week. (Page 157.)

THE "Cascade" induction motor has been developed so that three efficient speeds are possible with a simple type of winding. The motor has valuable inching qualities, and, besides being used for lifts, &c., has been used in two recent winding installations. (Page 157.)

WE give some particulars of the paralleling arrangements for the three large generating stations of the Commonwealth Edison Co. in Chicago. Reactors with a total reactive drop of 20 per cent. at their rated full load of 10,000 kw. are used. (Page 157.)

SOME interesting speeches were heard at the General Electric Co.'s 22nd Annual Dinner on Saturday. (Page 158.)

MR. H. E. O'BRIEN, in his Paper at last Thursday's meeting of the Institution of Electrical Engineers, considered how expenses might be saved by the use of lightened rolling stock on electric railways.—The

construction of a tramway sub-station is suggested in Manchester. (Page 158.)

A FINAL distribution of the assets of the National Telephone Co. is being made.—It is reported that the Nauven wireless station has communicated over a distance of 6,000 miles, and that successful experiments in wireless telephony have been made by Mr. Marconi. (Page 159.)

OUR "Electrical Engineering Literary Section" contains a list of new publications, reviews a number of technical books, and gives a selected list of recommended works on all branches of electrical engineering. (Page 167.)

THE reasons for the interlocking of the charge and discharge battery regulating switches in small lighting plants are discussed in our Questions and Answers columns. (Page 165.)

THE I.M.E.A. has agreed with the B.E.A.M.A. that at least three weeks should be allowed for the preparation of tenders for turbine plant. (Page 165.)

LAST week three Specifications describing details of Mr. E. Kilburn Scott's furnace for the fixation of nitrogen were published by the Patent Office. Others embraced incandescent lamps and wireless telegraphy. A Patent by Mr. Marconi, also relating to wireless, will expire during the week after a full life, as does another Patent by Mr. Wright and the Reason Manufacturing Co. for electrolytic mercury meters. Opposition to the grant of a patent to Mr. C. Trenzen for a process of obtaining ductile tungsten has been entered. We give also the results of other opposition cases in our "Patent Record." (Page 166.)

A NEW design of switchboard with front connections is illustrated in our "Trade Section," which also contains descriptions of a half-watt lamp fitting, an interlocked switch plug, some new cooking appliances, and accessories for conduit wiring. (Pages 167 to 170.)

TURBO-GENERATORS and rotary converters are required at Devonport; rotary converters are also required at Warrington; and cable at Southampton.—Local Government Board inquiries are to be held at Bacup (£1,000); Dublin (£77,000); and Virginia (Co. Cavan), £31,000. (Page 171.)

THERE is a strike at the glassworks at Lemington, at which the bulbs for Osram lamps are blown. The cause is the recent introduction of machines for opening and closing the moulds, by which some unskilled boy labour is displaced. (Page 171.)

THE Bill of the Brentford Gas Co. asking for powers to apply for electric lighting orders has been passed by the House of Lords Committee.—The Leeds Council has negatived a proposal of the Tramways Committee to purchase an electric car as an advertisement of electricity.—An unlimited supply of electricity at 6d. per week is to be given at Dover to workmen's dwellings.—Half-watt lamps are to be installed experimentally for street lighting in St. Pancras. (Page 172.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MARCH 19TH.

*Institution of Electrical Engineers.*

8 p.m. Discussion on Electric Battery Vehicles to be opened by F. Ayton.

FRIDAY, MARCH 20TH.

*Electro Harmonic Society.*

8 p.m. Last Smoking Concert of the Season. Holborn Restaurant.

SATURDAY, MARCH 21ST.

*Royal Institution.*

3 p.m. Afternoon Lecture IV.: "Recent Discoveries in Physical Science," by Prof. Sir J. J. Thomson, F.R.S.

TUESDAY, MARCH 24TH.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. At 207 Bath Street, Glasgow. Discussion on Electric Battery Vehicles to be opened by A. Page.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At the University, Liverpool. "Experiments on the Blast Cooling of Transformers," by F. J. Teagó.

*Institution of Civil Engineers.*

8 p.m. "Comparative Economics of Tramways and Rail-less Electric Traction," by T. G. Gribble.

WEDNESDAY, MARCH 25TH.

*Electrical Trades' Benevolent Institution.*

2.30 p.m. Annual Festival Dinner at Trocadero Restaurant.

THURSDAY, MARCH 26TH.

*Institution of Electrical Engineers.*

8 p.m. "Current-limiting Reactances on Large Power Systems," by K. M. Faye-Hansen and J. S. Peck.

**The London Electrical Engineers.**

Headquarters (46 Regency Street, S.W.) open Saturdays till noon.

*Rating Exam.* for all Cos. from 7 to 10 p.m. every Wednesday.

(TO-DAY) THURSDAY, MARCH 19TH, C. Co. FRIDAY, MARCH 20TH, D. Co. MONDAY, MARCH 23RD, A. Co. TUESDAY, MARCH 24TH, B. Co., Tech. Inst., 7 to 10 p.m. Min. Range Practice, 7 to 9 p.m.

WEDNESDAY, MARCH 25TH.—Recruits Infantry Drill, 7 to 8 p.m. Tech. Inst., 8 to 10 p.m.

**Finsbury Technical College O.S.A. Smoking Concert.**—A varied programme of both instrumental and vocal music has been arranged for the eighth annual smoking concert of the Finsbury Technical College Old Students' Association, to be held at the Waldorf Hotel on Friday, March 27th. Mr. Sydney A. Smith (66 Elystan Street, Chelsea, S.W.) intimates that he will be pleased to supply tickets, which must be obtained before the evening of the concert, at 1s. each.

## LONDON ELECTRIC SUPPLY

AT the annual meeting of the County of London Electric Supply Co., on Monday, on the motion of a shareholder, a resolution was passed adopting the scheme for dealing with London electric supply put forward by the bankers, Messrs. J. Henry Schroder & Co., Messrs. Morgan Grenfell & Co., and Messrs. W. Greenwell & Co. The Chairman, Mr. J. B. Braithwaite, explained the circumstances which had led up to the promotion of the Bill, and explained the Company's attitude towards the L.C.C. The financial details of the scheme were briefly as follows:—The existing preference shares to be exchanged on a 4½ per cent. basis for 5 per cent. debentures in the new Company, with a sinking fund behind them. The existing ordinary shares to be exchanged on a 5 per cent. basis for 6 per cent. preference shares, and, in addition, to receive a bonus of from 30 per cent. to 50 per cent. in ordinary shares of the new Company; for example, £10 ordinary shares receiving at present 10 per cent. dividend would receive in exchange £20 in 6 per cent. preference shares of the new Company, plus a bonus of £6 to £10 in ordinary shares. It was said that there would be an immediate increase of over 11 per cent. in the dividend on the existing preference shares, and 20 per cent. in the dividend on the existing ordinary shares, and, in addition, dividends on the new ordinary shares; and that the scheme provided compensation to directors and officials displaced.

The engineering side of the scheme had been in the hands of Dr. H. F. Parshall, who estimated that for the unification of London's electric supply on the lines contemplated £4,000,000 would ultimately be required, but it would be extended over a series of years. He regretted that the chairmen of the other companies, with three or four exceptions, did not seem to consider the scheme worth serious consideration.

Mr. Braithwaite also spoke on the scheme at some length at the meeting of the City of London Electric Lighting Co. last week, and expressed his regret that a majority of his colleagues on the board of that company had insisted on petitioning against the Bill.

The matter was referred to by Mr. H. R. Beeton at the meeting of the Brompton & Kensington Co., who said that the scheme had met with emphatic rejection by the directors, partly on the ground that the proposed amalgamation was on the basis of dividends and not on total profits. He further stated that the Joint Committee representing the London Companies were engaged upon the formulation of a unification scheme on co-operative lines, which should be more economical, and should be entitled to more favourable consideration by the L.C.C. Mr. W. R. Davies made a similar statement at the meeting of the Chelsea Electricity Supply Co.

The second reading of the London Electricity Supply Bill has been still further postponed until Monday, March 30th.

Another bite at last, but they are rather small fry. (See page 172.)

## OBITUARY

GEORGE WESTINGHOUSE.

**M**R. GEORGE WESTINGHOUSE, whose name is a household word in both electrical and railway circles, died on Thursday last in New York, at the age of sixty-seven. Although his presidency of the Westinghouse Electric & Manufacturing Co. terminated in 1910, there were many other branches of the undertakings connected with his name in which he played an active part to the end. There is no need to refer to the magnitude of the electrical and other businesses which he originated, for they are known all over the world. His name is even better known in connection with the compressed air brake, of which he was himself the inventor, and many stories are told of the initial difficulties which, like many inventors, he had to encounter before it could be introduced with success, although there have been few inventors whose ultimate success was so complete. It was in 1868 that he worked out the first applications of compressed air to railway brakes, patented in the following year, which also saw the foundations of the Westinghouse Air Brake Co. He was educated at the Union College, Schenectady, and had served in the United States Navy, and fought in the War of Secession as a volunteer. The son of a maker of agricultural machinery, of Schenectady, he was born at Central Bridge, Schoharie Country, N.Y., in 1846.

## THE "CASCADE" INDUCTION MOTOR

**T**HE development of the "Cascade" induction motor was treated of in a Paper by Mr. L. J. Hunt, read before the Manchester Section of the Institution of Electrical Engineers at a recent meeting. The cascade motor is essentially a low-speed machine, and it is when designed for speeds which are abnormal for single-field motors that it shows to best advantage. The numbers of poles for which the machine can be constructed are determined by the following conditions: The windings in the two fields must be mutually non-inductive, and when super-imposed must not produce an unbalanced radial pull on the rotor. These conditions are satisfied if the numbers of poles are in the ratio of 2:1. A single winding has been evolved satisfying these conditions. The rotor has to be provided with main and auxiliary windings, and the best results have been obtained when the numbers of turns on these are in the ratio of 1.73 to 1.00. The two windings are inter-connected, but no slip-rings are necessary for a one-speed machine. The one-speed motor closely resembles a machine of ordinary construction. The stator windings are identical in appearance, and only differ in the cross-connections of the coils. Standard construction is also used for the rotor. The stator winding does not allow of the production of any except the main field, unless the windings are acted upon by a field having a number of poles differing from those of the main field. Therefore, if a slip-ring rotor having the same number of poles as the stator be inserted in place of its own rotor, the machine will run as an ordinary one-field motor, but at a speed 50 per cent. in excess of that at which it will run with its own rotor. The iron loss will be less, and the copper losses slightly more than in a standard motor. A single rotor winding of the barrel type has been evolved, and any rotor of this type can be made to give an extra cascade speed by changing its cross-connections. Owing to the magnetising currents in the rotor windings, the cascade power-factor is high, and not, as is generally believed, low.

The pull-out torque of a two-speed motor is approximately the same at both speeds, but for fan driving and other cases where a smaller torque is required at the second speed, a switch may be provided, so that the stator windings may be in mesh at the higher, and at star at the lower, speed. This allows a smaller motor to be used, and keeps the power-factor high at both speeds. The single-speed cascade motor is useful for foundry cranes on account of its inching qualities, but two-speed motors are used for the longitudinal motion of travelling cranes in long shops. The application of these motors to the driving of winding engines and rolling mills is a development of recent date, and the results obtained at two installations in South Africa should be interesting, as there are two speeds at which rheostatic losses are absent. For a two-speed motor giving speeds in the ratio of 3:2, the efficiency during acceleration (constant torque) should be about 64 per cent., and with a one-speed machine about 50 per cent. An additional efficient running speed, in the ratio of 3:1, can, if necessary, be provided for by halving the number of main poles. Electric braking can then be obtained down to one-third full speed. The provision of this speed is

also useful on motors for lifts, &c. Experiments are being made with a view to developing a self-starting synchronous motor from the cascade motor by substituting direct-current for the induced stator currents, and starting the machine as an induction motor by resistances connected to the slip-rings. It is possible, also, that, by coupling a change-pole type of squirrel-cage motor in cascade with a two- or three-speed machine, a large number of speeds may be obtained.

## PARALLEL WORKING OF THE CHICAGO GENERATING STATIONS

**I**N order to ensure that the three large generating stations of the Commonwealth Edison Co. in Chicago shall have similar load curves and proportional outputs, the entire load is divided among them in accordance with a certain schedule from a central control station known as the load dispatcher's office. The load consists of a railway and a private and an industrial lighting and power load. Both D.C. and 60-cycle A.C. is supplied. By plotting the total demand against time it has been found that the total load exceeds three-fourths of its maximum value for but 150 hours during the year, while the energy output at about three-quarter load is only 0.3 of the total. During the last four years the load has exceeded half the maximum for less than 200 hours each year, and one-quarter of the maximum for about 5,300 hours. As the load is now quite diversified, no great change, according to the *Electrical World* (New York), is expected in future years. The peak load is now about 233,000 kw. The three generating stations are known as Fisk Street, Quarry Street and Northwest. The Quarry Street station feeds normally about 2,000 kw. into Fisk Street, while another 2,000 kw. is carried by the Northwest station, which connects with Fisk Street by lines, in the middle of which the sub-station load is tapped off. In addition, the Northwest station feeds other substations over direct lines. Between the hours of 5 and 6.30 p.m. only the Northwest station, according to schedule, feeds 4,000 kw. into Fisk Street. In case of trouble at one station or another, the load dispatcher issues instructions to the other stations to depart from schedule and to carry such additional load as conditions may require. Paralleling is done over system reactors at Fisk Street, having a total reactive drop of 20 per cent. at their rated full load of 10,000 kw. Normally the Fisk Street and Quarry Street stations are operated as an open ring, with the Quarry Street plant in the centre and the halves of Fisk Street at each end. The Northwest station is tied in with one of the two parts of Fisk Street, but without system reactors. However, when the number of units in operation at Fisk Street is seven or less, the open ring is closed at Fisk Street and opened when the number of units exceeds seven.

To prevent the reactors being short-circuited by section feeders for the various sections being brought together in a sub-station, coloured pegs are used to indicate on the load dispatcher's board the extent of each section. Red plugs are used wherever the lines from any two sections may be connected together after load conditions over the reactance are adjusted. If it is necessary to connect together two lines from the two sections of Fisk Street, the load dispatcher orders the load on both of the Fisk-Quarry tie-lines reduced to zero, or else orders the load equalised in the same direction. If switching is necessary between a line from Quarry Street and a line from either section of Fisk Street, the load on the tie-line connecting the Fisk Street section in question with Quarry Street must first be reduced to zero. After the necessary switching has been performed, schedule operation of the different generating stations is again resumed on order from the load dispatcher. When switching is to be done between two lines, the load dispatcher first obtains a reading of the lines' instruments. He then gives the order to connect the lines in question together. Except in very rare cases a change in load is observable, and this serves as a check that the order has been properly executed. The two lines are then separated at some other point, thereby completing the desired transfer of load from one line to another. If a load change on the two lines in question is not observed, it is an indication that the two lines have not been tied together, owing perhaps to some link being left out. This can be readily discovered on a check up.

Ordinarily the bulk of the high-pressure switching is done at night, but much also has to be done during the day owing to repairs, alterations, &c., as well as that due to the schedule. In this connection an elaborate protective system is used.

## THE GENERAL ELECTRIC DINNER

AT the twenty-second Annual Dinner of the General Electric Co., Ltd., last Saturday, at which about 700 were present, the Chairman, Mr. Hugo Hirst, delivered a most interesting speech. During the past two years, he said, the Company had shared in the wave of general prosperity; they had extended their works, added to their staff and workmen, and had been successful in raising their standard of value as well as their standard of living. A considerable sum had just been voted for the erection of very large club buildings, both for the work-people and staff. The Company had gone ahead considerably in the acquisition of rights to supply whole cities with light and power. They had also started, in conjunction with friends, cable works in Southampton, and were now, he believed, the only firm within the British Empire to manufacture "everything electrical." In continuation of the work of establishing themselves in the British Dominions overseas, a company had been established in Toronto, and 60 or 70 young men had been sent out there to preach the gospel of the three letters, G.E.C. The new London offices in Kingsway, which would be on a site of 26,000 sq. ft., and were being built as high as the L.C.C. would permit, were being designed with future requirements well in view, as the lease of the site was for 99 years; he could not prophesy any date for completion, as the present building strike might cause delay. The necessity of looking forward so many years induced Mr. Hirst to interesting speculations as to what the world would be like in twenty or thirty years' time, and also to the reflection that without electricity there would be no ideals of Empire. The telegraph, said Mr. Hirst, kept our thoughts, lives, emotions, and ideals running in parallel, and kept warm the feeling of kinship between successive generations. There would have been no 4th of July, 1776, with the meaning attached thereto, if there had then been a cable across the Atlantic. When telegraphy to the Colonies could be cheaper, when India and Australia were brought nearer to the Mother Country by an overland route to India, and communication all over the Empire accelerated and facilitated, one might arrive at the ideal of one Common Law, one Patent Law, one Trade Marks Act, and uniform coinage, weights, and measures throughout the whole Empire. Mr. Hirst concluded by proposing the toast of "Electrical Industries within the Empire."

Mr. L. S. Amery, M.P., who was the next speaker, wished that a better means could be found to discuss in Parliament matters affecting science and industry, and suggested that there should occasionally be a session in which matters should only be passed by a two-thirds majority.

The Hon. Sir John McCall, Agent-General for Tasmania, who also replied to the toast, said that in listening to Mr. Hirst he felt he was listening to a master of industry. He referred to the special facilities in Tasmania for developing the electrical industry. Launceston, he said, is the best-lighted city in the Southern Hemisphere, and even towns with a population under 2,000 had electric light. They were "harnessing" the power of the elevated lakes system, and Tasmania might eventually be one of the most important manufacturing states of the Australian Commonwealth. In this connection he referred to the Mount Lyell power scheme (see ELECTRICAL ENGINEERING of August 7th, 1913, p. 454). Mentioning more particularly the General Electric Co., he said that he was informed that over 10,000 hands were employed, and he congratulated the Company on paying regular dividends. If other firms were not so successful as this, the success of the G.E.Co., he said, was obviously due to the management and to the care of the employees. If the Company's policy were followed by everybody in this latter respect, there ought to be an end of labour unrest. The Company's carbon factory was of national importance, as without it we should have to buy carbons for our searchlights from abroad—and conceivably be dependent on a country with whom we might be at variance. He thought that the Company was doing a service to the Empire in establishing the subsidiary Companies in various parts of the Empire and supplying them with their products at manufacturing cost. Tasmania, he concluded, should be an example to other parts of the Empire, for he had instructions, when inviting tenders, to do so in all cases within the Empire.

Mr. M. J. Railing was the next speaker. In the course of his speech he attributed the migrating instinct of the sons of Great Britain not to a roving spirit, a love of adventure, the lure of the sea, or an ambition to accumulate wealth and land, but to the longing to "get on," to succeed, and to be leaders; it should, he said, be the object of every big undertaking such as theirs to perpetuate this longing.

Other speakers were Mr. W. Duddell, F.R.S. (President of the Institution of Electrical Engineers), Dr. Alexander Russell, Mr. L. G. Byng, the Hon. J. G. Jenkins, Mr. E. Manville, and Mr. A. J. Walter, K.C.

**The Electrical Trades' Benevolent Institution.**—We are requested to state that the Vice-Presidents at the annual festival dinner of the Institution, on Wednesday, March 25th, will be Mr. C. H. Wordingham, and Mr. Faithfull Begg.

## ELECTRIC TRACTION NOTES

Mr. H. E. O'Brien, in his Paper, at the Institution of Electrical Engineers last Thursday, on the Design of Rolling-Stock for Electric Railways, showed how important an influence on power consumption and other sources of expense was produced by the weight of the rolling-stock, especially where the acceleration was frequent and severe. In the case of multiple-unit coaches he put the saving in annual costs for each ton by which the weight was reduced at £12 5s. for current, £5 for rolling-stock repairs, and £1 for track repairs, or £18 5s. in all for motor-coaches and £14 5s. for trailers; or, taking into account interest and depreciation, £25 5 and £19 respectively, on the assumption that these things were proportional to the weight, it therefore paid to spend as much as £185 per motor-coach and £145 per trailer. In dealing with the various ways in which the weight might be kept down, he emphasised that the coaches should be made as wide as possible for best economy of weight in relation to seating capacity. Lightening the body-work permitted of lighter underframes, bogies, and motors. With regard to the roof, the elliptical design was lighter than the clerestory type, as well as being conducive to better lighting. The use of aluminium roof covering and panels could effect a saving of nearly half a ton per car over steel. Fixed seats were lighter than throw-over seats, and with regard to the floor, corrugated aluminium plates fitted in with a cork composition could be used. Nearly a ton could be saved by the use of the new high-tensile steels for underframes, and it was important that the weight of the control and other apparatus fixed to the frame should be evenly distributed. Lighter forms of brake pumps were now being introduced. On English roads the heavy equalising type of bogie was unnecessary. In his opinion the springs should be placed inside the frames, even at the cost of a little weight; but nearly 0.75 ton per coach could be saved by adopting spiral instead of elliptical bolster springs. Single brake-block equipment was in itself lighter than the double-block arrangement, but the strengthening of other parts entailed defeated this object. Motors were now ventilated instead of totally enclosed, and the lightness obtained by high motor speed was an economy in the end, even though it entailed higher cost of gear maintenance. Illustrations were given of details of coaches used on the Lancashire & Yorkshire Railway, and on the subject of heating, it was stated that the increase of load due to car heating could amount to 9 per cent.

The prevailing opinion expressed in the discussion was that Mr. O'Brien had over-estimated the saving in maintenance and other expenses, due to lightening of weight, and Mr. J. B. Sparks in particular pointed out that it was illogical to expect the maintenance cost to vary directly as the weight, but Mr. O'Brien announced that his assumption was based on experience on the Lancashire and Yorkshire Railway. Mr. Casson, of the District Railway, however, quoted cases of light rolling stock in London costing much more to maintain than heavier designs, and other makers agreed that a heavy coach was often cheaper to maintain than a lighter one. Again, as Mr. Mason (L. & N.W.R.) pointed out the advantages of lightness were often less than those obtained by the increased steadiness of running of a heavy vehicle. Mr. Bowden (Metropolitan Railway), however, reminded the meeting that it was mainly by the use of stronger material that Mr. O'Brien proposed to effect his lightening. Speaking more generally of bogie design, Mr. Burnett, who was steam locomotive superintendent to the Metropolitan Railway, said that motor bogies were not built sufficiently on locomotive lines, and he advocated longer wheel bases, larger wheels, and would like to see, if possible, the motors mounted on the underframes. Other speakers agreed that the tractive function of the motor bogie was often not sufficient, taken into account as to its design. There was also some discussion, in which Mr. H. W. Firth (G.E.R.) joined, on the relative merits of compartment and corridor cars, and the space to be allowed for seats, and criticisms and corrections of the author's curves were made by Mr. Casson, Mr. Carter, and others. Dr. S. P. Smith took the opportunity to put in a plea for field control of traction motors, which he said was facilitated by the use of interpoles.

In the course of a recent lecture on electric traction given in the large hall of London Bridge Station, Mr. P. Dawson (Consulting Electrical Engineer to the L.B. & S.C. Rly.) said that so far as the electrification of main-line railways was concerned, equal progress had been made in Europe and in America. About 2,000 miles of single track had been electrified in each case. He regarded as the most important electrification scheme so far carried out the New York, New Haven, and Hartford Railway.

The electrification of the Usui-Toge mountain railway (Japan) has been attended with most successful results, and is interesting on account of the use of direct-current at 650 volts, except at stations, where overhead contact lines with single catenary suspension are used. According to the *A.E.G. Journal*, the line, which is only about  $6\frac{1}{2}$  miles long and connects Karuizawa and Yokogawa, was constructed in 1893 as a single-gauge adhesion and steep-gradient line, with the Abt rack system. The adhesion sections have maximum gradients of 1 in 40, and the rack sections are throughout constructed on a gradient of 1 in 15. The through-trains between the east and west coasts of the island were hauled over this section by three-axle rack locomotives. The gauge is the Japanese standard of 3 ft. 6 in. One steam locomotive could manage up to six coaches. There are twenty-six tunnels on the route, and these comprise about 23 per cent. of the total length of the line. The work of electrification was started in 1910, and the twelve D.C. locomotives supplied by the A.E.G. were running in May, 1912. The journey time has been reduced from ninety to forty minutes. Energy is delivered from a generating station at Yokogawa, where three vertical 1,000-kw. Curtis turbines are installed. These drive 6,600 volt three-phase 60-cycle alternators, excited at 125 volts by two 75-kw. exciters. The 6,600-volt supply is taken to two substations through underground armoured cable, where it is transformed to 240 volts and then converted to 650 volts D.C. by four 450-kw. rotary-converters. A buffer battery consisting of 812 cells, having a capacity of 1,322 ampere-hours, in connection with a 100-kw. Pirani booster. The reason for the adoption of 650 volts D.C. as the traction current was that the tunnels would not admit of high-pressure overhead lines and at 650 volts it was just possible to secure satisfactory insulation. The current necessary made the use of a third rail imperative on the rack section. On the side tracks at the stations, however, a 100 sq. mm. overhead line is used. Current is collected from this through a trolley wheel. The line is fed by four insulated cables from each converter station fixed to wooden masts in the open and in insulators in the tunnels. The current is returned through the rails and negative feeders.

Some notes on the earlier electrical troubles experienced on the 11,000-volt single-phase equipment of the New York, Westchester & Boston Railway are given in the *Electric Railway Journal* (New York). Among the more important may be mentioned several cases of the main transformers, situated under the motor-cars, burning out. This was found to be due to too much air being circulated by the ventilating fans, with the result that on damp days moisture was drawn in, and, as the transformers ran too cool, the insulation was spoilt. The trouble has been overcome by fitting baffle-plates between the fans and transformers, with openings in the bottom of the casings so that water can be drained out. The speed of the fans was also reduced. Trouble was also experienced owing to the repulsive action between the cables connecting the transformers with the switches, as these were not sufficiently well anchored. Owing to surges, it has been necessary to fuse all the circuits much higher than was originally done. The main high-pressure circuit-breakers are set to open at 200 amperes, although the normal starting current is 65 amperes. The motors and auto-transformers were earthed to the underframe of the car, but the current dealt with was too big. On new cars the earth cable from the motors is to be taken to the auto-transformer winding. One case of the high-pressure cables earthing to the conduit has occurred. Earths have occurred by birds alighting on the roof, while the pantograph was held down by a low contact line at a bridge. No trouble has been experienced with the motors. It was found necessary to turn and slot the commutators about once a year, or after running 50,000 miles. Four armatures have burnt out: three due to overwork and excessive external heat and one due to an earthed commutator bar. Test made on six cars after they had been in service for five hours with the outside air at 24° C., showed average temperatures of 69° C. for the armatures, 55° C. for the fields, 82° C. for the commutators, 39° C. for the motor casing, and 49° C. for the transformer core. The switch contacts have been found to last about one year. Owing to the intermittent torque it has been found necessary to heat the motor pinions to 800° F., and then to hammer them lightly in place. As both motors were connected permanently in parallel, it was found that the cars could not be pushed in the yards by shunting locomotives at speeds above 4 m.p.h. A separate switch for each motor is to be installed in the control circuit instead of the present arrangement of one, which controls both motors at the same time.

It is anticipated by a correspondent in the *Manchester*

*Guardian* that the forthcoming report by Mr. McElroy (General Manager, Manchester Tramways) on the congestion of traffic in Manchester will probably suggest that a tramway subway, just under the roadway, be built in the central part of the city. The subway would run between the rivers Irwell and Medlock via Blackfriars Street, Market Street, Piccadilly, and London Road. This would diminish the present delays at the Deansgate, Cross Street, High Street, Mosley Street, and other crossings.

The Hove Corporation has now decided that, until the overrunning system of trolley omnibuses has been tried by the Brighton Corporation, it cannot see its way to agree to arbitration. In reply, the Brighton Corporation has pointed out the underrunning system, as adopted by itself, is the only one suitable for the authorised through-routes between Brighton and Hove, owing to the necessity of crossing several tramway tracks. As stated in our last issue, the Brighton authorities wish for an arbitrator to determine what system be adopted.

Ozonising apparatus is being installed in connection with the ventilation of the Charing Cross, Euston & Hampstead, and the Baker Street & Waterloo Tube Railways, at Edgware Road, Euston, Goodge Street, and Charing Cross.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The liquidator of the National Telephone Co., Mr. G. Franklin, has announced that the final distribution of assets, amounting to 148 per cent., or 8½d. in the £, will be made on Wednesday next. The total distribution on the deferred stock is thus brought up to 105·48 per cent. The debenture stocks, first, second, and third preference shares, were paid off at par, and the preferred stock at 105 per cent.

The twenty-fifth anniversary of the filing of the first Strowger patent for automatic telephones was on March 12th, says *Telephony* (Chicago). The inventor, Mr. A. B. Strowger, claimed in this American patent the following:—"In a system of telephone, telegraph, or other electrical exchange, the combination with a series of wires leading to different stations in the system, and having their ends insulated and held in a curved row, of a contact needle supported at the axis of the rows, mechanism for moving the needle from row to row, mechanism for moving the needle along the row, magnets for actuating said mechanisms and wires leading from a sub-station for conducting electricity to energise the said magnets."

A short Paper by Mr. W. Judd, describing the Gulstad vibrating relay, has been accepted by the Council of the Institution of Electrical Engineers, and has appeared in the *Journal*. The relay is applicable to double-current Morse signalling, and is largely used by the Great Northern Telegraph Co. of Copenhagen, and by other telegraph companies to a small extent.

It is stated that the wireless station at Nauen has exchanged clear messages with the Windhuk station in German South West Africa, a distance of about 6,000 miles.

It is reported that successful tests have just been made with a new wireless telephone between Italian warships by Mr. Marconi.

Meetings of the creditors and shareholders of the Grindell-Matthews Wireless Telephone Syndicate, Ltd. (in liquidation), were held on March 10th, at which it was stated that reconstruction negotiations were in progress by which it was hoped to pay off in full the debts, which amounted to £6,000. The Syndicate had a station at Letchworth, and one at Northampton, between which satisfactory communication could be maintained.

A profit of £24,166 is reported on the year's working of the Automatic Telephone Manufacturing Co.

The cable between Perim and Djibouti was repaired on March 10th, and the Persian lines were down on the 12th inst. between Borazjoon Ahvaz.—All telegrams to S. Domingo are being sent by wireless via Pence, Puerto Rico.—Owing to storms there was probable delay to France, Switzerland, and Italy, the cable and landlines being down.—

**Threatened Wiremen's Strike.**—A meeting of the Electrical Trades' Union last Thursday discussed until nearly midnight the card of rules issued by the London Electrical Masters' Association (published in our issue of last week), and it was decided to defer any action until after the meeting of the Union representatives with the masters, which is to take place to-day.

## "ELECTRICAL ENGINEERING" LITERARY SECTION

### NEW PUBLICATIONS

- "A Handbook of Wireless Telegraphy," by J. Erskine-Murray. 442 pp. 8½ in. by 5½ in. 208 figures. (London: Crosby Lockwood & Son.) Fifth edition. 10s. 6d. net; abroad, 11s. 2d.
- "Incandescent Electric Lamps and their Application," by D. H. Ogley. 107 pp. 7½ in. by 5 in. 59 figures. (Longmans, Green & Co.) 2s. 6d. net; by post, 2s. 9d.
- "Practical Uses of the Wave Meter in Wireless Telegraphy," by J. O. Mauborgne. 74 pp. 9½ in. by 6 in. 42 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 4s. 2d. net.
- "Handbook of Electrical Methods." Compiled from the *Electrical World*. 25 pp. 9½ in. by 6½ in. 386 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 12s. 6d. net.
- "American Electricians' Handbook," by T. Croft. 711 pp. 7 in. by 4½ in. 792 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 12s. 6d. net.
- "Die Profilgestaltung der Untergrundbahnen." Eine Bautechnisch-Wirtschaftliche Studie. By A. Macholl. 129 pp. 9½ in. by 6½ in. 44 figures. (Munich: R. Oldenbourg.) 4s. 6d. net; by post, 4s. 11d.
- "The Dignity of Business: Thoughts and Theories on Business and Training for Business," by H. E. Morgan. 260 pp. 7½ in. by 5 in. (London: Ewart, Seymour & Co., Ltd.) 2s. 6d. net; by post, 2s. 9d.

- "The Elements of Electricity," by W. Robinson. 596 pp. 9½ in. by 6 in. 374 figures. (New York: John Wiley & Sons; London: Chapman & Hall, Ltd.) 10s. 6d. net; abroad, 11s. 6d.

### REVIEWS OF BOOKS

**Die elektrischen Metallfadenglühlampen insbesondere aus Osmium, Tantal, Zirkon und Wolfram. Ihre Herstellung, Berechnung und Prüfung.** By C. H. Weber. 453 pp. 9 in. by 6 in. 216 figures. (Leipzig: Dr. Max Jänecke.) 16s. net; by post in United Kingdom, 16s. 6d.; abroad, 17s.

This book is a development of the author's publication on carbon filaments and carbon filament lamps. It deals exclusively with the manufacture of metallic filament lamps. The author has devoted himself minutely to collecting accurate references, particularly from patent literature, without, however, discriminating between the practicability of the different processes described. Nevertheless, the book will prove useful to the technical student interested in this industry, because it contains a great deal of information regarding some practical processes, which has not been published before. As a compendium for the lampmaker it will form a convenient and useful book of reference of a historical kind, though it gives little help towards proper appreciation of modern commercial developments; in other words, the author appears to accept the statements made in the different patent specifications as giving the true facts as regards the various processes proposed from time to time.

After discussing the early proposals for lamp manufacture, of which the platinum lamp was the only typical commercial lamp of the time, until it was superseded by the lamp having a cheaper filament of carbon, the author gives a great deal of information as regards the osmium lamp, the zircon (carbide) lamp, and the tantalum lamp. Carbon filaments having a coating or addition of metal are then summarised, and finally lamps with filaments of metals, or metal carbides, nitrides, or hydrides, or mixtures of these with the metals, are referred to.

The remaining three-quarters of the book is devoted to the tungsten filament lamp, and admirably illustrated descriptions of the various processes used in the manufacture of the squirted tungsten filament lamps are given, showing the intimate knowledge of the author with actual lamp manufacture. The author states in the preface that the description of the drawn tungsten wire filament lamp, the latest technical achievement, which is now the type most largely used, and the methods for obtaining the drawn tungsten wire, are withheld for a future edition. Meanwhile, Mr. Weber's book, now published, offers so much of interest that the perusal of it can be highly recommended.

**Electro-Thermal Methods of Iron and Steel Production.** By J. B. C. Kershaw. With an Introduction by J. A. Fleming, F.R.S. 239 pp. 9 in. by 5½ in. 92 figures. 50 tables. (London: Constable & Co., Ltd.) 8s. 6d. net; abroad, 9s. 1d.

There is much useful information in this work which distinguishes it from those preceding it. The author collected as much information as was available in 1907 and incorporated it in a handbook published at that date. The great extensions which have taken place since then have been carefully followed, and official information as to the working of all the plants in existence has been obtained, as far as possible, and has been presented so that the actual results, in some cases taken over extended periods, of the different installations are easily comparable. A general sketch of the scientific principles of electric heating is given, together with the broad lines of furnace design in so far as these relate to the smelting or refining of iron and steel. We are pleased to see, however, that the bulk of the space is given over to full descriptions of actual installations and methods of operation. One is able to follow how, of the later designs of furnace, some have survived and some, which have not proved themselves better than their progenitors, have either not entered or else have soon disappeared from the industrial conflict. There are already several steelworks in this country where electric furnaces are used, especially in the manufacture of high-grade tool steel, and the number shows every sign of being on the increase, though there is little likelihood of any radical changes being made in

the methods of pig-iron production for some time to come. Besides the working costs given, lists of the different types of furnaces in use in different parts of the world are included, as well as lists of English and foreign patents relating to electric furnaces for iron and steel production, and relating to each particular type of furnace. The matter is conveniently put together, and should prove useful both to practical steel-makers, students, and experimenters.

**Electrical Engineering.** By C. V. Christie. 417 pp. 9½ in. by 6½ in. 378 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 17s. net.

Mr. C. V. Christie, who is Assistant Professor of Electrical Engineering at the McGill University, Montreal, may be said to have produced a book of considerable value to students of electrical engineering. The range covered is wide, as the subjects include electrostatics, magnetism and electromagnetics, electric circuits, direct-current machinery, all kinds of alternating-current machinery, converters and transmission lines. Although it does not purport to be a treatise on design, the actions taking place in the various parts of the machinery treated are clearly and accurately set forth, while the dependence of one action on another is well illustrated, so that by studying the analytical and graphical methods of dealing with the many problems which arise in this part of a large subject, the reader is enabled to form a concise idea of the correct proportioning of different parts of machinery to obtain the best results. The effect of departures from existing practice in the design and operation of electrical machinery may also be readily gleaned. The space devoted to alternating-current commutator motors is not large, but gives excellent preparatory reading for a study of the more highly specialised books dealing with these motors, as it is sometimes difficult to follow their behaviour from these unless something is previously known of their construction and design. Transformers and induction motors are treated at greater length, while the section on converters, including the mercury rectifier, should prove very useful. The section on transmission lines is devoted chiefly to a mathematical treatment of high pressure lines, but nothing is given which is not of use. A small point may be made of the fact that in a few places, especially in the latter section, the explanations of the symbols used in the equations are not complete; for instance, in one place we read: "where  $D$  is the distance between the conductors and  $R$  is the radius of the conductors." The units are not stated, and cannot be inferred from the particular context. From a theoretical point of view, too, it may be said that the laws of magnetism are given too vaguely, as the influence of the medium in which the magnetic bodies are situated should be introduced right at the beginning. The equivalent problem of the electric field is most ably treated, as is every other part of the book.

**Text-Book of Physics.** By J. H. Poynting, F.R.S., and Sir J. J. Thomson, F.R.S. Electricity and Magnetism: Parts I. and II., Static Electricity and Magnetism. 345 pp. 9½ in. by 6½ in. 246 figures. (London: Charles Griffin & Co., Ltd.) 10s. 6d.; abroad, 11s. 1d.

This is the fourth of a series of volumes by the same authors, forming a complete text-book of physics, and contains Parts I. and II. of the section devoted to electricity and magnetism. Part I. treats of static electricity and Part II. of magnetism, while the phenomena of electric currents, electro-magnetism, and the states of change of electrical systems generally, are reserved for a volume yet to make its appearance. The names of the eminent authors are a sufficient guarantee that the treatment represents up-to-date views, although there is naturally less with regard to which fundamental ideas have changed in the subjects of this volume than there will be in the next. As the authors comfortably put it: "The view of electric action taken by Faraday and largely developed by Maxwell still holds good. . . . The electron theory is, substantially, a more highly developed and dynamical form of Faraday's theory." Electrons, however, come little into the scope of the present volume. The treatment is not deeply mathematical, but aims in its reasoned description of all the inter-connected phenomena to establish firmly in the student's mind the foundation on which the mathematic theory may be built up. Excellent as is the first part, with its well-balanced, logical sequence, and the clearness of such passages as that describing the physical nature of electric strain, many readers will be more attracted by the section on magnetism. This

opens with a masterly "general account of magnetic action," makes us enthusiastic over the beauty of Ewing's molecular theory, and brings together and points out the meaning of many recent scattered researches in the properties of paramagnetic and diamagnetic, as well as ferromagnetic bodies. There is also a chapter on terrestrial magnetism, and the important Zeeman and other interactions of magnetism and light are discussed in the concluding pages.

**The Elementary Principles of Illumination and Artificial Lighting.** By A. Blok. 248 pp. 7½ in. by 4½ in. 126 figures. (London: Scott, Greenwood & Son.) 3s. 6d. net; abroad, 8s. 10d.

The author deals equally with all sources of artificial illumination, and condenses into a small volume an extensive survey of the general principles of illumination. After notes on the nature of light and its production, the units by which it is measured, and the standards to which these are referred, he plunges into practical calculations, and indicates methods by which the illumination produced by given sources in given circumstances may be calculated. In the earlier part, perhaps, it is not quite enough insisted upon that the law of inverse squares does not always hold good when part of the light, as is more often the case than not, comes from reflectors, and some of the calculations which the reader might deduce from polar curves would possibly give inaccurate results from this cause, despite the rather inconspicuous warning in the chapter on reflectors, globes, and shades. He develops also, however, useful methods of calculation in terms of total flux of light (lumens), which are probably free from this objection. There is a wealth of quantitative material of a thoroughly practical nature in the latter part of the book which should be of great help to those planning actual installations, and notes and data both on interior lighting and street lighting are excellent.

**T.S.F. La Télégraphie sans Fil. La Téléphonie sans Fil. Applications Diverses.** By G. E. Petit and L. Bouthillon. 243 pp. 10 in. by 6½ in. 185 figures. (Paris: Librairie Ch. Delagrave.) 7s. 6d. net; by post, 7s. 11d.

The authors have had in mind to show what progress has been made in the art of signalling through space without wires during the last fifteen years, to state the position at the present time, and to indicate that finality in design or achievement has not yet been reached. To this end the book is divided into two parts. The first part deals with the theory and connections of apparatus, as well as with concise descriptions of almost every piece of apparatus used in modern systems of wireless telegraphy. The second part is devoted more to a consideration of long-distance transmission, and although some information of an historical nature is given, by far the greater space is devoted to a description of modern stations and their achievements. Particulars of the time signals and weather reports sent out from the Eiffel Tower are given, and the International Convention agreed to in London on July 5th, 1912, is published, we believe, for the first time, in full. This occupies some sixty-four pages, and forms an important appendix. Another appendix is devoted to an investigation into the problem of radiation from different kinds of aërials, and directive aërials. As would be expected from the pen of MM. Petit and Bouthillon, the subject is adequately treated, and gives most interesting reading.

**Practical Uses of the Wave Meter in Wireless Telegraphy.**

By J. O. Mauborgne. 74 pp. 9½ in. by 6 in. 42 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 4s. 2d. net.

The scope of this book cannot be better expressed than by quoting the following from the Preface:—"In its original form this work was first privately printed for reference use at the Army Signal School, Fort Leavenworth, Kansas, and, in 1912, was, by direction of the Secretary of War, adopted for use at that School . . . and in its present form is now published for commercial and technical-school use." As one would expect in such a treatise, no matter of purely academic interest is included, but there is a quantity of theoretical and practical information as to wave meters in general, and their uses, especially as regards tuning the sending station, measurement of damping, and logarithmic decrement, and measurement of the wave-length of the receiving station. A valuable chapter on the measurement of the capacity and inductance of the different parts of wireless installations is also given. Included are concise instructions for the determination of coefficients of self-inductance, mutual inductance, and coupling. Instructions are given for the

CONSTABLE & CO., LTD., LONDON,  
10, Orange Street, W.C.

use of a logarithmic chart for the calculation of frequency, wave-length, inductance, and capacity of oscillatory circuits, so that the necessity for more or less lengthy calculations, which are also fully shown, is avoided. Although, perhaps, it deals with some apparatus not much used in this country, yet similar principles apply to all—there is matter not before so conveniently put in print, which makes the publication of value to operators who wish to understand fully the many uses of a wave meter, and to experimenters.

**Incandescent Electric Lamps and their Application.** By D. H. Ogley. 107 pp. 7½ in. by 5 in. 59 figures. (London: Longmans, Green & Co.) 2s. 6d. net; by post, 2s. 9d.

The greater part of this book deals with illumination in general, and the general principles of the production and transmission of light and of photometry are clearly explained in the first five chapters, which form nearly half of the book. A rather brief sketch of the history of the incandescent lamp follows, up to and including the tungsten drawn-wire filament, but unfortunately the book has gone to press too early for treatment to be included of the half-watt lamp, which is likely to have so important an influence on incandescent electric lighting. Another chapter gives an interesting series of curves of life-tests, candle-power, and voltage relations, and so forth. The physiological aspect of the question is then taken up, and the effect of light on the eye is studied. We then come to the practical side of the subject, or, as it is now the fashion to call it, illuminating engineering; and the remaining third of the book discusses the direct, indirect, and semi-indirect systems. In our opinion these sections are not quite up to the standard of the first portion. It is true there are copious illustrations of commercial patterns of shades and reflectors, and a good idea is given of the distribution of light obtained by their use. Views of installations are also included; but there is rather a lack of quantitative information, such as would be required in planning an actual case. This is particularly so in the section on indirect lighting, which reads a little like an advertisement, and does not give sufficient data to enable one to determine what sizes of lamps are desirable in order to study the subject from the economic point of view; nor is it satisfactorily explained how to estimate the illumination produced either on the ceiling or the working plane. There is, however, a chapter at the end entitled "Further Illumination Calculations," but this is not in a very practical form; also, it relates, as far as we can see, only to direct lighting. The subject of street lighting by incandescent lamps does not fall within the range of the book. In short, we think that the first portion could have been somewhat compressed without losing any of its clearness of enunciation of first principles, while in the latter part quantitative examples and practical methods of calculation, or where these are impossible, empirical rules drawn from practice, might have occupied a larger proportion of the space.

**American Electricians' Handbook.** By T. Croft. 711 pp. 7 in. by 4½ in. 792 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 12s. 6d. net.

This is a thoroughly practical handbook in that the proportion of really practical hints to the more academic side of the subject is larger than is usual in publications of the pocket-book class. In some ways the work relates more to American practice than to conditions prevailing over here, and British readers will find the use of the circular mil in the wire tables a handicap. Nevertheless, a very large proportion is of universal application. The largest section is devoted to interior wiring, and contains many practical hints not usually found in print; and the section on illumination, while concise, is full of good quantitative data. The generator and motor section is, as it should be, addressed to the user rather than to the designer and manufacturer, and there is a mass of well-chosen miscellaneous electrical information. It should be mentioned that telephone and bell wiring is dealt with as well as electric light wiring, but that neither electric traction nor high-tension transmission are included. The work is not addressed to engineers planning great schemes, but is intended to be a help to a larger class of electrical workers in their everyday work.

**A Handbook of Wireless Telegraphy.** By J. Erskine-Murray. 442 pp. 8½ in. by 5½ in. 208 figures. (London: Crosby Lockwood & Sons.) Fifth edition. 10s. 6d. net; abroad, 11s. 2d.

It is only a few months ago that we welcomed a fourth

edition of Dr. Erskine-Murray's book on wireless telegraphy, and the appearance of a fifth edition so soon is a guarantee that the work has merits that are appreciated. The author has, however, been able to make a certain amount of revision, principally in matters of detail, and the new additions relate chiefly to the uniform alternating-current and shock-excitation systems. Recent measurements of transmitted power are also included. The book throughout is written in an interesting and readable style, and displays considerable originality in expounding the author's points of view, which enables the reader to obtain a very clear grasp of the physical nature of wireless telegraph phenomena.

**Wireless Telegraphy: A Handbook for the Use of Operators and Students.** By W. H. Marchant. 241 pp. 7½ in. by 5½ in. 154 figures. (London: Whittaker & Co.) 5s. net; abroad, 5s. 4d.

The first few pages of this book are not so good as the later ones, owing, no doubt, to the author's endeavour not to devote too much space in explanations of electrical and magnetic phenomena. As a result of this policy, there is a tendency to cite special cases as general, and in several places the accuracy of statement has suffered through undue compression. The descriptions of the action of different pieces of apparatus is not always clear on first reading. On the other hand, the author has held the balance between the chief systems in use in this country and on the Continent, and has included good representative examples, with well-drawn diagrams and illustrations of special apparatus. Some space is devoted to portable installations, and there is much of use to operators on the care and testing of their apparatus. At the end are some abstracts from the Official Regulations, and instructions for both ship and shore stations. There has been no attempt to go into details of construction, but there is sufficient technical matter to enable students with some knowledge of electrical science to sit successfully for the Post Office examination for wireless telegraphists.

**Handbook of Electrical Methods.** Compiled from the *Electrical World*. 285 pp. 9½ in. by 6½ in. 386 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 12s. 6d. net.

The contents of this book consist entirely of extracts from the *Electrical World* (New York) on those subjects which relate, to use the words of the preface, "purely to ways of doing things rather than to design, descriptions of apparatus, or to the commercial side of the electrical industry." The articles are conveniently classified and arranged, and a great deal of practical detailed information is included which is not of a nature usually incorporated in text-books. A certain proportion relates more to American than to British conditions; but there is a good deal of universal application. The range of subjects includes overhead lines, meters, switchgear, and connections, electric lighting and signs, transformers, interior wiring, motors, motor-generators, &c.

**Electrical Engineering Problems: Part I., Direct-Current Circuits and Apparatus; Part II., Alternating Current Circuits and Apparatus.** By F. C. Caldwell. 105 pp. 9½ in. by 6 in. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 4s. 2d. net.

The questions are graded as regards difficulty and subject, and would be suitable for second and third year electrical engineering students in our technical colleges, except that B. and S. wire gauge is used, and resistivity is given per mil-foot. There are 222 questions relating to D.C. circuits and machinery, and 390 relating to A.C. circuits and machinery. A guide to the real difficulty of each question is given by a suggested time necessary for solution after each. The relative values are about correct, but the actual times given are much too low. Sheets giving the answers to the problems may be obtained by instructors only. Generally speaking, however, our instructors can devise and work out suitable problems themselves.

**Problems in Alternating-Current Machinery.** By W. V. Lyon. 136 pp. 9½ in. by 6 in. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 6s. 3d. net.

Some of these problems are suitable for more advanced students than the book reviewed above; otherwise the same criticism applies, except that the question of wire gauge does not enter in, and times for solution are not given. There

are ninety-eight problems relating to transformer design and working, 149 to synchronous machines, eighty to induction motors, sixty-one to rotary converters, seventy-five to polyphase circuits, and forty-four to non-sinusoidal waves. All are useful and many have been taken from practice. The answers will not be obtainable until the end of the year.

**Answers to Problems in Essentials of Electricity for Wiremen and the Electrical Trades.** By W. H. Timbie. 11 pp. 7 in. by 4½ in. 2 figures. (New York: John Wiley & Sons; London: Chapman & Hall, Ltd.) 1s. net.; by post, 1s. 1d.

These answers apply to problems set in Mr. Timbie's book, "Essentials of Electricity," reviewed in ELECTRICAL ENGINEERING for March 13th, 1913, p. 147, Vol. IX.

**Leitfaden der drahtlosen Telegraphie für die Luftfahrt.** By M. Dieckmann. 214 pp. 8½ in. by 6 in. 150 figures. (Munich: R. Oldenbourg.) 8s. net.; by post 8s. 6d.

The provision of wireless telegraph equipment for aerial craft introduces special problems and difficulties which do not arise with land stations. Not only is the weight of the apparatus an important consideration, but the absence of an available earthing point requires aerials of an entirely different design to be used. So far, information on these points has been somewhat scattered, and the increasing number of those interested in the subject will welcome a book specialising in this branch of wireless telegraphy. We would have wished, however, that the author had limited himself a little more to this specialised part of the subject, instead of wasting much of the earlier part of the book in the exposition of elementary principles. Those ignorant of the general principles will not require a book specialising on the aeronautical branch, while those taking up that class of work will have already had a general training in wireless telegraphy. We do not say that these first principles and their adaptation to the propagation of waves are not well handled, but we would rather have had more details of the actual methods and apparatus employed, and experience with their use. The second or practical section of the book is of great interest, especially that part relating to the arrangement of the antennae on aeroplanes and airships, and the methods adopted for ascertaining the bearings and locality of airships, a subject which has received a great deal of attention in Germany. As, however, so much space had been used up in the earlier part of the book for elementary matters, the treatment is disappointingly brief.

**Inventors and Patentees Year Book for 1914.** By W. H. TAYLOR. 739 pp. 7½ in. by 5½ in. (Manchester: Dexter Press, Ltd.) 7s. 6d. net.; abroad, 8s. 4d.

This, the first issue of the first year book devoted to patents questions, contains a quantity of information, both interesting and useful. Inventors and patentees could not fail, by a perusal of its contents, to obtain an insight into the working of the patent system of Great Britain, as well as the procedure to be adopted to obtain patents under varying conditions in other countries in and outside the National Convention. The approximate costs of obtaining foreign patents are also given, together with the actual fees payable to the respective governments, and the amount of protection obtainable. By far the larger proportion of the book is devoted to an exposition of the Patents and Designs Act, 1907, and Patent Office procedure. Lists of the publications issued by the Patent Office are given, and the names of those, together with the places where they may be seen in the different towns are stated. Considerable space is devoted to the question of foreign and colonial patents—the information given is of a useful character. The International Convention, as amended at Washington in 1913, is given in full, and a section is devoted to a discussion of the "relative inventiveness in Great Britain, United States, Germany, and France." One cannot quarrel with statistics, but what they show is a matter of opinion, and as some of the conclusions arrived at do not agree with the preceding statements, we would advise the author to revise carefully this section in the issue for next year.

**The Universal Electrical Directory.** (J. A. Berly's), 1914. 1,550 pp. 9½ in. by 6½ in. (London: H. Alabaster, Gatehouse & Co.) 21s. British and Colonial Sections only, 12s.

The contents of this directory are again divided into four sections, viz., the British, which contains some 14,000 names; Colonial and General, with 7,000 names; Continental, with 7,500 names; and U.S.A., with some 5,750 names. Each division is sub-divided into alphabetical and classified sections, whilst in the case of the British the geographical section, which has been found of immense utility, has been retained. Further facility of reference is afforded by means of a thumb index. The directory is not only a directory of names, but contains full details of all the electricity undertakings in the United Kingdom, and all the important ones in the British Colonies, and some other countries.

## Messrs. Longmans & Co.'s List

SECOND EDITION, Revised and Extended (1911). With 7 Plates and numerous other Illustrations. 8vo. 28s. net.

**THE PRINCIPLES OF ELECTRIC WAVE TELEGRAPHY AND TELEPHONY.** By J. A. FLEMING, M.A., D.Sc., F.R.S., Pender Professor of Electrical Engineering in the University of London, &c.

"There is no doubt that this book should be regarded as the standard work on the subject."—*Electrical Engineering*.

BY THE SAME AUTHOR. With 187 Illustrations. 8vo. 7s. 6d. net.

**AN ELEMENTARY MANUAL OF RADIOTELEGRAPHY AND RADIOTELEPHONY FOR STUDENTS AND OPERATORS.**

**POWER HOUSE DESIGN.** By JOHN F. C. SNELL, M.Inst. C.E., Vice-President of the Institution of Electrical Engineers, &c. With 17 Folding Plates and 186 Illustrations. 8vo. 21s. net.

**INSULATION AND DESIGN OF ELECTRICAL WINDINGS.** By A. P. M. FLEMING, M.I.E.E., and R. JOHNSON, A.M.I.E.E. With Diagrams. Medium 8vo. 7s. 6d. net. "The field to be dealt with is sharply defined—an advantage as considerable as it is rare—and the authors appear to have covered this field very completely."—*Machinery*.

THIRD EDITION. With 376 Illustrations and Diagrams. 8vo. 10s. 6d. net.

**ELEMENTARY TREATISE ON ELECTRICITY AND MAGNETISM.** By G. CAREY FOSTER, F.R.S., Fellow of and Emeritus Professor of Physics in University College, London; and ALFRED W. PORTER, B.Sc., Fellow of and Assistant Professor of Physics in University College, London. Founded on Joubert's "Traite Elementaire d'Electricite."

**ELECTRICITY AND MAGNETISM.** By S. G. STARLING, B.Sc., A.R.C.Sc., Head of the Physical Department in the West Ham Municipal Technical Institute. With Diagrams. Crown 8vo. 7s. 6d. net.

**A PRIMER ON ALTERNATING CURRENTS.** By W. G. RHODES, D.Sc., Head of the Electrical Engineering Department. The Royal Technical Institute, Salford. With Diagrams. Crown 8vo. 2s. 6d. net.

LONGMANS, GREEN & CO., 39, PATERNOSTER ROW, LONDON, E.C.

## Have you seen this ? month's Journal

### What it is not.

It is not a journal for old ladies. It gives no "local news" and no gossip.

It is not a journal for the chronic "out-of-work." It gives no information about "jobs vacant" and the salaries they carry.

It does not live by its wits, taking an advertiser's money with one hand and writing anything he may want written about his stuff with the other. It lives on its merits and its circulation, and is indifferent to advertisements.

Plainly, if you are that kind of man, it is the kind of friend you want. You can make its acquaintance if you will.

### What it is.

It is a journal for men—

1.—Men who are studying to get to the top of their profession. It encourages the earnest young man's desire for knowledge in several ways.

2.—Men who are getting there. It gives the practical experience, direct from the work and the workshop, of men who are getting there.

3.—Men who have got there. It does not confine itself to technical knowledge (extensively as it treats this), but gives from time to time sound information about organisation and the management of large engineering undertakings by men who have got there.

Published monthly, price eightpence. May be obtained from all bookstalls and newsagents.

"The Electric Journal,"

Donington House, Norfolk Street, Strand, W.C.

## "ELECTRICAL ENGINEERING" LIST OF SELECTED TECHNICAL BOOKS

We shall be pleased to send any of the following books to addresses in the United Kingdom at the *net* published prices named, unless otherwise stated. The increased price for sending abroad is also quoted after each book. All the books listed have been recommended by our editorial staff and reviewers.

Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-206 Temple Chambers, Temple Avenue, E.C., and should be accompanied by a remittance.

### Electricity Supply and Distribution.

(See also *Steam, Gas, and Water Plants*.)

- Power House Design. J. F. C. Snell. 21s. net; abr., 22s. (Reviewed Jan. 18th, 1912.)  
The Management of Public Electric Supply Undertakings. A. H. Seabrook. 7s. 6d. net; abr., 7s. 11d. (Reviewed Dec. 11th, 1913.)  
Heavy Electrical Engineering. H. M. Hobart. 16s. net; abr., 17s. 3d. (Reviewed July 15th, 1909.)  
Three-Phase Transmission. W. Brew. 7s. 6d. net; abr., 8s. 1d.  
Overhead Electric Power Transmission. A. Still. 12s. 6d. net. (Reviewed Dec. 11th, 1913.)  
Electric Cables, Their Construction and Cost. Coyle and Howe. 15s. net; abr., 15s. 8d.  
Theory of Electric Cables and Networks. Alex. Russell. 8s. net; abr., 8s. 8d. (Reviewed Oct. 7th, 1909.)  
Electric Mains and Distributing Systems. Dick and Fernie. 10s. 6d. net; abr., 11s. 4d. (Reviewed Feb. 29th, 1912.)  
Practical Calculation of Transmission Lines. L. W. Rosenthal. 8s. 6d. net. (Reviewed Oct. 14th, 1909.)  
Transmission Line Formulas. H. B. Dwight. 8s. 6d. net; abr., 8s. 10d. (Reviewed Jan. 29th, 1914.)  
Electricity Meters. C. Gerhardt. 9s. net; abr., 9s. 8d.  
Electricity in Factories and Workshops. A. P. Haslam. 7s. 6d. net; abr., 8s. (Reviewed Aug. 5th, 1909.)  
Village Electrical Installations. W. T. Wardale. 2s. net; by post, 2s. 2d. (Reviewed Jan. 29th, 1914.)

### Steam and Gas and Oil Engines, Water Plants, and General Engineering

- Steam Turbine Engineering. Stevens and Hobart. 21s. net; abr., 22s. 4d.  
The Steam Turbine. R. M. Neilson. 4th edition. 15s. net; abr., 15s. 10d.  
Heat Engines; Steam, Gas, and Oil (Elementary Manual of). A. Jamieson. 13th edition. 3s. 6d.; abr., 3s. 9d.  
Steam Boilers. W. Inchley. 8s. 6d.; abr., 9s. (Reviewed Sept. 26th, 1912.)  
Boiler Draught. H. K. Pratt. 4s. net; abr., 4s. 3d. (Reviewed Jan. 18th, 1912.)  
Boiler Explosions. E. J. Rimmer. 4s. 6d. net; abr., 4s. 11d. (Reviewed Sept. 26th, 1912.)  
Fuel; Solid, Liquid and Gaseous. J. S. S. Brame. 12s. 6d. net; abr., 13s. 2d.  
The Indicator Handbook. C. N. Pickworth. *Part I.*, The Indicator; Its Construction and Application. 3s. net; abr., 3s. 4d. *Part II.*, The Indicator Diagram: Its Analysis and Calculation. 5th ed. 3s. net; abr., 3s. 4d. (Reviewed Nov. 28th, 1912.)  
Diesel Engines for Land and Marine Work. A. P. Chalkley. 8s. 6d. net; abr., 9s. 2d. (Reviewed Feb. 29th, 1912.)  
The Gas, Petrol, and Oil Engine. Dugald Clerk, F.R.S. *Vol. I.*, Thermodynamics of the Gas, Petrol, and Oil Engine, together with Historical Sketch. 12s. 6d. net; abr., 13s. 3d. *Vol. II.*, Gas, Petrol, and Oil Engines in Practice. Clerk and Burls. 25s. net; abr., 26s. 3d. (Reviewed March 13th, 1913.)  
Primer of the Internal Combustion Engine. H. E. Wimperis. 2s. 6d. net; by post 2s. 9d. (Reviewed Nov. 28th, 1912.)  
Gas Engines. Marshall and Sankey. 6s. net; abr., 6s. 8d. (Reviewed May 18th, 1911.)  
Suction Gas Plants. C. A. Smith. 2nd edition. 5s. net; abr., 5s. 6d.  
Electric Crane Construction. C. W. Hill. 25s. net; abr., 25s. 10d. (Reviewed May 18th, 1911.)  
Foundations and Machinery Fixing. F. H. Davies. 2s. net; by post 2s. 2d. (Reviewed March 13th, 1913.)

### Electric Lamps, Wiring, &c.

- The Development of the Incandescent Electric Lamp. G. B. Barham. 5s. net; abr., 5s. 6d. (Reviewed May 16th, 1912.)  
Die elektrischen Metallfaden-Glühlampen. C. H. Weber. 16s. net; by post, 17s. (Reviewed March 19th, 1914.)  
Application of Arc Lamps to Practical Purposes. Justus Eck. 2s. 6d. net; by post, 2s. 9d. (Reviewed Dec. 15th, 1910.)  
Arc Lamps and Accessory Apparatus. J. H. Johnson. 1s. 6d. net; by post, 1s. 7d. (Reviewed May 18th, 1911.)  
The Practice of Electrical Wiring. D. S. Munro. 3s. net; abr., 3s. 3d. (Reviewed Jan. 16th, 1913.)

Electric Wiring, Fittings, Switches, and Lamps: Circuits. W. P. Maycock. 6s. net; abr., 6s. 8d. (Reviewed May 18th, 1911.)

Theory and Practice of Electric Wiring. W. S. Ibbetson. 5s.; abr., 5s. 6d.

Electric Circuit. Theory and Calculations. W. P. Maycock. 3s. 6d. net; abr., 3s. 11d. (Reviewed Dec. 11th, 1913.)

Electric Wiring. W. C. Clinton. 3rd ed. 2s. net; by post, 2s. 3d. (Reviewed Sept. 25th, 1913.)

Mill and Factory Wiring. R. G. Devey. 2s. net; by post, 2s. 2d. (Reviewed Nov. 16th, 1911.)

Ship Wiring and Fitting. T. M. Johnson. 1s. net; by post, 1s. 1d. (Reviewed Jan. 18th, 1912.)

Institution of Electrical Engineers' Wiring Rules, with Extracts from the Board of Trade Regulations and the Home Office Rules for Mines. 6th ed. 6d. net; by post, 7d.

Phoenix Fire Office Rules for Electric Installations. 6d. net; by post, 7d.

### Motors, Generators, and Transformers (Theory and Design of).

- The Dynamo. Hawkins and Wallis. 5th edition. *Vol. I.*, 10s. 6d. net; abr., 11s. 6d. *Vol. II.*, 10s. 6d. net; abr., 11s. 6d. (Reviewed March 31st, 1910.)  
High-speed Dynamo Electric Machinery. Hobart and Ellis. 25s. 6d. net; abr., 26s. 10d. (Reviewed Dec. 10th, 1908.)  
Electric Motors. H. M. Hobart. 18s. net; abr., 19s. 4d. (Reviewed Dec. 15th, 1910.)  
Armature Construction. Hobart and Ellis. 15s. net; abr., 15s. 6d.  
Elementary Principles of Continuous Current Dynamo Design. H. M. Hobart. 7s. 6d. net; abr., 8s.  
Elementary Principles of A.C. Dynamo Design. A. G. Ellis. 12s. net; abr., 12s. 8d. (Reviewed March 16th, 1911.)  
The Design of Alternating-current Machinery. J. R. Barr and R. D. Archibald. 12s. 6d. net; abr., 13s. 5d. (Reviewed March 13th, 1913.)  
Continuous Current Dynamos and Motors and Their Control. W. R. Kelsey. 2nd ed. 7s. 6d. net; abr., 8s. 2d. (Reviewed August 11th, 1910.)  
Continuous Current Machine Design. For Advanced Students. W. Cramp. 5s. net; abr., 5s. 6d. (Reviewed Dec. 15th, 1910.)  
Single-phase Commutator Motors. F. Creedy. (Part I.) 7s. 6d. net; abr., 7s. 11d. (Reviewed May 22nd, 1913.)  
The Induction Motor. B. F. Bailey. 10s. 6d. net. (Reviewed Jan. 18th, 1912.)  
Transformers. Bohle and Robertson. 21s. net; abr., 22s. (Reviewed May 18th, 1911.)  
Design of Static Transformers. M. M. Hobart. 6s. net; abr., 6s. 5d. (Reviewed August 17th, 1911.)  
Insulation of Electric Machines. Turner and Hobart. 10s. 6d. net; abr., 11s. 3d.  
Insulation and Design of Electrical Windings. Fleming and Johnson. 7s. 6d. net; abr., 8s. 1d. (Reviewed Jan. 29th, 1914.)

### Electric Traction.

- Electrical Traction. Wilson and Lydall. *Vol. I.*, Tramways and D.C. Railways. 15s. net; abr., 16s. *Vol. II.*, Three-phase and Single-phase Alternating-current Traction. 15s. net; abr., 16s.  
Electric Traction on Railways. P. Dawson. 25s. net; abr., 26s. 4d.  
Electric Trains. H. M. Hobart. 6s. net; abr., 6s. 8d. (Reviewed Feb. 16th, 1911.)  
Elements of Electric Traction for Motormen and Others. H. W. Gant. 5s. net; abr., 5s. 8d.  
Electric Tramcar Handbook. For Motormen, Inspectors, and Depot Workers. W. A. Agnew. 1s. 6d. net; by post, 1s. 8d.

### Mining.

- Application of Electric Power to Mines and Heavy Industries. W. H. Patchell. 10s. 6d. net; abr., 11s. 5d. (Reviewed March 13th, 1913.)  
Electrical Practice in Collieries. D. Burns. 3rd edition. 7s. 6d. net; abr., 8s. 2d.  
Electrical Mining Installations. P. W. Freudemacher. 2s. net; abr., 2s. 2d. (Reviewed Nov. 16th, 1911.)  
Electric Blasting Apparatus and Explosives. W. Maurice. 8s. 6d. net; abr., 9s.  
The Shot-Firer's Guide. W. Maurice. 3s. 6d. net; abr., 3s. 10d.

### Telephony, Telegraphy, Wireless Telegraphy, and Railway Signalling.

- Practical Telephone Handbook and Guide to Telephone Exchanges. J. Poole. 5th edition. 6s. net; abr., 6s. 8d.  
Manual of the Telephone. W. Aitken. 18s. net; abr., 19s. 4d. (Reviewed Feb. 29th, 1912.)  
Common Battery Telephony Simplified. W. Atkins. 3s. net; abr., 3s. 3d.  
Telephone Erection and Maintenance. H. G. White. 1s. 6d. net; by post, 1s. 9d. (Reviewed Sept. 25th, 1913.)  
Telephone Cables. J. C. Slippy. 10s. 6d. net. (Reviewed Jan. 29th, 1914.)  
Telegraphy. The Telegraph System of the British Post Office. T. E. Herbert. 6s. 6d. net; abr., 7s. 6d.  
American Telegraph Practice. D. McNichol. 17s. net.

Submarine Telegraphs, Their History, Construction and Working. Charles Bright. 63s. net; abr., 63s., carriage forward.  
 Students' Guide to Submarine Cable Testing. Fisher and Darby. 7s. 6d. net; abr., 8s.  
 Submarine Cable-Laying and Repairing. H. D. Wilkinson. 15s. net; abr., 15s. 9d.  
 Principles of Electric Wave Telegraphy. J. A. Fleming, F.R.S. 2nd edition. 28s. net; abr., 29s. 8d. (Reviewed Dec. 15th, 1910.)  
 Elementary Manual of Radiotelegraphy and Radiotelephony for Students and Operators. J. A. Fleming, F.R.S. 7s. 6d. net; abr., 8s. (Reviewed Dec. 31st, 1908.)  
 Radio-Telegraphy. C. C. Monckton. 6s. net; abr., 6s. 6d.  
 A Handbook of Wireless Telegraphy. J. Erskine-Murray. 5th ed. 10s. 6d. net; abr., 11s. 3d. (Reviewed March 19th, 1914.)  
 Manual of Wireless Telegraphy and Telephony. A. F. Collins. 3rd edition. 6s. 6d. net; abr., 7s. (Reviewed May 22nd, 1913.)  
 Handbook of Technical Instruction for Wireless Telegraphists. J. C. Hawkhead. 3s. 6d. net; abr., 3s. 11d. (Reviewed Jan. 29th, 1914.)  
 Wireless Telegraphy and Telephony. W. J. White. 2nd ed. 2s. 6d. net; by post 2s. 10d. (Reviewed Nov. 28th, 1912.)  
 Bells, Indicators, Telephones, and Burglar Alarms, &c. Redfern and Savin. 1s. 6d. net; by post, 1s. 7½d.  
 Power Railway Signalling. H. Raynor Wilson. 18s. net; abr., 19s. (Reviewed Nov. 5th, 1908.)

### Electrical Engineering (General), Text Books, &c.

Electrical Engineering for Artisans and Students. Slingo, Brooker, and Wall. 12s. 6d.; abr., 13s. 6d.  
 Junior Magnetism and Electricity. Jude and Satterly. 2s. 6d. net; abr., 2s. 9d. (Reviewed Sept. 26th, 1912.)  
 Electrotechnics. J. Henderson. 3s. 6d.; abr., 3s. 9d. (Reviewed August 11th, 1910.)  
 Technical Electricity. Davidge and Hutchinson. 3rd ed. 5s. 6d. net; abr., 6s. (Reviewed Jan. 16th, 1913.)  
 Electrical Engineering. A. Thomälén. Translated by G. W. O. Howe. 15s. net; abr., 16s. 4d.  
 Practical Electricity. Ayrton and Mather. 9s. net; abr., 9s. 10d. (Reviewed March 16th, 1911.)  
 Alternating Currents. Alex. Russell. 2 vols. 12s. net each; abr., 12s. 9d. each.  
 Formulae and Tables for the Calculation of Alternating Current Problems. L. Cohen. 12s. 6d. net. (Reviewed Jan. 29th, 1914.)  
 Alternating Currents and Alternating-Current Machinery. Jackson and Jackson. 23s. net; abr., 24s. 1d. (Reviewed Jan. 29th, 1914.)  
 Alternating Currents. Alfred Hay. 6s. net; abr., 6s. 10d.  
 Continuous-Current Engineering. A. Hay. 5s. net; abr., 5s. 8d.  
 A Primer on Alternating Currents. W. G. Rhodes. 2s. 6d. net; by post 2s. 9d. (Reviewed Sept. 26th, 1912.)  
 Practical Alternating Currents and Alternating Current Testing. C. F. Smith. 6s. net; abr., 6s. 7d. (Reviewed Sept. 25th, 1913.)  
 Laboratory Manual of Alternating Currents. J. H. Morecroft. 7s. 6d. net; abr., 8s. 2d. (Reviewed May 22nd, 1913.)  
 Direct and Alternating Current Manual. Bedell and Pierce. 8s. net; abr., 8s. 8d. (Reviewed May 16th, 1912.)  
 Practical Testing of Electrical Machinery. Oulton and Wilson. 4s. 6d. net; abr., 4s. 9d. (Reviewed Dec. 15th, 1910.)  
 Exercises in Electrical Engineering. Mather and Howe. 1s. 6d. net; by post, 1s. 8d.  
 Examples in Applied Electricity. C. G. Lamb. 2s. 6d. net; by post, 2s. 7½d. (Reviewed Sept. 26th, 1912.)  
 Questions and Answers in Electrical Engineering. Moore and Shaw. 2s. 6d. net; abr., 2s. 9d.  
 Whittaker's Arithmetic of Electrical Engineering. 2nd edition. 1s. net; by post, 1s. 2½d. (Reviewed August 10th, 1911.)  
 Arithmetic of Electrical Measurements. W. R. P. Hobbs. 13th ed. 1s.; by post, 1s. 2d. (Reviewed Dec. 30th, 1909.)  
 Vectors and Vector Diagrams. Applied to the Alternating-current Circuit. Cramp and Smith. 7s. 6d. net; abr., 8s. (Reviewed Oct. 21st, 1909.)  
 Dynamo and Motor Attendants and their Machines. F. Broadbent. 7th ed. 1s. 6d. net; by post, 1s. 9d.  
 Solenoids, Electromagnets, and Electromagnetic Windings. C. R. Underhill. 8s. net; abr., 8s. 9d.

### Pocket Books and Hand-books.

Pocket Book of Useful Formulae and Memoranda for Civil, Mechanical, and Electrical Engineers. Sir G. L. Molesworth, K.C.I.E. With an Electrical Supplement by W. H. Molesworth. 27th ed. 5s. net; abr., 5s. 4d.  
 The Pocket Book of Pocket Books. Being Molesworth's and Hurst's Pocket Books (latest editions), printed on India paper and bound together in one volume. 10s. 6d. net.  
 Pocket Book of Electrical Rules and Tables for the Use of Electricians and Engineers. Munro and Jamieson. 19th ed. 8s. 6d.; abr., 8s. 10d.  
 Electrical Tables and Memoranda. S. P. Thompson. 2nd ed. 1s. net; by post, 1s. 1d. (Reviewed Sept. 25th, 1913.)  
 Engineering and Electric Traction Pocket Book. P. Dawson. 4th edition. 20s. net; abr., 21s. 6d.  
 Electrical Engineer's Pocket Book. H. A. Foster. 5th ed. 21s. net; abr., 22s.  
 The Electrician Wireman's Pocket Book and Electrical Contractor's Handbook. Robinson and Warriow. 5s. net; abr., 5s. 3d. (Reviewed May 16th, 1912.)  
 Whittaker's Electrical Engineer's Pocket Book. K. Edgcumbe. 5s. net; abr., 5s. 4d.  
 American Electricians' Handbook. 12s. 6d. net. (Reviewed March 19th, 1914.)  
 Mechanical World Electrical Pocket Book for 1914. 6d. net; by post, 8d. (Reviewed Dec. 11th, 1913.)

### Miscellaneous.

Standard Specifications of the Engineering Standards Committee, at net published prices. (List on application.)  
 Illumination. A. P. Trotter. 8s. 6d. net; abr., 9s. 2d. (Reviewed Nov. 16th, 1911.)  
 Elementary Principles of Illumination and Artificial Lighting. A. Blok. 3s. 6d. net; abr., 3s. 10d. (Reviewed March 19th, 1914.)  
 Resuscitation from Electric Shock. C. A. Lauffer. 2s. net; by post, 2s. 1½d. (Reviewed Sept. 25th, 1913.)  
 Simple Electric Cookery. May Little. 1b. 6d. net; by post, 1s. 9d. (Reviewed Sept. 25th, 1913.)  
 Industrial Electrical Measuring Instruments. K. Edgcumbe. 8s. net; abr., 8s. 10d.  
 Electric Furnaces in the Iron and Steel Industry. Rodenhausen and Schoenawa. 15s. net; abr., 15s. 9d. (Reviewed May 22nd, 1913.)  
 Storage Batteries. H. W. Morse. 6s. 6d. net; abr., 6s. 10d. (Reviewed May 22nd, 1913.)  
 Dynamo Lighting for Motor-cars. By M. A. Codd. 2s. 6d. net; by post, 2s. 10d. (Reviewed Sept. 25th, 1913.)  
 India-rubber Laboratory Practice. W. A. Caspari. 5s. net; abr., 5s. 4d.  
 The Law relating to Electric Lighting. J. Shireess Will. 4th ed. Revised by W. E. T. Jones. 27s. 6d. net; British Colonies, 29s. (Reviewed March 13th, 1913.)  
 Electric Lighting Accounts. G. Johnson. 2nd Edition. 7s. 6d. net; abr., 7s. 11d. (Reviewed Jan. 29th, 1914.)  
 Magneto and Electric Ignition. W. Hibbert. 2s. net; by post, 2s. 2d. (Reviewed Nov. 28th, 1912.)  
 Quick and Easy Methods of Calculating: A Simple Explanation of the Theory and Use of the Slide Rule, Logarithms, &c. R. G. Blaine. 3rd edition. 2s. 6d.; abr., 2s. 9d.  
 The Slide Rule. A Practical Manual. C. N. Pickworth. 2s.; abr., 2s. 3d. 12th edition. (Reviewed March 16th, 1911.)  
 Engineering as a Profession. Fleming and Bailey. 2s. 6d. net; by post, 2s. 9d. (Reviewed Sept. 25th, 1913.)  
 Electrical Dictionary: A Popular Encyclopædia of Words and Terms used in the Practice of Electrical Engineering. T. O'Connor Sloane. 4th edition. 7s. 6d.; abr., 8s. 3d.  
 Technical, Industrial and Commercial Vocabulary, English-French-German. E. Hospitalier. Revised edition. 8s.; by post, 8s. 4d.  
 A Pocket Glossary of English-German and German-English Technical Terms. Horner and Holtzmann. 3s.; abr., 3s. 2d. (Reviewed Sept. 25th, 1913.)  
 Technical Dictionaries in Six Languages: English, Spanish, German, Russian, French, Italian. Edited by Deinhardt and Schlomann:—  
 Vol. II., Electrical Engineering. Cloth, 25s. net; abr., 25s. 10d. Leather, 30s. net; abr., 30s. 10d.  
 List of other volumes on application.

USE THIS LIST AS AN ORDER FORM.

WE WILL SEND YOU ANOTHER TO KEEP FOR REFERENCE.

To the KILOWATT PUBLISHING CO., LTD., 203 Temple Chambers, London, E.C.

Please send me the books which I have marked on this list. A remittance of is enclosed.

Please write very distinctly.

Name .....  
 Address .....

ALL ORDERS MUST BE ACCOMPANIED BY A REMITTANCE.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,383.

I have a 30 h.p. three-phase motor, which is designed to run on a 365-volt circuit, at 580 r.p.m., 40 cycles. The only supply pressures available are 230 volts, and 625 volts, 40 cycles. What do you advise me to do?—"UTILITY."

(Replies must be received not later than first post, Thursday, March 26th.)

### ANSWERS TO No. 1,381.

On accumulator switchboards for lighting installations, the charge and discharge regulating switches for the end cells are often interlocked, so that there cannot be more cells in the discharge circuit than in the charge circuit, at any time. Why is this?

The first award (10s.) is made to "A. E. B." for the following reply:—

The reason for this interlocking of regulating switches can perhaps be best explained by referring to the following diagrams. Fig. 1. shows the "charge" switch in position for charging full battery, and the "discharge" switch on about

mid-position, i.e., the end cells from 3 to 5 are not being discharged through the load. Now, should the battery be charging while the load is on, the dynamo, which is giving a higher voltage than the battery, will be both charging it and supplying current to the load. It is obvious that the end cells from 3 to 5 will also be charging at a more rapid rate than the others, due to the additional current from the load circuit passing through them. These end cells will probably be overcharged, but this will not harm them. Fig. 2 shows what may happen if the regulating switches are not interlocked. In this case more cells are shown in the load circuit than are being charged by the dynamo. It can easily be seen that the direction of current in these end cells will be the reverse to that in Fig. 1, i.e., they are being discharged. Should this go on for some time unnoticed, it is very probable they will be quite discharged and spoilt. In these diagrams I have omitted the usual switches, fuses, and automatic cut-out, &c., as they will only make them more complicated, and their insertion is not required for these remarks. In conclusion, I should like to state that it would not be necessary to have interlocking regulating switches where the battery is sufficiently large to take full load for a long period, as there is little likelihood of the two running

together for a sufficient length of time to discharge the end cells completely. It is only where, to save initial cost, a small battery has been installed, which it is intended should work with the generator during the period of heaviest load, that these switches should be installed.

The second award (5s.) is made to "C. E.," who writes as follows:—

Fig. 3 shows a simple diagram of connections for a small installation in which the supply can be obtained from the battery, or battery and dynamo combined, when supplying heavy loads. By manipulating the charge and discharge

FIG. 3.

switches the dynamo can be arranged to charge the battery, and, at the same time, to supply the load, in the case of light loads. The charging and discharging switches C and D are often interlocked to prevent the switch C being placed on a lower cell than the switch D. Should this occur (as shown dotted in figure) the current passing to the distributing board would flow through the intermediate cells in the discharging direction, helping to discharge them. In a very short time the voltage of these cells would be reduced, the cells being sulphated and ruined. These end cells are often much larger than the remainder of the battery, as, even when the charge and discharge switches are correctly manipulated, some of the end cells have to carry the whole of the main current, unless C and D happen to be on the same cell. The necessary instruments are omitted in the figure to simplify the diagram.

**Tenders for Turbo-Generators.**—In consequence of representations made by the British Electrical and Allied Manufacturers' Association, the Incorporated Municipal Electrical Association has expressed the opinion that not less than three weeks is a reasonable time to be allowed for the preparation of tenders for turbine plant; and they ask their members to act in accordance with this view whenever practicable.

**Compulsory Working of Patents.**—The resolution proposed by the Manchester Chamber of Commerce was adopted at the meeting of the Association of Chambers of Commerce of the United Kingdom last week. The resolution aims at restoring the full effectiveness of Section 27 of the Patents Act, which deals with the revocation of a patent for non-working (see ELECTRICAL ENGINEERING, Jan. 22nd, p. 48, and Feb. 19th, p. 102). The resolution is as follows:—"That in view of the fact that Mr. Justice Parker's comments in *Hatschek's case* in the year 1909 as to the extent of the onus devolving upon any applicant who seeks revocation of a patent for non-working under section 27 of the Patents and Designs Act, 1907, have deprived the section of its effectiveness, this association urges upon the Government to amend the rules in such terms as will place the burden of proof on the patentee, while adequately safeguarding him from vexations and frivolous applications—an effect which was the object of those who drafted the Act of 1907; and that a deputation be appointed to interview the President of the Board of Trade on the subject." An amendment by the London Chamber to add: "And that as a preliminary to any action for revocation the applicant should prove that he has applied for, and been refused, a licence, or that the terms offered are unreasonable," was seconded by the Newcastle Chamber, was not agreed to.

**The Institution of Electrical Engineers.**—The following is the result of the ballot for the election of new members, and for transfers from one class to another, at the meeting on Thursday. Candidates elected:—*As Members:* H. Bille, O. Feldmann. *As Associate Members:* W. P. Fuller, M. Jernison, J. H. Tasker. *As Graduates:* E. Allington, W. S. Browne, P. C. Fernando, J. S. Hollinrake, W. Phillips, W. R. Williams. *As Students:* L. A. T. Broadwood, G. B. Burke, C. J. Burrage, A. N. Cam, F. A. E. Caspar, J. Cheshire, E. H. Croft, H. S. Cuerden, M. L. Delaney, F. Dixon, P. Dobie, J. M. Furnival, R. W. Harrison, F. C. Lawrence, W. H. J. Norburn, E. D. T. Norris, A. Nymau, H. P. Porter, H. G. Poynter, W. Sinclair, L. C. R. Smith, W. B. Smith, E. J. Symons, C. E. Tolley, S. H. Trippie. *Candidates transferred:* From Associate Member to Member: P. V. Hunter. From Student to Associate Member: A. C. Timmis, S. S. A. Watkins. From Student to Graduate: L. T. G. Mansell.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published March 12th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

4,082/13. **Electrolytic Manufacture of Copper and Zinc Oxides, &c.** C. WHITE. Copper, zinc, lead, tin, and bismuth oxides are obtained by the electrolysis of a boiling solution of an alkali chloride. The anode is of the metal whose oxide is required.

4,723/13, 4,724/13, and 4,725/13. **Furnaces for the Fixation of Nitrogen.** E. KILBURN SCOTT. Perforated horn-shaped electrodes consisting of a tube divided longitudinally into two compartments and with a cap slipped over one end, are used. Concentric tubes containing magnetite project into the gap and form auxiliary electrodes. Power is supplied through a transformer having considerable magnetic leakage at abnormal loads.

4,777/13. **Wireless Telegraphy.** F. J. CHAMBERS. An auxiliary spark gap, in series with the main gap, bridges a capacity or inductance. Resonance between primary and aerial circuits in quenched spark systems is thus automatically destroyed. Six figures.

6,341/13. **Alarms for Order Telegraphs.** R. W. WILLIAMS. A rotary switch is combined with a mechanical order telegraph to complete a bell circuit if the order is not obeyed. Three figures.

8,568/13. **Incandescent Lamps.** T. GUISTI. Drawn filaments are wound as a spiral, helical cone, or spiral pyramid, and mounted on a single central transparent stem. Four figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Names in *italics* indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** AYRTON [Electrodes] 1,775/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** BROWLASKI [Insulators] 7,382/13; MASCHINENFABRIK OEBLIKON [Circuit regulating relay systems] 15,060/13.

**Dynamos, Motors, and Transformers:** A.-G. BROWN, BOVERI ET CIE [Cooling of apparatus built in connection with a motor] 13,610/13; SIEMENS DYNAMO WORKS (*Siemens Schuckertwerke Ges.*) [Windings] 14,380/13; BROOKS & HOLT [Variable-speed dynamos] 15,686/13; CAMPBELL [Motors for portable drills, &c.] 16,428/13; ALEXANDERSON [Polyphase commutator motors] 19,517/13; SIEMENS SCHUCKERTWERKE GES. [Oil-insulated transformers] 24,117/13.

**Electrometallurgy and Electrochemistry:** HYBINETTE [Electrolytic extraction of copper from its ores] 22,744/13 and 22,745/13; YOUNT, FINIGAN, and BRANNAMAN [Welding] 24,472/13.

**Heating and Cooking:** STOTT and SCHOFIELD [Water-heaters] 5,432/13; SIEMENS SCHUCKERTWERKE GES. [Irons] 17,665/13.

**Ignition:** KETTERING, 4,508/13; NEUFELDT & KUHNKE [Multi-pole magnet] 12,956/13.

**Incandescent Lamps:** SIEMENS & HALSKE A.-G., 17,416/13.

**Instruments and Meters:** PAUL [Thermo-couples for pyrometers] 12,708/13; PAUL, BRAUN & Co. [Recording] 20,796/13.

**Switchgear, Fuses and Fittings:** B. T.-H. Co and HEATH [Switches] 1,599/13; BIGGE and BUTT [Automatic switch] 1,927/13; SIEMENS DYNAMO WORKS and RODGERS [Induction motor-starting switches] 4,507/13; HOPE [Enclosed switches] 7,918/13; DAY [Connecting lamp-holders to conduits] 8,445/13; SOC. ANON. DES ETABLISSEMENTS L. BLERIOT [Switches and contacts] 9,592/13; GARRECHT [Extensible lighting fittings] 12,238/13; LUNDBERG and PEGG [Switches] 14,188/13; DRYSDALE and DISPLAYER Co. [Working switches] 16,609/13; SIEMENS BROS. (*Siemens & Halske A.-G.*) [Relays] 22,902/13; SCLATER [Mounting switches, &c., in boxes] 24,809/13; SIEMENS BROS. (*Siemens & Halske A.-G.*) [Setting apparatus from a distance] 28,822/13.

**Telephony and Telegraphy:** DERRIMAN (*Auto. Enunciator Co.*) [Telephony] 26,781/12 and 26,782/12; AUTO. TELEPHONE MFG. Co. (*Auto. Elec. Co.*) [Telephone systems] 4,499/13; HARRISON and JACOBS [Selective signalling] 4,584/13; THOMPSON (*Soc. Anon. des Telegraphes Edouard Belin*) [Telegraph transmission systems] 9,624/13; MILLERSH-JACKSON (*Signal Ges.*) [Charging and discharging condensers] 15,284/13; STERLING TELEPHONE & ELEC. Co. (*Telephonfabrik A.-G. vorm J. Berliner*) [Telephone selector switches] 19,592/13.

**Traction:** RAMSEY and MALEY [Section insulators for contact lines] 4,931/13; SIMPSON [Sand discharge valves for electrically-driven vehicles] 14,459/13; UNDERWOOD [Trolley heads] 16,705/13; SIEMENS-SCHUCKERTWERKE GES. [Electric vehicles] 27,472/13.

**Miscellaneous:** B.T.-H. Co. and WHEAT [Illuminating devices] 21,485/12; PHILIP and STEELE [Combustible gas detectors]

5,467/13; FITHIAN [Governing speed of engines at sea] 5,763/13; LEAVITT [Starting and stopping automobile torpedoes] 6,060/13; GELSDORF [Remote control of door and window locking] 11,504/13; SIEMENS BROS. and HIRD [Revolution counter] 12,437/13; FRIEDR. KRUPP A.-G. GRUSONWERK [Magnetic separators] 14,426/13; SCHUMANN [Alarm preventing unauthorised opening of locks] 15,259/13; CANDOLITE Co. and TAUSSIG [Imitation candle lamps] 17,918/13; DUBASH [Alarm to indicate if ship engine movements disagree with order telegraph] 24,966/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, Insulating Materials, &c.:** RENAULT [Vehicle lighting] 2,528/14; ELEKTRIZITATS A.-G. HYDRAWERK [Working weak-current installations] 4,237/14.

**Electrometallurgy and Electrochemistry:** LANDRELL [Treating liquids] 3,181/14; SOC. ELECTRO METALLURGIQUE DE ST. BERON [Furnaces] 3,835/14; HELFENSTEIN ELEKTRO GES. [Condensation of metallic vapours] 4,101/14.

**Heating:** A.E.G. [Composite heat storage apparatus] 4,355/14. **Instruments and Meters:** A.E.G. [Regulation of phase relations, current and pressure, in a Ferraris meter] 3,912/14.

**Switchgear, Fuses and Fittings:** DEHLER [Pendants] 25,666/13; MAITRE [Contact-breakers] 3,583/14; DEAN [Switches] 3,706/14.

**Telephony and Telegraphy:** GIRARDEAU [Wireless stations] 3,192/14; SOC. MARIUS LATOUR ET CIE [High-frequency transformation for wireless] 4,345/14.

**Miscellaneous:** MASCHINENBAU ANSTALT HUMBOLDT [Electromagnetic shaking feeds or jiggers] 3,986/14; HARTMANN & BRAUN A.-G. [Condensers of the ring type] 4,237/14.

The following Amended Specifications may now be obtained:—**Incandescent Lamps:** C. H. FISCHER [Drawn filaments] 9,981/12.

**Miscellaneous:** O. F. WERNDORFF [Signalling vehicle movements] 7,524/12; B. T.-H. Co. (*G. E. Co., U.S.A.*) [Furnace lining] 29,389/12.

### Opposition to Grant of Patent Entered

26,800/12. **Drawn Tungsten Filaments.** C. TRENZEN. Opposition has been entered to the grant of this patent (see ELECTRICAL ENGINEERING, January 22nd, p. 51).

### Grant of Patents Allowed

25,606/12. **Time Lag for Circuit-Breakers.** J. G. STATTER. The Comptroller has allowed the Grant of this Patent in spite of the opposition entered.

2,471/13. **Static Three Phase—Single Phase Transformation.** F. SPINELLI. The Comptroller has allowed the Grant of this Patent, subject to amendment.

### Expiring and Expired Patents

The following Patents expire during the current week, after a little of fourteen years:—

5,387 of March 21st, 1900. **Selective Wireless Signalling.** G. MARCONI. Transmitter and receiver have in circuit an induction coil and two conductors, one of which is earthed in each case. For the conductors, concentric insulated cylinders may be used; the inner one is earthed.

5,593 of March 24th, 1900. **Electrolytic Mercury Meters.** A. WRIGHT and REASON MFG. Co. This patent relates to several important details of construction. The well-known means of obtaining a second dial effect is disclosed. The chance of crystallisation at the anode is reduced by convection currents. An index tube is used as an anode feeder.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems:** C. DE KANDO [Cascade control of poly-phase motors] 25,829/02; W. H. SCOTT [Printing-press motor control] 25,887/03.

**Dynamos and Motors:** B. T.-H. Co. (*G. E. Co., U.S.A.*) [Self-exciting rotaries] 25,729/04; [Self-exciting homopolar machines] 25,730/04; ALLMÄNNA SVENSKA ELEKTRISKA AKTIEBOLAGET [Compensated repulsion motors] 25,537/08.

**Instruments and Meters:** C. FÉRY [Calorimeters] 23,996/07.

**Switches, Fuses and Fittings:** J. C. A. WARD [Attaching fuse-wire to carriers without screws] 21,642/00; G. CHARLTON and W. E. BARTON [Quick make and break switches] 25,954/01; VERITY'S and W. G. PIPKIN [Circuit-breakers] 25,333/08; A. WEST [Controller contacts] 25,721/08; W. B. THORPE and THORPE METER SYNDICATE [Electrolytically-controlled switches] 25,763/08.

**Telephony and Telegraphy:** E. H. CHAMBERS [Tubular poles] 21,615/00; P. O. PEDERSEN [Telegraph records] 23,738/01; W. P. THOMPSON (*Soc. des Telegraphes Multiplex—Système E. Mercurier*) [Three-coil transformer for duplex] 24,397/01.

**Miscellaneous:** J. RENNIE [Speed indicators] 25,836/03.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 170. —

### A FRONT-CONNECTION SWITCHBOARD

WE are enabled, by the courtesy of the manufacturers, the Kartret Engineering Co., Queen Anne's Chambers, Westminster, to illustrate a neat front-connection switchboard for the St. Ivel Factory at Frome. It was found that there was not space in the engine-room for a board of the ordinary type, and so the construction shown was adopted. The depth from the wall to the extreme tip of the circuit-breaker handles is only 16 in. The board itself is 10 ft. long, and is made of enamelled slate sections fixed to

at the bottom. There are also three 50-ampere main lighting circuits fitted with "Kartret" switches and fuses. One voltmeter is permanently connected across the bus-bars, and the other will be connected by a three-way switch across the generators as required. The shunt field regulators are situated in the room next to the engine-room behind the switchboard. Record ammeters, some of which are of the "Circscale" pattern, are used, and the shunts are neatly arranged in front of the bars. There is no live metal on the back of the board, and the design is such that every piece of apparatus can be easily removed without upsetting the general arrange-

FRONT CONNECTION SWITCHBOARD FOR ST. IVEL FACTORY AT FROME.

an angle-iron frame. There are two 44-kw. and one 33-kw. 110-volt compound-wound generators, the leads from which are brought along a duct under the board. The equaliser bar is seen at the bottom, just above, and in front of the negative bus-bar, which is earthed. The disconnecting links are also clearly seen. For convenience this bar is made in three sections. Two are fixed at the top of the board, as the motor and lighting circuits supplied are led upwards. All the connections are of solid copper rod fitted with insulating bushes and outer fibre protecting tubes. Fireproof screens are also to be fitted at one or two points on the board where the maximum pressure between two points a few inches apart occurs. The generators are connected through the Whipp & Bourne overload and reverse circuit-breakers on the middle panels, and through Chamberlain & Hookham meters to the positive bus-bar. Five of the six 20-kw. motor circuits are also taken through overload circuit-breakers. One of these is arranged low down, as the connections in this case go out

ment. The board was made to the order of Cecil Cooper & Co. (Albert Road, Bournemouth). Mr. Phillip Dawe (Dacre House, Westminster) was Consulting Engineer.

**Siemens' Bohemian Concert.**—A rollicking Bohemian concert was held at Anderton's Hotel on Friday last, in which both the Upper Thames Street and Dalston Works staffs of Siemens Bros. Dynamo Works, Ltd., participated. The Dining Hall, where the concert took place, was filled to its utmost, and among the audience was a proportion of ladies. This is the first time that the staffs at Dalston and Thames Street have held a joint concert, and the appreciation shown for the different items would indicate that the innovation is a success. The programme was divided into two parts, with a short interval between, and there was a different chairman for each: Mr. A. H. Bate officiated at the first, and Mr. W. Le Marechal at the second. Mr. E. C. Laughton replied to the toast of the Dalston staff. It was not until a late hour that the jovial party broke up.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**STEAM TURBINES.**—An illustrated pamphlet describing the Willans' "Disc and Drum" turbine, has just been issued by Willans & Robinson, Ltd. (Victoria Works, Rugby). The advantages of a preliminary impulse stage, through which the steam passes before finishing its expansion, are set out, and the saving in space against a purely reaction turbine is clearly shown by illustrations. The construction of the well-known Willans' shrouded blading is explained, and various mechanical details are illustrated. Photographs of many recently erected turbo-generator sets are reproduced, and interesting particulars are given of back pressure and "pass out" turbines, exhaust steam, and mixed pressure turbines, special attention being given to the governor gear of the last-mentioned. A list is also given of turbines recently supplied.

**IRONS.**—A leaflet from the Edison & Swan United Electric Light Co., Ltd., (Ponders End, Middlesex), sets forth the advantages of the "Ediswan" 6 lb. domestic iron. This is of a very simple and robust construction, and if the element itself should fail a new one can be inserted by the user in a few moments. A modification has lately been made in the design of the handle, with the object of making the running of the iron as easy as possible.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**ASBESTOS-WOVEN NET RESISTANCES.**—A series of leaflets issued by the Schniewindt Electric Co. (40 and 41 Stanforth Street, Birmingham) describes the construction of its British-made asbestos-woven net resistances. These can be used for motor controllers, lamp dimmers, heaters, electro-medical apparatus, &c. Full information is given as to mounting and spacing the nets, so that adequate ventilation is obtained. These nets are very convenient for all control apparatus, as they are light, compact, cheaply mounted, have a large radiating surface, are not affected by vibration or jolting, and are suited for fine gradation, as it is easy to make tapplings. The prices of standard nets from the smaller size motors from 100 to 550 volts are given, but the nets can be made in quite large size, and may be used for large installations. The system is easily adaptable to heaters in different forms for small or large currents, and prices of a wide range of standard nets for these purposes are contained in the list before us. The "Triumph" aluminium water-boilers and stewing-pots, and the "Peerless" pipe-cutting pliers for contractors, wiremen, fitters, and others, are also brought to notice.

**BEARINGS.**—We have received from Chas. A. Matthews, 22 Bridge Street, Deansgate, Manchester, a catalogue of "Bamag" bearings. These bearings are of the ring lubricated type of special design, and are made both in a self-aligning form with swivelling bushes, or in the ordinary fixed form. The list is very complete, embracing many designs of bearings for use in different circumstances, and interesting information and illustrations relating to their manufacture and use are given.

## AN INTERLOCKED SWITCH PLUG

WE have received from the British Thomson-Houston Co., Ltd. (77 Upper Thames Street, E.C.), particulars of

FIG. 1.—INTERLOCKED SWITCH PLUG.

FIG. 2.—PLUG PREVENTED FROM BEING PUSHED HOME WHEN SWITCH IS ON.

an extremely simple but ingenious interlocking switch plug for use on heating, cooking, and other circuits. The object

aimed at is to make it impossible for the plug itself to be inserted when the switch is on, and to ensure that the circuit is broken before the plug is withdrawn. There is no mechanism at all; the interlocking action is achieved by having the knob of the switch in such a position that it overlaps the plug, so to speak. When the switch is on, the plug cannot be pushed in sufficiently far to make contact, owing to the interposition of this knob, as shown in Fig. 2. Again, on withdrawal the switch is pushed off by the fibre guard of the plug. The switch is at present made with a carrying capacity of 5 amperes, in the pattern illustrated, but there a 10-ampere size and a flush pattern in preparation.

## A HALF-WATT LAMP FITTING

WE illustrate here a special fitting for half-watt lamps with special reflectors, giving particularly good distribution of candle-power, which has been placed on the market by the Wardle Engineering Co., Ltd. (196 Deansgate, Man-

HALF-WATT LAMP FITTING.

chester). The external reflector affords the necessary protection from the weather, and the lower reflector is so formed that with a lamp rated at 3,000 c.p. as much as 5,000 c.p. is obtained at 20° below the horizontal. We understand that immediate deliveries can be given.

**Electric v. Gas Power.**—In connection with the relative merits of gas engines and electric motors for driving machinery, the following letter, which has been sent us by the British Thomson-Houston Co., Rugby, is of interest: "I have just been looking over your advertisement in the . . . and as it is now over twelve months since I had one of your 18 h.p. motors installed at my works (the Southend Machine Joinery Works), I feel it is only due to you to let you know that I am more than satisfied with its working, both in output and economy. It seems to me there is no comparison in the saving from first to last as against gas engines, besides which the motor is so clean, and takes up no room, and expense for oil is almost nil. You can make what use you like of this, because I am sure it is only by giving the results of practical tests that outsiders will be taught the possibilities of the up-to-date motor. (Signed) JOHN C. BEALE."

## A CHINESE CALENDAR

INSPECTION of the photograph reproduced here reveals some old friends surrounded by unfamiliar descriptive matter, and without having resource to reading the English characters at the top it can be seen by the Osram lamps, Freezor fans, and Magnet kettles, that it is a publication

of the enterprising General Electric Co. of China, Ltd., on behalf of their Chinese friends. The production is of a clever design, printed in a number of colours, and it is most interesting to see how the General Electric Co. have introduced their various specialities into the pictorial idea.

## ACCESSORIES FOR CONDUIT WIRING

IN addition to the porcelain interior for conduit boxes illustrated in ELECTRICAL ENGINEERING, Feb. 26th, p. 122), Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), have introduced the special design for ceiling-roses shown here.

This "Condulet" is firmly fixed in position, so that there

"CONDULET" CEILING FITTING.

is no risk of the terminals touching the sides of the iron box, and, as in the other case, the terminals are of large size, hexagonal in shape, and have a slot in the centre, so that there is no necessity to sever the conductor when wiring.

PUT YOUR

## DAY LOAD

UP 20 KWS. PER DAY  
THIS COMING SUMMER

BY PUSHING

A very strong practical article which does any kind of cooking operation, and uses any existing utensils.

A consumer who already has a "Belling Fire" will buy a "Belling Ring" at sight.

After a few weeks' use your customer will be so delighted with it that you will have no difficulty in selling a further addition, namely a "Belling Grill." This fits the same switch panel by just changing over the plugs (anything which has been previously boiled on the Ring can be kept boiling on the top of the grill whilst that article is being used, so that the 2 utensils with the one switch panel make a complete breakfast set).

When the weather gets really hot, a call by your representative explaining how the kitchen can be kept so cool, how a considerable saving in the meat bill is possible, how all the delicious flavour is retained in the cooked meat and done without any trouble by an Electric cooking oven, creates new interest.

When he further explains that the same reliable make, using the simple interchangeable plug system, can be installed straight away—well, that just clinches the matter. (With the Cooker it is best to add another switch panel, so that there are 2 panels for the 3 articles). Switch panels have Diamond H Switches, "Z" Fuses, Reyrolle 3 Pin Plugs.

It is scarcely necessary for us to add that this, our new "unit" system, enables you to sell to each consumer a complete cooking outfit by degrees, and its advantages in the event of accidents or renewals are obviously apparent.

We can despatch Rings in about 2 weeks.

We can despatch Grills in about 6 to 7 days.

We can despatch Ovens (certain sizes) in about 8 to 10 days.

Send your order for trial sample now.

It is possible to attach the flexible conductor to the terminals, together with its lampholder, at the bench, instead of, as is usual in wiring ceiling roses, having to work in an awkward position on the top of a ladder. The gripping arrangement relieves all direct pull on the terminals. The flexible is taken through a centre hole in the porcelain, and a small rubber ring is fitted, which by the weight of the shade on the end of the flexible is compressed and forms an effective grip, as well as an anti-vibrator. The cover is of better appearance than the ordinary white porcelain rose, and any finish can be used in keeping with the style of fitting. The fitting is supplied with the standard type of circular box, 3½ in. by 1½ in. deep in all the combinations.

### A NEW GRILLER

WE are able to illustrate the new griller recently perfected by Belling & Co. (Derby Road, Edmonton, N.). As may be seen from Fig. 1., seven "Belling" standard fire-bars are used. They are all connected in parallel, as each

BELLING GRILLER.

one can be wound for any pressure up to 500 volts, giving a total loading of 2,300 watts. Three degrees of heat are provided, and it is arranged that only the three middle bars are in circuit for cooking small joints. The elements are protected by means of a wire guard, and the top, complete with all

connections, may be removed from the body in a few moments. The size of the cooking space provided is 15 in. long, 8 in. high, by 12 in. deep, and the walls are made of sheet-steel with wired edges, thus making a strong, light, portable article. A drip pan, rack, and a loose front plate for converting the griller into a small oven are provided. The three terminals are arranged outside, so that they keep cool. A new design of a complete cooker, built up of unit parts, is also being put on the market.

### TENDERS INVITED AND PROSPECTIVE BUSINESS

#### Generating Stations, Sub-Stations, Mains, &c.

**Bacup.**—An application is to be made for a loan of £1,000 for extensions.

**Blackrock.**—Mr. J. P. Tierney, Consulting Engineer of Dublin, has been retained to advise the Council as to an electric supply scheme.

**Bury St. Edmunds.**—It has been decided to replace the existing storage battery with a new one of the same capacity at an estimated cost of £750.

**Devonport.**—Tenders are invited for a 1,250-kw. turbo-alternator and two 500-kw. rotary-converters and switchgear. (See advertisement on another page.)

**Dublin.**—An application is to be made to the Local Government Board for sanction to a loan of £77,000 for extensions.

**Edinburgh.**—Tenders are invited for a twelve months' supply of arc-lamp globes, cast-iron pavement boxes, and underground cable conduits. March 28th. Borough Electrical Engineer.

**Knaresborough.**—The Council has decided to proceed with the electric supply scheme prepared by Mr. George Wilkinson, Borough Electrical Engineer at Harrogate, outlined in our issue of February 26th.

**Southampton.**—Tenders are invited for a supply of cable for twelve months. March 27th. Borough Electrical Engineer. (See advertisement on another page.)

**Virginia (Co. Cavan).**—A Local Government Board inquiry will be held on the 31st inst. into a loan for public lighting.

**Warrington.**—Tenders are invited by March 31st for a 750-kw. rotary-converter and E.H.T. switchgear. Borough Electrical Engineer.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Croydon.**—Six houses, Cedar Road. J. S. Findlay, 18 Addiscombe Court Road.—Twelve houses, Woodside Court Road. R. B. Manser, 6 Guy Road, Beddington.—Five houses, Enmore Road, South Norwood. A. C. Blake, 10 Everton Road.—Eight houses, Grant Road. H. Felder, Grant Road.

**Eccleshall.**—New children's home.

**Hanley.**—Music hall in Stafford Street.

**Gosport.**—New Conservative and Unionist club. Architect, E. J. Thomas.

**Grimsby.**—New constitutional club. H. W. V. Shekell, Secretary, Victoria Street, Grimsby.

**Lisnaskea (Co. Fermanagh).**—It has been decided to light the workhouse by electricity.

**London: L.C.C.**—Tenders are invited for an electrical installation at Moxey Road Centres, Woolwich. About 65 points. March 23rd. (See advertisement on another page.)

**Manchester.**—Extensions to Monsall Hospital. City Architect.

**Mansfield.**—Hospital.

**Salford.**—Additions to workhouse.

**Stockport.**—New offices for Prudential Assurance Co.

**Torquay.**—New theatre. Architects, Richardson & Gill.

### Miscellaneous

**Australia.**—A supply of electrically-controlled clocks is required by the Postmaster-General, Sydney. Further particulars from 72 Victoria Street, S.W., or 73 Basinghall Street, E.C.

**South Africa.**—The Durban Corporation requires two electrically propelled ambulances. London Agents, Webster, Steel & Co., 5 East India Avenue, Leadenhall Street, E.C.

## TENDERS RECEIVED AND ACCEPTED

**Bolton.**—A contract for a supply of "Traction" type tantalum lamps for twelve months has been given to Siemens Bros. Dynamo Works, Ltd.

**Dublin.**—A contract for the supply of metal filament lamps for the tramway service has been given to the Edison & Swan United Electric Light Co.

**Exeter.**—The tender of the British Thomson-Houston Co. for a 1,000-kw. turbo-alternator at £4,211 has been accepted.

**London: Hammersmith.**—The tender of Doulton & Co. for 2,000 yds. of single-way cable duct has been accepted.

**L.C.C.**—The tender of Johnson & Phillips for 150 two-way change-over switches has been accepted at a price of £262 10s. Three other tenders were received.—The tender of Pope's Electric Lamp Co. for metal filament lamps is recommended for acceptance.

**Rochdale.**—The tender of James Howden & Co. for two turbo-alternators has been accepted. The General Electric Co. will be the sub-contractors for the alternators, and W. H. Allen, Son & Co. for the condensing plant.

**Whitehaven.**—The tender of Chamberlain & Hookham for meters has been accepted.

Messrs. Scholey & Co., Ltd., have received from the Maschinenfabrik Oerlikon an order for their special tool steel gear wheels and pinions for the motor equipments to be used in the electrification scheme of the London & North Western Railway.

The Mirrlees Watson Co. inform us that they have recently received orders for condensing plant for Leeds Corporation (per Willans & Robinson); Haunchwood Colliery and Griff Colliery (per Greenwood & Batley); Millom & Askam, Hematite Iron Co., Ltd. (per Fraser & Chalmers); Langwith Colliery, Enfield Lock (per Jas. Howden & Co.); Burgh of Kilmarnock; Ardrossan Harbour Co.; Frickley Colliery; Swanwick Colliery; Brunner, Mond & Co.; and Hulton Colliery.

Joseph Kaye & Sons, Ltd. (Lock Works, Leeds), inform us that they have just received further orders from the

British Navy for 4,468 of their patent seamless serrated oil-cans, with seamless spouts, making a total of 60,048 of this particular pattern alone to be distributed next month to the different dockyards.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £65 10s. to £66. (Last week, £65 15s. to £66 5s.)

**Agencies.**—George Ellison (Victoria Works, Warstone Lane, Birmingham) has appointed Kelsall & Parsons (Caledonian Chambers, 87 Union Street, Glasgow) as Agents for Scotland, and also Mr. A. B. Gott, Independent Buildings, Fargate, Sheffield, as representatives for South Yorkshire, Nottinghamshire, and Derbyshire.

**Bankruptcies.**—The trustees in the bankruptcy of Charles Lewis, Electrical Engineer, 29 Seymour Grove, Old Trafford, Manchester, have been released.

The first meeting of creditors in the bankruptcy of the Stolz Electrophone Co. will be held on March 24th at 11.15 a.m., at 33 Carey Street, Lincoln's Inn, W.C., and that of the contributories at 12 on the same day, at Bankruptcy Buildings.

## APPOINTMENTS AND PERSONAL NOTES

The salary of Mr. J. A. Bell, City Electrical Engineer, Aberdeen, has been increased from £700 to £750.

The salary of Mr. E. Fitzgerald, of the Dublin Electricity Department, is to be increased from £160 to £220, rising by increments of £10 to £300.

The salary of Mr. W. M. Rogerson, Borough Electrical Engineer at Halifax, has been increased from £600 to £700.

Mr. F. G. Richardson, of Bradford, has been appointed Tramways Manager at Colne, at a salary of £225 per annum.

Mr. W. R. Rogers, District Engineer to the Newcastle-upon-Tyne Electric Supply Co. for the Pelaw Felling district has been appointed District Engineer to the Gateshead district.

An additional draughtsman is required by the Hammersmith Electricity Department, at a salary of £150 per annum.

**Strike of Osram Bulb-Makers.**—At the Lemington Glass Works, near Newcastle, which are connected with the Osram Lamp Works, manufacture the glass bulbs for Osram and Robertson lamps, and are the only works of this character in England, some new machines were introduced a few months ago for opening and closing the moulds into which the bulbs are blown. Although such machines are in use in similar works all over the world, the workmen resented their introduction; eighty men and boys came out on strike at the end of last week, and over 300 other employees were thereby rendered idle. The machines in question certainly do away with some unskilled boy labour which was hitherto required, but, of course, do not in any way affect the apprentices who are learning the glass-blowing trade. So far as the glass-blowers are concerned, instead of diminishing their earnings, the wages sheets showed actually an average increase of 10 per cent since the introduction of the machines, and the consequently accelerated output. Without the machines, the works would be run unprofitably, as all the bulbs needed could then be obtained from the Continent more cheaply, and we understand that the management of the works is firmly refusing to discontinue the use of the machines in question.

## LOCAL NOTES

**Brentford: Gas Co. and Electric Supply.**—The Bill of the Brentford Gas Co., which asked for powers to apply to the Board of Trade for electric lighting orders, as mentioned in our last issue, was passed by the House of Lords Committee on Thursday. There were considerable modifications in the Bill, but these referred mainly to the gas supply powers. So far as the Company's electric lighting orders are concerned, it is authorised under the Bill to apply to the Board of Trade for electric lighting provisional orders in any districts in its area not supplied with electricity at the time of any application, and similar powers are taken to apply to the Board of Trade to take transfers of existing electric lighting orders for electrical undertakings. The Metropolitan Electric Supply Co.'s opposition will be renewed when the Bill comes before the House of Commons, and accordingly they took no part in the framing of the clauses. Another portion of the Bill, which is of some interest to electrical supply authorities in the area, is that the Company is authorised to supply power gas within a radius of half a mile from any of its gas works. At present the Company's works are at Brentford and Southall, whilst under the Bill two small companies in Staines and Sunbury are also being acquired with their gas works. It is improbable, however, that the electric supply authorities will be unduly affected by these powers, as it is of interest to note that the Tottenham Gas Co., which obtained similar powers some years ago for a much more industrial district than the Brentford Gas Co. has, does not at present supply a single consumer with power gas, it being admitted that other forms of power so far are well able to hold their own.

**Burnley: Heating and Cooking.**—The charge for electricity for all purposes other than lighting in private houses is to be reduced to 1d. per unit from March quarter.

**Dover: New Lighting Tariff.**—For a certain class of workmen's dwellings the Council has decided to give an unlimited supply of electricity for lighting at 6d. per week per house.

**Dublin: Street Lighting.**—A new system of street lighting by centrally-suspended lamps is being tried experimentally in some of the side streets.

**Galashiels: Electricity Supply.**—The Council has resolved to withdraw its opposition to the provisional order promoted by the Galashiels & District Electric Supply Co., on condition that the proposed charges are slightly modified, and that the Council has the option of purchasing the part of the undertaking within the Borough at shorter periods than forty-two years.

**Glastonbury: Street Lighting.**—The offer of a local company to take over the public lighting of the town on an agreement for ten years at £2 per lamp, has been approved by the Council.

**Leeds: Electric Vehicles.**—A proposal by the Tramways and Electricity Committee to purchase an electrically-driven motor-car for department purposes, mainly as an advertisement of the use of electricity in this direction, has been vetoed by the Council. The proposed expenditure was £600, and the argument that three good petrol cars suitable for the purpose could be purchased for this sum, seemed to have been sufficient to make the Electricity Committee give way.

**London: Bethnal Green.**—The Borough Council has finally agreed to the agreement with the Stepney Borough Council for a bulk supply.

**Hampstead: Electricity Accounts.**—The accounts of the Electricity Department for the year to March 31st, 1913, shows a net profit of £4,985, after meeting interest and sinking-fund charges amounting to £30,000.

**Marylebone: Electric Heating.**—In view of a report by the Medical Officer of Health to the effect that the cost of electric heating is slightly less than that of gas, the Electricity Department are to convert the heating arrangements at Barrett Street convenience from gas to electricity at a cost of £8 17s. 6d.

**St. Pancras: Income Tax Assessment.**—With reference to the note in this column of ELECTRICAL ENGINEERING, Feb. 26th, p. 124, Mr. A. H. Senbrook (General Manager, Marylebone Electric Supply) writes to us stating that the method of assessment referred to is based on negotiations between Mr. Jennings (Secretary and Accountant, Marylebone Electric Supply) and the Inland Revenue Authorities three years ago, and a large number of municipal electrical undertakings have taken advantage of the decision.

**Street Lighting.**—An experimental installation of nine half-watt lamps is to be made.

**Southport: New Tariff.**—The proposed new tariff has been modified by a slight increase in the fixed charges on the rateable value of premises, and the further rate is to be 3d. instead of 3d. per unit.

**Stirling: Electricity and Tramways Undertaking.**—We have reported from time to time with regard to an offer by Mr. George Balfour to purchase the Council's tramways and electricity undertaking, and of the recommendation to the Council not to accept it. Mr. J. A. Robertson, Burgh Electrical Engineer at Greenock, and Mr. Peter Fisher, General Manager of the Dundee Corporation Tramways, who have been advising the Council, have now prepared a supplementary report in which they point out that experience has shown that in nearly all cases it is a mistake to allow important public services to fall into the hands of companies, so far as individual local districts are concerned. This stricture they do not apply to large power companies operating in the areas of many local authorities. The report emphasises the point raised in the previous reports to the Council that it will be unwise to sell the undertaking.

**Stockport: Half-Watt Lamps.**—In view of the recent introduction of the half-watt lamps, the Electricity Committee has deferred considering a reduction in the price of current to long-hour lighting consumers.

**Waterford (Ireland): Electricity Supply.**—The Board of Trade has held an inquiry into the application of the Corporation for a provisional order for the supply of electric light and power.

**Worcester: Rateable Value System.**—The Electricity Committee's recommendation to adopt a rateable value system of charging on the basis of 15 per cent. of the rateable value and 3d. per unit discount, according to the time the account is paid, has been adopted. The use of the maximum demand system is to be abandoned.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**British Insulated & Helsby Cables.**—A final dividend of 9s. per share, making a total of 13 per cent. for the year, is recommended. An increase in profits of £28,956 is reported.

**Folkestone Electricity Supply.**—A final dividend, making 7 per cent. for the year, is to be paid.

**Harrow Electric Light and Power.**—A dividend of 5 per cent. is to be paid on the ordinary shares, in addition to the preference dividend. At the meeting a 14 per cent. increase in output was reported, the figure being now 526,201 units. This included increase in the lighting as well as the heating and cooking load.

**Hove Electric Lighting Co.**—At the meeting of the Company, which was the last before the taking over of the undertaking by the Corporation, a final dividend, making 9 per cent. for the year, was declared.

**London and Suburban Traction Co.**—An issue of £350,000 five per cent. "A" debenture stock is being offered at 92 per cent. This company was incorporated in 1912 to consolidate the interests of the Metropolitan Electric Tramways, the M.E.T. Omnibus Co., and the London United Tramways, and has shares also in the South Metropolitan Electric Tramways and Lighting Co., and the Gearless Motor Omnibus Co.

**Midland Electric Corporation for Power Distribution.**—The revenue during the last year has increased by £10,500, and the year's profit was £38,062. After paying debenture interest and providing for depreciation, £3,573 will be carried forward, but no ordinary dividend will be paid.

**Newcastle Electric Supply Co.**—At the annual meeting it was decided that the undertaking of the County of Durham Electrical Power Distribution Co. be acquired by the Company.

**North Metropolitan Electric Power Supply.**—A dividend of 6 per cent. for the year, with a bonus of 12s. per share, is declared. A further issue of £100,000 6 per cent. cumulative preference stock is being made.

**Oxford Electric Co.**—A dividend at the rate of 7 per cent. on the ordinary shares, and 5 per cent. on the preference shares, is to be paid.

**South Metropolitan Electric Light and Power Co.**—An issue of £25,000 six per cent. cumulative second preference shares is to be made at par. Applications by March 24th.

**The Mirrlees Watson Co.**—A dividend of 5 per cent., with £5,503 carried forward, is recommended. Last year a dividend of 10 per cent. was paid, with a bonus of 5 per cent.

**Vickers.**—After placing £300,000 to reserve, a final dividend of 1s. 6d. per share, making 12½ per cent. for the year, is to be paid. A scheme will be proposed at the meeting to increase the ordinary share capital by £1,110,000, the shares to be offered to existing shareholders at 28s. per share.

## SUMMARY

THERE was a conference between the London Electrical Masters' Association and representatives of the Electrical Trades Union last week; the Union still hold out for a further  $\frac{1}{2}$ d. an hour wages, and object to a clause in the masters' rules to the effect that they should work peaceably with non-union men. The masters are to give their definite decision to-day, but it is unlikely that they will make further concessions; in that event the Union threaten to call out the wiremen on strike. (Page 174.)

An investigation into the fluctuations of candle-power of incandescent lamps on alternating current circuits, shows that by winding the filament into a tight helix, as is done in the "half-watt" lamps, this effect is practically negligible. (Page 175.)

A DISCUSSION on electric vehicles at last Thursday's meeting of the Institution of Electrical Engineers was opened by Mr. F. Ayton. During the evening some details of the electric vehicles used by the London Fire Brigade were given by Lieut. Sladen. (Page 175.)

The design of discharge resistances for use in breaking the circuit of brake magnets is dealt with in our Questions and Answers columns. (Page 176.)

The successful cottage lighting scheme in use at Wednesbury is described by Mr. W. Fennell. The average inclusive charge for the unrestricted use of three lights is 7 $\frac{1}{2}$ d. per week, payable in advance. (Page 177.)

A LETTER refers to the existence of more than one glassworks where lamp bulbs are made in this country. (Page 177.)

A SCHEME of goods traffic by tramway is proposed at Liverpool. (Page 177.)

THE grant of a patent to Westinghouse Metallfaden Glühlampenfabrik for a process of manufacture of ductile tungsten filaments has been refused. The grant of a patent to E. A. Graham and W. J. Ricketts for a system of private telephones has been allowed, although opposed. An important patent relating to submarine telegraphy, by S. G. Brown and A. L. Dearlove expires to-day after a full life. Among the specifications published last week was one by Siemens & Halske dealing with the provision of gases at low pressure in incandescent lamp bulbs, and one by Siemens-Schuckertwerke for an arrangement of coupling-rod drive for rail vehicles. (Page 178.)

THE Marconi magnetic detector has been objected to by the United States authorities as not sufficiently sensitive for ship work. (Page 177.)

SOME new patterns of searchlights and half-watt lamp fittings are described, and a church lighting installation is illustrated in our Trade Section. (Pages 179 to 182.)

AN oil engine generating set is required for Egypt, a condensing pump for Marylebone. Loans have been sanctioned by the Local Government Board at Rochdale and South Shields, and by the L.C.C. at Woolwich. (Page 183.)

A HOUSE of Lords Committee has refused to grant certain extensions to the area of supply at Newport. Electric supply schemes are under consideration at Barry, Colwyn Bay, Connah's Quay, Crowle, and Wye. A profit-sharing scheme is proposed at Hampstead. (Page 184.)

**Foreign Lamps and the L.C.C.**—As reported in our last issue, the Stores and Contracts Committee of the London County Council recommended the acceptance of Pope's Electric Lamp Co.'s tender for metal filament lamps. The specification in question was for lamps with filaments "other than drawn." The Committee's report recommending the acceptance of this has now been withdrawn, in rather peculiar circumstances. It appears that forty-six firms were invited to tender. Pope's Electric Lamp Co.'s tender was not the lowest; there were two tenders lower than this, both for foreign-made lamps. The lowest of these was for lamps which the Committee stated "are not satisfactory." In the case of the second lowest tender (that of the Electric Lamp Supply Co., Ltd.) and the tender of Pope's Electric Lamp Co. the lamps had been tested with satisfactory results, and although Pope's Electric Lamp Co.'s tender was 11 per cent. higher than the other one, it was recommended for acceptance, as the lamps were British-made. An amendment was put down by Mr. Lewis that the tender of the Electric Lamp Supply Co., Ltd., be accepted instead of that for Pope's lamps, but instead of the matter having been debated as it should have been in the ordinary course at Tuesday's meeting of the Council, the Committee's report has been withdrawn, as stated above.

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MARCH 26TH.

*Institution of Electrical Engineers.*

8 p.m. "Current-limiting Reactances on Large Power Systems," by K. M. Faye-Hansen and J. S. Peck.

*Society of Dyers and Colourists.*

8 p.m. At The Dyers' Hall, Dowgate Hill, E.C. "Illumination in Connection with the Textile Industries," by Leon Gaster.

FRIDAY, MARCH 27TH.

*Physical Society of London.*

5 p.m. At Imperial College of Science, South Kensington. Among the Papers down for reading are "A New Type of Thermogalvanometer," by F. W. Jordan, and "An Experiment with an Incandescent Lamp," by C. W. S. Crawley.

*South-Western Polytechnic Institute.*

8 p.m. Presentation of Prizes and Certificates to Evening and Day Students by the Lord Chelmsford, G.C.M.G. A conversation follows.

*Royal Institution of Great Britain.*

9 p.m. "Improvements in Long Distance Telephony," by Professor J. A. Fleming.

SATURDAY, MARCH 28TH.

*Association of Mining Electrical Engineers: Warwickshire and South Staffordshire Branch.*

5.30 p.m. At Imperial Hotel, Birmingham. Discussion of "Breakdown of a D.C. Motor Armature," by F. Church, and "Electric Winding," by James Gillespie.

MONDAY, MARCH 30TH.

*Royal Society of Arts.*

4.30 p.m. "The Oil Resources of the Empire," by Dr. F. Mollwo Perkin.

*Institution of Electrical Engineers: Newcastle Students' Section.*

7.30 p.m. At Armstrong College. "Points on the Lay-out of a Static Sub-station." By W. Dixon.

TUESDAY, MARCH 31ST.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Manchester Municipal School of Technology, Annual general meeting.

*Institution of Civil Engineers.*

8 p.m. The Paper by T. G. Gribble, "Comparative Economics of Tramways and Railless Electric Traction," will be further discussed.

*Wireless Society of London.*

8 p.m. At Institution of Electrical Engineers. Discussion on Telephone Receivers, to be opened by H. J. Lucas.

WEDNESDAY, APRIL 1ST.

*Dynamicals.*

7 p.m. At Trocadero Restaurant. Anniversary meeting to be followed at 7.30 p.m. by the Anniversary Dinner. Mr. Robert Hammond in the chair.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. "Automatic Pressure Regulators," by A. Arnold and E. L. M. Emtage.

THURSDAY, APRIL 2ND.

*Institution of Electrical Engineers.*

"The Signalling of a Rapid Transit Railway," by H. G. Brown.

### The London Electrical Engineers.

Headquarters (46 Regency Street, S.W.) open Sats. till noon.

Rating Exam. for all Cos. from 7 to 10 p.m. every Wednesday.

Easter Camp will be at Cliffe Fort, near Gravesend, from April 9th (parade at Headquarters at 11 a.m.) till April 18th. Camp cards must be sent in at once.

(TO-DAY) THURSDAY, MARCH 26TH, C. Co. FRIDAY, MARCH 27TH, D. Co. MONDAY, MARCH 30TH, A. Co. TUESDAY, MARCH 31ST, B. Co., Tech. Inst., 7 to 10 p.m. Min. Range, 7 to 9 p.m. WEDNESDAY, APRIL 1ST.—Recruit Instruction, 7 to 10 p.m.

## THREATENED STRIKE OF ELECTRICAL WORKERS

LAST Thursday the members of the London District Committee of the Electrical Trades Union met the London Electrical Masters' Association to discuss with them the new working rules issued by the latter body and published in ELECTRICAL ENGINEERING of March 12th. The men repeated their demand for 11d. an hour wages, objected to the rule to the effect that Union men should work peaceably with non-Union men (the so-called "disability" clause), and also objected to the new grade of pipe-fitter. The masters are considering the men's demands and will give their answer to-day. On Friday there was a meeting of the Electrical Trades Union to hear the report of the deputation, and the following resolution was unanimously adopted:—

"That this mass meeting of London members of the Electrical Trades Union instructs the District Committee and the Execu-

tive Council to await the reply of the employers on Thursday, March 26th, and that the Executive Council immediately write to the London Electrical Masters Association that, unless a favourable reply to their application is received by that date, our London members will cease work; further, that an aggregate meeting be called for the members to give a final decision on the employers' terms before a strike is declared."

It will be seen from the above resolution that the masters were informed that the men would strike unless their demands are agreed to, but on the other hand the men have not yet really definitely determined that they will do so, for there is to be another aggregate meeting of the Union to discuss the employers' terms before a strike is declared. It seems hardly conceivable that the employers will grant further concessions, and we trust, therefore, that the counsels of the more moderate of the workmen will prevail. A strike for a further increase of ½d. an hour when an increase of 1d. has just been granted would be very unwise from the workmen's own point of view, and it would probably result in a large number of the new recruits leaving the Union in disgust. Moreover, unless the Union has become suddenly very rich, it would be suicidal policy to declare war with the masters on the "disability" clause.

Mr. L. G. Tate, Secretary of the London Electrical Masters' Association, has sent the following letter to the Editors of the *Daily Mail*, *Daily Chronicle*, *Daily Express*, *Evening News*, and *Star*:—

The Electrical Trades Union at the end of last year asked for a rise of wages from the recognised rate of 9d. or 9½d. per hour, and the masters at the end of February decided to grant an increase to 10d., dating as and from the first pay-day in April, and 10½d. as and from the first pay-day in July, together with sundry concessions as to travelling expenses and travelling time, but making a proviso that there should be no exception taken either on the part of the men or employers as to the employment of non-union men either in the electrical trade or any other trade with whom the men may be working.

The Electrical Trades Union will not agree to this latter clause, and are threatening a strike if the wages are not increased to 10½d. after the first pay-day in April, and 11d. in July.

I wish to point out to you that at least 75 per cent. of the electrical wiremen are employed throughout the year at a full week's work of 50 to 56 hours, according to the firm with whom they are employed, and taking the rate at even 10½d. an hour on a 53 hour week, their earnings work out at £2 6s. 4½d. per week.

Carpenters and bricklayers, who are now in receipt of 11½d. an hour when working on buildings, can only work 50 hours for 35 weeks, and 44 hours for 17 weeks, as a maximum, and where the weather interferes with them their hours are considerably less. Taking the above hours, however, they can only earn £2 2s. 2d. for 17 weeks in winter, and £2 7s. 11d. for the 35 weeks in the summer (averaging £2 6s. 1d. per week all through the year), so that the electrical wireman at 10½d. an hour is better paid than the carpenter or bricklayer at 11½d.

I think if these facts were realised by the men, and especially by their wives, they would not be in a hurry to jeopardise their jobs for the difference of ½d. per hour, and I appeal to you on behalf of the wives and families of such men to give these facts as full publicity as you possibly can.

At Liverpool the Electrical Trades Union is also active, and it is stated that a large proportion of the wiremen there are members of it. The Liverpool wiring contractors have therefore decided to follow in the footsteps of the London masters in forming an association of electrical employers. At a meeting held last week over 100 were present, and it has been decided to meet again to-day to elect officers and to discuss rules. The standard rate of wages for wiremen in Liverpool is now 9½d. per hour, and the men, it is said, are asking for an increase of 2½d., and a reduction of the working hours from fifty to forty-six and a-half a week. For night shifts they ask one hour less work (or the hour at overtime rate), they demand that the dinner-hour should not be movable, except at overtime rates, an extra 1d. an hour for charge hands, and an extra 1s. a day for "dirty" work.

**The Utilisation of Solar Energy.**—Mr. A. S. E. Ackermann is to read a Paper before the Society of Engineers on the utilisation of solar energy, embodying the results of trials by him of an installation of engines using sun-produced steam. The plant tested has cost some £30,000, the investigations cover nearly four years, and though many experiments with sun power have been made during the last 50 years, this is the first paper of its kind. The meeting is to be held at the Institution of Electrical Engineers on Monday, April 6th, at 7.30 p.m.

## THE FLICKER OF INCANDESCENT LAMPS ON A.C. CIRCUITS

THE question of the flicker of incandescent lamps, with special reference to "half-watt," or nitrogen-filled, incandescent lamps, is dealt with by Dr. Irving Langmuir in the March issue of the *General Electric Review* (Schenectady). The author shows that the flicker which occurs when low-watt incandescent lamps are run on low-frequency A.C. circuits is inversely proportional to the frequency of the A.C. supply, and directly proportional to the power consumption. The introduction of gases into lamps therefore tends to an increase in the fluctuation, since it increases the power consumption at any given temperature. On the other hand, winding the filament into a tight helix tends to a decrease, since it decreases the ratio of power to mass of filament.

The following equation giving the flicker is arrived at:  $F = 20,000 w_0 / f m T^2$ , where  $w_0$  is the heat dissipation from the filament in watts, at the average temperature of the filament,  $f$  is the A.C. frequency,  $m$  is the mass of the filament, and  $T$  is the instantaneous absolute temperature on the centigrade scale. In ordinary tungsten lamps the loss of energy from the filaments is almost entirely by radiation, and, as the power consumption is approximately proportional to the 4.7 power of  $T$ , the candle-power fluctuations increase approximately with the 2.7 power of  $T$ . Where the efficiency is 1 watt per c.p. the filament temperature is about 2,400° C., and the consumption about 0.54 watt for a filament 1 mil in diameter. The mass of this piece is 0.098 mg. By substituting these values the following formula is deduced:  $F = 19.2 / d$ , where  $d$  is the diameter of the filament in mils. This is further reduced to  $F = A / f i$ , where  $A$  is a constant, having a value depending on the efficiency (watts per c.p.) at which the filament is run, and  $i$  is the instantaneous current—the current necessary to maintain a filament at 2,400° C. is 0.197 d<sup>1</sup> amperes, where  $d$  is the filament diameter in mils. At 1 watt per c.p. the value of  $A$  is 6.48, rising to 10.56 at 0.5 watts per c.p. The effect of helically winding the filaments is to decrease the ratio,  $w_0 : m$ , and therefore the candle-power fluctuation, the greatest possible reduction being  $\pi : 1$ . Ordinarily, however, under practical conditions the reduction is about 1.4 : 1. With the filaments in gas, however, the effect is much greater than in a vacuum, for not only the radiated energy, but also the heat carried away from the filament by convection is reduced by its concentration. In general, for a filament of any given diameter in a given gas,  $F$  will be given by an equation of the form  $F = \beta / f$ , where  $\beta$  represents a constant divided by the frequency of supply and the diameter of the filament, and multiplied by the ratio in which the power is increased by the presence of the gas. From this the value of  $\beta$  can be prepared for different conditions, and the results have been tested by direct measurements of instantaneous candle-power. The following tables which have been prepared are of interest as showing how small are the fluctuations in nitrogen-filled lamps:—

FLUCTUATIONS OF C.P. FOR 110-VOLT TUNGSTEN LAMPS WITH EXHAUSTED BULBS.

Watts.	Amperes.	Watts per Candle.	F.		
			25 Cycles.	40 Cycles.	60 Cycles.
10	0.091	1.30	1.08	0.68	0.45
15	0.136	1.25	0.87	0.54	0.36
20	0.182	1.17	0.72	0.45	0.30
25	0.228	1.14	0.64	0.40	0.27
40	0.363	1.10	0.48	0.30	0.20
60	0.545	1.07	0.37	0.23	0.15
100	0.91	1.02	0.27	0.17	0.11
150	1.36	0.90	0.22	0.14	0.09
250	2.27	0.90	0.16	0.10	0.07
500	4.55	0.90	0.10	0.06	0.04

FLUCTUATIONS OF C.P. FOR NITROGEN-FILLED LAMPS WITH HELICAL FILAMENTS.

Amperes.	Watts per Candle.	F.		
		25 Cycles.	40 Cycles.	60 Cycles.
3.0	0.9	0.25	0.15	0.10
5.0	0.7	0.14	0.08	0.06
6.6	0.6	0.11	0.07	0.05
10.0	0.55	0.08	0.05	0.04
20.0	0.40	0.06	0.03	0.02

If the values of  $F$  be multiplied by 100, the result will express the candle-power fluctuation directly in per cent.

## ELECTRIC VEHICLES

THE discussion on "Electric Battery Vehicles," held at last Thursday's meeting of the Institution of Electrical Engineers, was opened by Mr. F. Ayton (Borough Electrical Engineer, Ipswich), who is Secretary of the Electric Vehicle Committee appointed by the Incorporated Municipal Electrical Association, with some very optimistic remarks. He pointed out that great improvements had recently been made in batteries, chassis construction, and tyres, and for inter-urban and suburban work where the mileage limit per charge was not a drawback he saw a great future, especially for the commercial electric vehicle. The lighter cars could generally accomplish fifty to sixty miles on one charge, but by a short boosting during the driver's dinner-hour, the daily run could be appreciably increased. He referred to the large number of electric cars in use in America, and summed up their advantages in steadiness, silence, and freedom from smell; and in considering charging arrangements, spoke of the standard charging plug recommended by his Committee, and suggested that regulation of charging boosters to shut down automatically when the voltage of the battery had risen to the value corresponding to a full charge was desirable. In view of the vested interests in petrol vehicles it was necessary for an active campaign to be carried on by central station engineers and electric vehicle manufacturers.

Mr. J. W. Beauchamp then spoke of the six electric vehicles running at West Ham, where 1d. per unit was charged, and the average revenue to the electricity department was £20 per annum. The movement would be much facilitated if some scheme for hiring out commercial electric vehicles could be started, and he believed that this could be done at a much less cost than with steam lorries. Mr. R. J. Mitchell (Edison Accumulators, Ltd.) thought that 1d. per unit should be the charge for current, and looked upon the electric vehicle as a competitor of the horse rather than the petrol or the steam van.

One of the most interesting speeches was that of Lieut. Sladen, chief of the London Fire Brigade, who gave particulars of the electrically-propelled life-saving appliances adopted as standard by the L.C.C. These had had batteries of 84 cells with a capacity of 200 ampere hours at the 6-hour rate. The total weight of the vehicle, which was driven by gearless hub motors, was 5½ tons complete with men, or about 5 cwt. heavier than a similar petrol vehicle. The contract speed was 25 miles per hour, but this could be exceeded on the level, and a gradient of one in nine could be taken at 15 miles per hour with the circuit-breaker set at 250 amperes. These vehicles cost 1s. per mile to maintain (not including driver's wages, interest, or depreciation), as compared with 1s. 3d. for a similar petrol vehicle. The total annual cost, including depreciation, &c., was about the same for both, or £150, of which £40 was for repairs (including battery renewals) in the case of an electric escape van running 800 miles per annum. The batteries ran 6,000 miles before requiring renewal. There was some difficulty in obtaining a suitable charging voltage from supply authorities. In his experience, for life-saving appliances the electric vehicle was very satisfactory. With a fully-charged battery, it was at its best when starting out, which was not the case with either petrol or steam, and a turn could be made in seven to eight seconds against a minimum of 15 seconds for a petrol vehicle.

Among other speakers, Mr. P. A. Mossay referred to the less wear of tyres caused by electric driving, and showed some views of large fleets of Lloyd electric cars on the Continent. Dr. Porter (Medical Officer of Health, Marylebone) defended the electric car from the hygienic point of view, and Mr. C. Barber expressed the view that for trips under 50 miles electric commercial vehicles cost 20 per cent. less than petrol vehicles. He admitted, however, that most published figures were unreliable. Mr. A. B. Pescatore claimed that an electric chassis, apart from the battery, should last twice as long as a petrol chassis, and put the total working expenses for 2½ to 5 ton vehicles at 14d. to 3½d. per mile. Such figures had been obtained in the Brighton omnibuses, which, he said, consumed 110 to 140 watt-hours per ton mile on hilly routes. Mr. A. Fox said that there was no engineering difficulty in designing a vehicle to run 100 miles on one charge if this was justified economically. Mr. H. Brazil gave some particulars of the control system of a 4½ ton lorry with a 260-ampere-hour battery, which ran at 9½ miles per hour on the level, with a consumption of about 1.3 units per mile. The large number of controller stops, obtained by subdivision of the battery, tended to keep the load factor of the battery high. Mr. Brazil also described the battery discharge meter designed by himself and Mr. F. Lydall, of which details were given in *ELECTRICAL ENGINEERING*, Vol. VIII., page 277.

Some interesting figures of watt-hours per car mile for various sizes of Lloyd electric cars were given by Mr. A. J. Makower as follows:—5 cwt. van, 133; cab, 122; 1½ ton lorry, 80; 2½ ton lorry, 72.4; fire engine, 53.6. He also gave the following costs in pence per car mile for running a service of 100 cabs in a German town. The cabs weighed 2.4 tons, and averaged

90 miles per day each for 350 days in the year :—Battery, 0.99; current, 0.90; tyres, 1.87; driver, 1.56; repairs, 0.71; general, 0.63; depreciation, 0.33. The annual current bill on this system was about £11,500. Other speakers included Mr. A. E. Burgess, who recommended closer co-operation between battery makers and supply authorities, and Mr. W. E. Burnand, who amused the meeting with some experiences with an electric car. Mr. Shrapnell-Smith wound up the discussion with a warning to manufacturers and supply authorities against being too optimistic, and believing that they would begin to make money from the very commencement. As was the case in the steam and petrol car industry, they would have to be prepared to fight very considerable odds for the first few years.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,384.

A small wireless installation has been erected, which is working to a receiving station about a quarter of a mile distant; the signals can be heard with the receiver about two inches away from the ear. It is desired to fit up some sort of calling arrangement to enable the receiving station to be called up. This could take the form of a coherer, but, as this cannot be tuned to a given wave, a relay of some description is preferable so that it can take the place of the telephone when not receiving. Please suggest a suitable form of apparatus.—"CALL."

(Replies must be received not later than first post, Thursday, April 2nd.)

### ANSWERS TO No. 1,382.

A series wound 500-volt 50-h.p. crane motor is fitted with a shunt wound magnetic brake, and this is provided with a discharge coil to take the "kick" when breaking the circuit. State how the necessary resistance and current carrying capacity of the discharge resistance are arrived at, and give the rating of the resistance when working in conjunction with a one-hour rated motor. If the motor is compound wound instead of "series," could the kicking coil be dispensed with?—A. R. T.

The first award (10s.) is made to "BRAKE" for the following reply:—

Assuming that the discharge resistance fitted to this brake magnet is in parallel with it, the resistance would be the same as that of the magnet coils. Thus, supposing the magnet pulls 50 lb. through a stroke of 4 in., it would dissipate 200 watts on a 1-hour rating basis. This allows a maximum current of 0.4 amps. on a 500-volt circuit, and the resistance would therefore be 1,250 ohms. Continuously-rated resistances should certainly be supplied, since the weight of the resistance itself is extremely small compared with that of the magnet, and it soon attains its maximum temperature. Four spirals of resistance wire about 6 in. long and 1 in. diameter would meet the case, and would not allow of a greater temperature rise than 100°C. A discharge resistance would be as necessary with a compound-wound machine as with a series-wound one; but a rather better scheme would be to use a resistance in series with the coils. Most brake magnets are wound with two  $\frac{1}{2}$  coils, and in the case of a 500-volt circuit the coils are connected in series, so that by connecting in parallel we should only put 250 volts

across the coils; the remaining voltage could be absorbed by a resistance of 312 ohms (this being the resistance of two coils in parallel), and capable of carrying 0.8 amps. continuously. This has the effect of making the magnet less sluggish than would be the case with the resistance in parallel, and also the discharge voltage would be lower, as this depends solely upon the flux and the effective number of turns.

The second award (5s.) is made to "L. B.," who writes as follows:—

The h.p., size, or type of motor has no connection with the discharge resistance or the magnet. "Kick" discharge resistances are objectionable, because, on breaking circuit from the line, the self-induction of the shunt magnet winding causes an oscillating current surge (due to the induced E.M.F.) through the closed circuit path of the magnet and discharge. This tends to prevent the brake acting. If the magnet winding is sufficiently well insulated to withstand this inductive "kick," it is therefore preferable to do without the discharge resistance. In some cases this discharge resistance is permanently in parallel with the magnet, with its attendant constant watt loss. Often standard shunt brake magnets are wound in two separate coils, and if so in this case, then by placing the two halves in parallel instead of series, but with a resistance in series to keep the total ampere-turns and watts on coil the same as before, the inductive effect is reduced. Sometimes the whole magnet is designed to withstand the "kick" up to 250-volt circuits without any discharge path, and when used on higher voltages a series resistance is inserted permanently. A compound-wound magnet coil could be successfully used, the series winding being designed to do most of the pull, with the shunt winding to rely upon to hold the brake when operated independent of the varying load on the motor. The total number of turns would thus be so small in comparison with the shunt winding, that the induced E.M.F. on opening circuit would be harmless, and it has the advantage that less watts would be consumed. A copper tube over the plunger also considerably reduces the inductive effect, as the energy is largely dissipated in the closed tube circuit.

The theoretical calculations to determine the inductive rise are extremely involved, especially with a circuit possessing variable permeability.

In its simplest form the inductance  $L = \frac{\phi N}{C \times 10^8}$  in henries, and is numerically equal to the E.M.F. in volts induced by a current changing at a rate of one ampere per second. Therefore this

$$\text{E.M.F.} = L \frac{C}{T}$$

where  $\phi$  = total lines of force,

$N$  = number of turns on winding,

$C$  = current in amperes,

$T$  = time in seconds for this E.M.F. to die down to zero and is unknown.

The current and flux depend, of course, entirely on the induced E.M.F. (For further information see "Solenoids and Electromagnets," by Underhill.) For practical purposes, in this particular case, it is absolutely safe, if the discharge resistance is designed to carry the normal magnetising current for a period of ten seconds without overheating, and with an ohmic value four times that of the magnet winding.

**Association of Supervising Electricians.**—An association of managers, supervising engineers, and permanent foremen attached to the electrical contracting trade has been formed. The objects of the Association are (a) to assist members in obtaining information of situations, (b) to form a technical library for the use of the members, (c) to form a benevolent fund for the assistance of members in distress, (d) to endeavour, by means of lectures and visits to large works, to maintain a high standard of efficiency of all members; (e) to foster the apprentice system for learners in the electrical trade, (f) to endeavour to extend the attendance of electrical workers to evening schools, both technical and practical; (g) to arrange the reading of papers on electrical subjects by members or visitors, invited from other societies, and (h) to arrange periodical social gatherings to promote knowledge and good fellowship amongst members. The subscription to the Association has been fixed at 2s. 6d. per quarter, and the entrance fee at 5s. At the preliminary meeting at which the formation of the Association was decided upon, it was agreed that, in order to become members, foremen or supervising engineers would have to have been employed in the electrical contracting trade a certain time, during part of which they must have been actually acting as foremen or supervisors of work. The Hon. Secretary of the Association is Mr. Charles J. Banister, 14 Pulborough Road, Southfields, S.W., who will be pleased to give full particulars to any intending members.

## COTTAGE LIGHTING

THE lighting of cottages by electricity at a fixed weekly charge was the subject of a Paper, by Mr. W. Fennell, read on March 25th, before the Birmingham Section of the Institution of Electrical Engineers. The scheme described has been tried with great success at Wednesbury. In developing the demand for electricity in the usual way most of the larger houses—these are outside the town—and shops were soon connected. Reduced rates for licensed premises brought almost all these on the mains, and the smaller shops followed when a free-wiring scheme was introduced; but not even this, coupled with a rateable-value system of charge, or slot meters, induced the £8 to £18 householder generally to take a supply. The following scheme, however, enabled the poorer classes, renting cottages at 8s. to 4s. per week, to be reached. The houses are in blocks, and one service will supply from five to fifteen houses. A 7/18 S.W.G. service is terminated in a service fuse in the most convenient house. Space is allowed for fixing a meter. It has been found that the cost of service averages 15s. per house, against the ordinary service cost for a few lights of about £3 8s. Each house is provided with a wall plug socket, which takes the sub-service wire; the plug itself is connected by flexible to a pair of bow cut-outs. From this point the wiring is quite ordinary. The cost of this, with fittings, but without lamps, averages £1 10s. to £1 13s. 6d. per house. A local switch is at present allowed for each light, but the substitution of key-holders is being considered. Whether the extra consumption is of more importance than the reduced cost of wiring is not yet known. Three lamps are supplied: two are 40-watt metal-filament lamps, for the downstairs rooms, and one an 8-c.p. carbon lamp, for the front bedroom. Contrary to expectation, no demand is found for light in the other bedrooms. To prevent any but authorised lamps being used, Edison screw-caps and lamp-holders are adopted. This is quite effective, as lamps with this cap cannot be bought in small quantities, while there is no extra expense for either holder or lamp, because it is the Continental standard. Only the two sizes of lamp are stocked at the works.

It was estimated that an average rental of 7½d. per week would easily cover the cost, as the cost of supply, including all charges, is £7 per kw. of maximum demand, plus 0·35d. per kw.-hour. Owing to the absence of a meter, a certain amount of waste was allowed for, and six hours' use of the maximum demand per night throughout the year was assumed. It was further assumed that the average maximum demand, between 4 and 5.30 p.m., would be 50 watts, but this is higher than has occurred in practice. It has been found that 108 lamps per 100 houses are, on the average, in use between 4.45 and 5.30 p.m. However, later on this is increased, but by that time the power load is off. Based upon a peak-load demand of 45 watts per house, and a six hours' use of this per day, the annual consumption is 100 units. The cost of supply is 5s. 6d. per annum for the standing charges, and 2s. 11d. for the energy consumed, or a total of 8s. 5d. The revenue at 7½d. per week amounts to £1 12s. 6d. per annum. The 7½d. per week average income is obtained as follows:—June and July, 5d.; May and August, 6d.; April and September, 7d.; March and October, 8d.; February and November, 9d.; January and December, 10d.; so that consumers start taking current on a fair basis at any time. Collection is carried out on a commission basis, which has been found to be satisfactory. A collector working insurance or other business is engaged, and he knows how to deal with these consumers. Payment is made in advance on the Monday or Tuesday, and the consumer is liable to be cut off on the Monday following a failure to pay. The scheme has grown from an experimental twenty-five consumers to 250 within eighteen months, without any canvassing or pushing. The price of gas is 1s. 11d. per 1,000 cub. ft. It has also been found that the arrears keep fairly steady, and average about one week's rental. Lamp breakage came out at under one lamp per socket per annum. Not more than 2 per cent. of permanent disconnection has occurred. Even with fairly lenient treatment, bad debts have not exceeded 1 per cent. The sense of fairness existing in the working class, coupled with the weekly visits of the collector, have been found to prevent waste. After paying all charges, a surplus of 15s. 6d. per consumer is obtained. Taking 8s. of this, the entire cost of wiring can be written off in four years. The author concludes:—"A net profit of 7s. 6d. per annum per consumer, or about 25 per cent. of the income, after paying all expenses, is a far better return than can be shown on any other class of consumers. Putting it another way, 1 kw. of maximum demand produces a profit of over £9 per annum,

and over double that sum after three years, while many of the ordinary consumers barely produce a gross income of £9 per kw. of the peak demand."

## CORRESPONDENCE

## STRIKE OF BULB MAKERS.

To the Editor of ELECTRICAL ENGINEERING.

DEAR SIR,—We notice on page 171 of your journal, under the heading "Strike of Osram Bulb Makers," the following words: "At the Lemington Glass Works, near Newcastle, which are connected with the Osram Lamp Works, manufacture the glass bulbs for Osram and Robertson lamps, and are the only works of this character in England, some new machines were introduced a few months ago for opening and closing the moulds into which the bulbs are blown."

We should like to point out that our Glass Works here, where the glass bulbs for Royal Ediswan Lamps are made, are the oldest works of the kind in this country.

Yours faithfully, for the Edison & Swan  
United Electric Light Co., Ltd.,  
C. E. HUNTER (Director).

Ponder's End, Middlesex, March 23rd, 1914.

## ELECTRIC TRACTION NOTES

The Liverpool Tramways Committee is entering into negotiations with the South-West Lancashire Tramway Companies with regard to the inauguration of a tramway goods service between the Liverpool docks and the Lancashire towns of Bolton, Bury, Rochdale, &c. The idea is to inaugurate a small tentative service of tramway wagons with possibly one or two trailers. If successful the scheme would be considerably extended.

The reports of several London tramway companies have been issued. The London United Tramways report a balance of £14,600, after placing £20,000 to renewals, of which £12,500 is recommended to be used for the payment of a 1 per cent. dividend on the preference shares, with the remainder carried forward. The Metropolitan Electric Tramways have an available balance of £52,282, and a dividend of 3 per cent. on the ordinary shares is recommended in addition to the preference dividend. The London and Suburban Traction Co., which holds shares in the above and other London traction concerns, including motor-bus undertakings, reports a balance of £88,252, and pays a 5 per cent. dividend on the preferred shares only.

**Society for Electrical Development.**—Recently an organisation called the "Society for Electrical Development," was brought into being in the United States. The objects are general, co-operative, public educational work, but it was decided that, before a start was made, a fund of \$200,000 (£41,500), should be subscribed. This amount was reached a few weeks ago, and on March 1st the Society took in hand the task of educating the public to "do it electrically." A national advertising campaign will probably be started at a near date. According to the *Electrical World* (New York), the membership on February 26th was 1,300, apportioned as follows: Central stations, 279; manufacturers, 173; contractors, 568; jobbers, 262; and miscellaneous, 18.

**Association of Engineers-in-Charge.**—The nineteenth Annual Dinner of this Association was held on Saturday at the Holborn Restaurant, and about 300 members and guests were present. Dr. R. T. Glazebrook, C.B., F.R.S., the President, was in the Chair. The toast of Science, Practice, and Technology was proposed by Mr. A. B. Raworth, and responded to by Sir Alfred Keogh, K.C.B. Mr. E. Penn, the Hon. Secretary of the Association, gave the health of the guests and kindred institutions, to which Mr. Leslie T. Robertson and Sir Thomas Pile, Bart., replied. Finally, the Association was proposed by Sir Boverton Redwood, Bart., and responded to by Dr. Glazebrook.

**U.S. Naval Collier "Jupiter."**—The trials of this vessel have just been completed off the Lower Californian Coast. An average speed of 15·1 knots was maintained for 48 hours, says the *Electrical Review* and *Western Electrician* (Chicago). The propeller speed was 115·7 r.p.m., and 6,940 h.p. was there developed. This performance is said to exceed that of the similar ships *Cyclops* and *Neptune*. The former is fitted with reciprocating engines, and the latter with geared turbines. The equipment of the *Jupiter* was described in ELECTRICAL ENGINEERING for August 29th, 1912, page 481, and has been referred to from time to time.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published March 19th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

*Names in italics indicate communicators of inventions from abroad.*

1,775/13. **Negative Arc Lamp Carbons.** H. AYRTON. A central core of hard carbon is surrounded by a shell, burning more easily. A closely adhering copper coating is provided. Three figures.

5,763/13. **Governing Speed of Engines at Sea.** A. W. FITHIAN. By means of a gravity controlled rheostat an electromagnet, whose core is attached to the moving part of a balanced throttle valve, gradually, by the motion of the ship, controls the valve. One figure.

14,380/13. **Dynamo and Motor Windings.** SIEMENS DYNAMO WORKS (*Siemens Schuckertwerke-Ges.*). Stranded conductors are reinforced by a bar, sheath, or some of the strands sweated together. Nine figures.

15,284/13. **Dischargers for Wireless.** W. J. MELLERSH-JACKSON (*Signal-Ges., Germany*). Condensers are charged and discharged by arranging the regularity of the discharge spark in correspondence with successive single alternations, or groups, of the A.C. current by inserting in the charging circuit an inductance, the value of which varies in synchronism with the alternations. One figure.

17,416/13. **Incandescent Lamps.** SIEMENS & HALSKE A.-G. Where a chemical compound is used in the bulb for the purpose of giving off gas, this is arranged to be heated by a special wire in series or parallel with the filament, e.g., it may be wound round a tube containing the compound. The wire is of such material that its cross-section decreases with time and therefore runs hotter, thus tending to maintain the quantity of gas evolved constant as the amount of the chemical left decreases.

19,517/13. **Polyphase Commutator Motors.** E. F. W. ALEXANDERSON. A standard drum compensating winding is connected in series with one of the supply leads. The arrangement is useful in connection with the speed control of an induction motor by a commutator motor in cascade. One figure.

27,472/13. **Locomotives.** SIEMENS SCHUCKERTWERKE-GES. A motor or jackshaft is situated between two pairs of coupled driving wheels, and with its centre line above that of the driving wheels. Lugs at the ends of the coupling rods are connected to cranks on the motor or jackshaft by coupling rods parallel to the other coupling rods. One figure.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** SMITH and GARNETT [Cables] 7,311/13.

**Dynamos, Motors, and Transformers:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [Regulation] 30,107/12; BRAIN and LEECH [Insulating tanks for transformers] 8,591/13.

**Electrometallurgy and Electrochemistry:** TISCHENKO and PLAUSON [Conversion of carbon into liquid hydro-carbons] 27,430/12; JONES [Welding] 27,496/12; BUCHER [Fixation of nitrogen] 27,713/12; [Alkali metals] 139/13; MIES [Treatment of plants, &c.] 11,997/13; AUGUST SCHWARZ [Carbon electrode holders] 24,900/13.

**Heating and Cooking:** DALTON [Sad-irons] 12,246/13.

**Instruments and Meters:** SIEMENS BROS. (*Siemens & Halske A.-G.*) [Recording mechanism] 17,266/13.

**Storage Batteries:** DAVIES, 28,086/12; WORSNOP [Boxes] 15,411/13.

**Switchgear:** MORRISON [Motor controllers] 5,792/13; A.E.G. [Liquid-immersed switch] 10,077/13.

**Telephony and Telegraphy:** SIEMENS BROS. & Co. (*Siemens & Halske A.-G.*) [Selectors] 2,409/13; AUTO. TEL. MFG. Co. (*Auto. Elec. Co., U.S.A.*) [Impulse transmitters] 5,249/13; WESTERN ELEC. Co. (*Western Elec. Co., U.S.A.*) [Telephone exchanges] 5,654/13; STELJES & REBERT [Telegraph transmitters] 5,805/13; WESTERN ELEC. Co. (*Woodward*) [Power control for automatic switches] 20,591/13; LEE and HOGAN [Wireless] 24,458/13.

**Traction:** CLARK [Automatic wireless train control] 4,901/13; ALEXANDER (*Union Switch & Signal Co., U.S.A.*) [Group control of signals and points] 5,295/13; CROMPTON & Co. and BURGE [Regenerative control] 6,806/13; W. R. SYKES INTERLOCKING SIGNAL Co. and TARRANT [Locking mechanism] 8,153/13; SIEMENS DYNAMOS WORKS and DUKE [Automatic train control by separately actuated contactors] 8,624/13; DUPLOCK [Railway signalling] 21,967/13.

**Miscellaneous:** AHLEMEYER [Automobile movement indicator] 4,664/13; WHITE and GARDNER [Indicators for steam trains] 8,273/13; STRANGE and NEW BRIT. EVER READY Co. [Floral

decorations] 12,728/13; HITZELBERGER and NEW BRIT. EVER READY Co. [Lamps] 14,423/13; MASCH. OERLIKON [Oscillating motion produced electro-magnetically] 15,059/13; ELPHINSTONE [Ships' telegraphs] 15,556/13; LOWE [Battery regulators] 18,164/13; FILLERSDOBF [Alarm clock] 27,541/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems:** SHAW, 5,247/14.

**Dynamos, Motors, and Transformers:** A.-G. BROWN, BOVERI [Cooling] 14,941/13; HARTMANN [Maintaining vacuum in metal vapour rectifiers] 2,288/14.

**Ignition:** POHL E. & SIAL, 20,800/13; SPADA [Sparking plugs] 29,059/13.

**Switchgear, Fuses and Fittings:** CHAPMAN [Plug] 25,675/13; KEMP and LAURITZEN [Relays] 29,448/13; KREIDLER [Lamp-holders] 2,079/14; JESSEN [Throw-over switches] 4,447/14; AKTIEBOLAGET LUX [Flash lighting] 4,473/14 and 4,920/14; POLLAK [Interrupters] 5,070/14.

**Telephony and Telegraphy:** LAVERY [Telephony] 4,619/14; POLYPHOS ELEKTRIZITATS GES. [Wireless] 4,664/14; SHAW [Telephony] 5,246/14.

**Miscellaneous:** SENDLER [Pocket lamp with writing attachment] 16,742/13; H. ARON ELEKTRIZITÄTS ZÄHLERFABRIK GES. [Clocks] 26,631/13.

The following Amended Specifications may now be obtained:—

**Miscellaneous:** P. R. KEPPE and H. M. R. MADDOCK [Shaft rotation indicators] 3,878/12; J. C. CLARKE and CHADBURN'S (SHIP) TELEGRAPH Co. [Shaft rotation indicators] 9,673/12.

### Grant of Patents Allowed

8,040/12. **Variable-Speed Dynamos.** C. A. VANDERVELL and A. H. MIDGLEY. The Law Officer has, on Appeal, upheld the Grant of this Patent.

2,610/13. **Private Telephone System.** E. A. GRAHAM and W. J. RICKETTS. The Comptroller has decided that the Grant of this Patent, though opposed, be allowed.

### Grant of Patent Refused

3,162/13. **Ductile Tungsten Filaments.** WESTINGHOUSE METALLFADEN GLÜHLAMPENFABRIK. The Grant of this Patent, which was opposed by Siemens Bros. & Co. (ELECTRICAL ENGINEERING, Nov. 13th, 1913, p. 627), has been refused by the Comptroller.

### Opposition Entered to Grant of Patent

1,862/13. **Earthing Clip.** F. TOWNSON. A construction for an earthing clip to fit different sizes of cables and conduits is given.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

5,649 of March 26th, 1900. **Submarine Telegraphy.** S. G. BROWN and A. L. DEARLOVE. To facilitate relay working, the condensers in series with the relay are shunted by a high resistance. A main relay coil is attached to a heavy, damped auxiliary coil, adjusted to compensate automatically for any movement of the main coil caused by polarising of the condensers. For duplex working, a closed iron circuit transformer is connected across the arms of the bridge in place of the condensers.

6,034 of March 31st, 1900. **Automatic Fire Alarms.** G. H. OTTAWAY (*C. E. May, New Zealand*). A slack sagging strip or wire is so arranged that a gradual rise in temperature is compensated for by the supports, but a sudden rise causes a local circuit to be closed.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distribution Systems:** P. M. LINCOLN [Regulation of A.C. loads by a battery equipment] 25,967/07.

**Dynamos and Transformers:** W. SCHÄFFER [Rotary Converters] 26,762/07.

**Switchgear, Fuses and Fittings:** C. DE KANDÓ [Control of liquid resistances by compressed air] 26,966/02; J. Y. JOHNSON (*Elek. A.-G. vorm W. Lahmeyer & Co., Germany*) [Oil immersed fuse for high pressures] 26,380/03; A. J. BARLOW [Motor controllers] 12,508/08; C. H. PUGH, LTD., and G. F. BULL [Junction boxes] 26,252/08.

**Traction:** JOHNSON-LUNDELL ELEC. TRACTION Co. (*R. Lundell, U.S.A.*) [Series-parallel control; improvement in specification No. 7,979/99] 26,668/02; M. O. SPICKNALL and J. G. WHITE & Co. [Tramway track rail and conduit point tongues] 27,728/06.

**Miscellaneous:** T. HARDEN and AMALGALINE, LTD. [Aluminium solder] 26,932/07; F. MITCHELL [Indicating targets] 26,059/08; H. WANDREY [Bell indicators] 26,502/08.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The Washington Bureau of Navigation issued the following sweeping order to its wireless inspectors recently, according to the *Financier* on February 14th:—"A large number of range tests conducted by revenue cutters has conclusively demonstrated that the Marconi magnetic detector is not efficient under the Act of July 23rd, 1912. The tests have proved that signals are unreadable on the magnetic detector at a distance of 100 miles when the transmitter is of the usual 10-in. coil battery type and average ship antennas are employed. Masters and owners of vessels equipped with magnetic detectors only should be notified in writing of these facts, and should take steps promptly to secure satisfactory detectors. Instructions regarding reporting of violations in these cases will be forwarded later." Naturally this is not regarded with favour by the Marconi International Marine Communication Co. and the British Post Office. We understand also that the Foreign Office is taking up the matter. The International Co. has issued orders to commanders of all west-bound vessels for range tests at distances above 100 miles to be made, and the Manager of the International

Co. has started for Washington. The magnetic detector is known not to be the most sensitive, but is still, by most people, regarded as the most constant. It should be used in connection with the Marconi multiple tuner and a suitable aerial, and if these conditions were not fulfilled in the tests carried out by the U.S. revenue cutters, its true range and sensitiveness were not found. The tests now being made by actual cargo and passenger vessels will show what their range really is. It will be remembered that the Marconi Co. fits both the magnetic detector and the Fleming valve on most of its ship sets. We referred to this practice in *ELECTRICAL ENGINEERING* for June 27th, 1912, p. 364, Vol. VIII.

Although most of the large provincial towns have telephone advisory committees, London has not until recently had one. The London Chamber of Commerce has, however, now appointed a special committee to study the working of telephones in London, and take up the question of subscribers' grievances. On the committee are representatives of the City Corporation, L.C.C., Port of London Authority, and other bodies.

The Zanzibar-Mombasa cable was down for a short while on March 21st, and the Persian line between Borazjoon and Ahvaz was restored on the 18th inst.—The Post Office gave notice last Thursday of serious delay in telegrams to and from France owing to cable interruptions.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 183. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**HALF-WATT LAMPS AND FITTINGS.**—Drake & Gorham, Ltd. (1 Felix Street, Westminster Bridge Road, S.E.), has just issued a list dealing with half-watt lamps, lanterns, and fittings. The company stocks, Osram, Mazda, Wotan, Ediswan, and Nitra lamps for 50 to 260 volts and 300 to 1,500 watts. There is also listed a full range of watertight lanterns in different styles and designs. Holophane glassware, and indirect and semi-indirect lighting fittings, are also shown in profusion.

**TRANSFORMERS.**—Another pamphlet from the same company deals with air-cooled 2,200-volt transformers, with oil-filled transformers up to 650 volts, and with air-cooled house transformers up to 250 volts.

**GRINDING AND DRILLING MACHINES.**—A further list deals with electric grinding and drilling machines which are made for D.C. (compound-wound motors) or three-phase A.C. The smaller machines are made either on grinders or drills, or the two may be combined. The machines are neat and form most handy tools. Holes can be drilled up to  $\frac{1}{4}$  in. or 2 in. in diameter, according to the size of machine. The little grinders are light in weight, and can be obtained for bench or lathe work.

**ILLUMINATING MATERIAL.**—A recently issued sectional list sent us by the Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.), prices "Striplite" for outdoor illuminations, such as piers, promenades, bandstands, &c., as well as for indoor and temporary outdoor illuminations. It is also useful for the illumination of lawns. Decorative flexible chains for indoor illuminations of different kinds, using Edison screw lamps or candle lamps, are also dealt with.

**EDISWAN ABRIDGED CATALOGUE.**—An abridged catalogue of "Royal Ediswan" lamps, accessories, cables, wires, conduits, brackets, ship and Majolica fittings, shades, instruments, fans, radiators, indicators, bells, pushes, telephones, signs, and carbons has just been issued by Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex). Many specialities, falling under the above heads, which have been in use by the trade for many years, are included, as are the most recent productions of the firm. Among the lamp section attention may be directed to the "Royal Ediswan" drawn-wire traction lamps. These have short and rigid filaments, and are made in 100- and 130-volt sizes for 20 and 30 watts. They are 4 in. in length and  $2\frac{1}{4}$  in. in diameter. The new "Downlite" lamp for all pressures from 35 to 260 volts, and for 30 to 60 watts, is also listed. Admiralty pattern watertight sockets and plugs, and watertight switches, are included. We may also refer to the well-known "Phlatta" type switches, to the Home Office pattern hand-lamps, and to the new Ediswan glassware known as "Ultralux."

### CHURCH LIGHTING

THE suitable lighting of churches is a subject with special features of its own, and to secure a restful but efficient and worthy illumination requires careful thought in the

FIG. 1.—ELECTRIC LIGHTING AT ST. ANDREW'S, PLAISTOW

arrangement of the lights. The British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street, E.C.) have given the matter a good deal of attention, and have obtained some fine

FIG. 2.—FORMER GAS LIGHTING AT THE SAME CHURCH.

results by the use of Mazda lamps and their special reflectors. A good example of this is the installation recently designed by them and carried out at St. Andrew's, Plaistow, which was formerly lighted by gas. The new installation in

# A LETTER of INTEREST

Please address all communications to "Electricity Works, Maidstone."

	<p><b>Borough of Maidstone</b> <b>Electricity Supply.</b></p> <p>S. E. HOADLEY, M.I.E.E. Engineer and Manager</p>	<p>Telephone: Exchange: Wells. 41 Engineer: Hoadley U6</p>

January 23rd., 1914.

Messrs Drake & Gorham Ltd.,  
1 Felix Street,  
Westminster Bridge Road,  
L O N D O N. S.E.

Gentlemen,

I send you herewith particulars as to our Osram lamps for the year ending December 31st.. 1913.

Description of lamp used..... 230 volt 55 watt.  
Declared pressure..... 230 volts.  
Number of lamps failed during year 761.  
Total hours life .....1,953,219.  
Average life per lamp.....2,566. hours.

Yours faithfully,  
*E. E. Hoadley*

**We can give AN IMMEDIATE  
DELIVERY of OSRAM LAMPS**  
*All Types kept in Stock.*

## DRAKE & GORHAM, Ltd

Telegrams:  
"DRACORLITE," LAMB, LONDON.  
"ACCUMULATOR,"  
MANCHESTER or GLASGOW.  
"SWIFTSURE," LIVERPOOL.

LONDON : 1, Felix Street.

2198 Argyle, Glasgow.  
754 Royal, Liverpool.

the body of the church consists of Corona fittings equipped with Mazda lamps and Opalux glass reflectors. The altar is lighted by means of Mazda lamps in B.T.-H. Mirolux silvered-glass trough reflectors, arranged to project the whole of their light on to the beautiful reredos, while the light units themselves are invisible. Apart from the increased effectiveness of the new installation in enabling the beauty of the altar and of the whole interior of the church to be seen to better advantage, the illumination is more comfortable and agreeable to the congregation than the old gas lighting. By using efficient Opalux reflectors it has been possible to raise the light units above the line of vision without any sacrifice of illumination at eye-level. And, moreover, the Opalux reflectors screen the brilliant lamps and diffuse the light, distributing it with a soft and restful radiance.

The fine effect produced is seen in Fig. 1, and the comparison with Fig. 2, which shows the old gas lighting, is very striking.

### SEARCHLIGHTS

THE accompanying illustration depicts one of many patterns of searchlight projector made by the London Electric Firm (George Street, Croydon).

In addition to the ordinary naval, mercantile, canal, and cinema types, this firm is equipped for making searchlights for any and every purpose, including motor-operated revolving patterns for advertisement purposes, and some fitted in specially made "lighthouses." Locomotive headlight equipments are also supplied. All kinds of mirrors can be furnished

PILOT HOUSE PATTERN OF SEARCHLIGHT.

with this apparatus, including best quality parabolic and patent split mirrors, which are becoming very popular now by reason of their simplicity and high efficiency; also "Mangin" mirrors, and all kinds of the metal variety. The lamps are of various patterns, including combined automatic and hand feed, evolved from long experience. The lenses include dispersing and dark interval types, for double, flat, or oval beams, and for "all-round" dispersion. The Suez and Panama types are made to conform with the Canal Authorities' requirements. In addition to the ordinary enamel finish, the projectors are also made with brass and nickel-plated bodies, suitable for yachts and pleasure steamers. The firm also supply special generating plant for searchlight work.

### HOLOPHANE HALF-WATT LAMP FITTINGS

THE GENERAL ELECTRIC Co., Ltd. (87 Queen Victoria Street, E.C.), has now issued a supplement to its recent price-list of fittings for half-watt lamps. This additional leaflet illustrates four new fittings entitled "Marquis," "Earl," "Noble," and "Peer," which are designed to harmonise with

HALF-WATT HOLOPHANE FITTING.

Holophane glassware. Each is listed in two sizes, so that the diameter of the glass is either 14 in. or 16 in., and the half-watt Osram lamps recommended are 300-500 watts and 500-1,000 watts respectively. The Company will be pleased to forward both list and supplement to all interested, on application to its head office or one of its provincial branches.

"Osram" and "Robertson" Staff Dinner.—The annual dinner of the "Osram" and "Robertson" Electric Lamp Works held at the Clarendon Restaurant, Hammersmith, on Monday evening, under the chairmanship of Mr. C. Wilson (Manager, Osram Lamp Works), was, if possible, even more enjoyable than similar gatherings of previous years. There were present about 140 members of the staffs of the "Osram" and "Robertson" Works, and visitors, the latter including the Mayor of Hammersmith, several Councillors, practically all the Electricity Committee, and Mr. G. G. Bell, Borough Electrical Engineer. After the toast of "The King and Royal Family" had been honoured, the chairman proposed "The Allied Firms." In the course of his remarks on the treatment received from the directors, he mentioned that during the past year their sick fund had collapsed, owing, he believed, to malingering under the Insurance Act, and the directors had decided to set aside a sum for the benefit of those of the "Osram" and "Robertson" staffs who were in need of assistance. He referred also to the great growth of the works during the last few years. Mr. Hugo Hirst made a pleasing reply to the toast, and Mr. F. P. Driver proposed "Our Visitors and the Press." This was responded to by the Mayor of Hammersmith, Mr. Jas. Fletcher, and Mr. S. Rentell. The final toast of "The Chairman" was proposed in a few suitable words by Mr. P. Pring, and briefly replied to. A varied programme of mirth and song, largely carried out by members of the staff of the Lamp Works, proved most enjoyable, and was much appreciated by the audience. From start to finish the dinner appeared to be a great success for all concerned.

## ELECTRIC COOKING APPARATUS

THE illustration given here represents one-seventh part of an order for Calor electric cooking apparatus, which is being executed by Townshend's Art Metal Co., Ltd., Birmingham.

ELECTRIC COOKERS, &amp;C., FOR SOUTH AMERICA.

ham, for South America. As will be seen, there are four ovens of various sizes, two grillers, and a large number of hot-plates, kettles, and other individually heated appliances.

**Sun Worshippers.**—We are informed that the Publicity Department of the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), had a busy day on Monday

THE VOTE WORSHIPPERS.

of last week, which was quite unconsciously caused by the *Daily Express* forming its cartoon on the same design as the Company's famous poster "Sun Worship." It is hoped that political feeling will not in any way be offended by the reproduction of this cartoon.

**Annual Dinner.**—The directors of Electrical Installations, Ltd., entertained some 100 members of the staff and guests at their seventh annual dinner, held last Saturday at the Hotel de l'Europe, Leicester Square. The dinner was followed by a musical entertainment. Mr. H. F. Simon, in the chair, spoke on the labour unrest in the electrical contracting industry, and speeches were made by several other gentlemen.

**MARRYAT & PLACE**  
DYNAMO & MOTOR HOSPITAL,  
**ARMATURE REPAIRS**  
28, HATTON GATE, LONDON, E.C.

## The Perfect Hose Covering

must be strong, flexible, elastic, rust-resisting, durable and of the pattern best adapted to the special requirements of any particular job.

## "PRANA" PLAITED METALLIC

## (non-rusting) HOSE COVERING

fulfils all these requirements and is also of excellent appearance and

## VERY MODERATE IN PRICE.

- 1. Made in a great variety of patterns in steel and brass wire, flat lattice pattern, &c., &c.
- 2. Specially designed for covering Flex.
- 3. Insulates against heat—protects from fire. Indispensable for Chandeliers, Irons, &c., &c.

1. Send for descriptive illustrated Price List.

## AERATORS LIMITED

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Egypt.**—Tenders are invited by April 8th for a 45-kw. crude oil generating set, switchboard, auxiliaries, electric pumps, motors, gearing, cable, &c., for Khanka Sewage Farm. Controller-General Main Drainage Department, Cairo. Deposit, £3 1s. 7d., not returnable.

**Hornsey.**—Application is to be made to the Local Government Board for a loan of £13,744 for a new sub-station at Muswell Hill.

**Kettering.**—The Local Government Board has sanctioned a loan of £12,000 for electricity works extensions.

**London: Hackney.**—Further extensions of the generating station, including a 5,000-kw. turbo-alternator with condensing plant, switchgear, &c., at a cost of £15,750, have been decided upon.

**Marylebone.**—Tenders are to be invited for a new canal condensing-pump motor and equipment.

**Woolwich.**—The following loans have been sanctioned by the London County Council:—£934 and £1,200 for mains; £907 for transformers and switchgear; £880 for house services; £740 for meters; and £4,460 for electrical apparatus to be supplied on the hire system.

**Lurgan.**—An inquiry into an application for a loan for the establishment of a municipal electric lighting scheme is to be heard on Monday next.

**North Skelton.**—A Local Government Board inquiry is to be held on Friday into an application for a loan for an electric lighting scheme.

**Rochdale.**—The Local Government Board has sanctioned a loan of £65,000 for extensions to the electricity works.

**South Shields.**—The Local Government Board has sanctioned loans of £7,039 for generating plant, £2,913 for converting plant, and £4,571 for water-tube boilers and economisers.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aberdeen.**—Children's hospital, Ashley.

**Ashton-under-Lyne.**—Elementary school, Mossley Road.

**Baffling.**—Public hall.

**Bradford.**—Tenders are invited for an electrical installation at the School for the Blind, Odsal House. Director of Education, Town Hall. March 28th.

**Birmingham.**—New theatre on site of Curzon House, Suffolk Street.

**Brierfield.**—New picture palace. Smith Bros., Quaker Bridge, Brierfield.

**Douglas (Isle of Man).**—Secondary school.

**Gloucester.**—New theatre in Westgate Street.

**Gourock.**—New police station, &c., Shore Street.

**London.**—Extensions to Tooting Bec Asylum. Metropolitan Asylums Board.

**Salford.**—Territorial headquarters. Surveyor East Lancs. Association T.F. Town Hall Chambers, Ashton-under-Lyne.

**Skegness.**—New picture theatre and vaudeville house.

**Swindon.**—Elementary school for Ferndale Road district.

**Watford.**—Enlargement of infirmary.

**Willesden.**—Secondary school.

### Miscellaneous

**Manchester.**—Tenders for a twelve months' supply of signal, telegraph, and electric light fittings, and wires, are required by the Lancashire & Yorkshire Railway, March 30th. Mr. Waring, Stores Department, Osborne Street.

## TENDERS RECEIVED AND ACCEPTED

**London: Hackney.**—Time-limit devices to add to the circuit-breakers at the station are to be purchased from G. Ellison.

**Islington.**—Venner & Co. have obtained a contract for the supply of Chamberlain & Hookham A.C. meters.

**L.C.C.**—The tender of Arthur Newman, Ltd., for wiring the Belsize fire-station (£155 10s.), has been accepted.

**L.C.C. Tramways.**—In addition to having carried out the rewinding of seventeen 300-kw. motor-generators, Messrs. Newton Bros., of Derby, are to add further field coils to these machines, at a cost of £685, which will enable their output to be increased to 400 kw.

**Marylebone.**—The tender of the British Westinghouse Co. for a rotary-converter, &c. (£3,202), is recommended for acceptance, subject to the consent of the Local Government Board to the loan.

**Southampton.**—Siemens Bros. Dynamo Works, Ltd., have obtained a contract for the annual supply of electrical stores.

**Southend.**—The tender of Belliss & Morcom for five Diesel engines for new substations at Leigh and Thorpe Bay (£14,510) is recommended for acceptance, subject to the consent of the Local Government Board to the loan.

**Swansea.**—The tender of Callender's for cables (£12,007) has been accepted.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £66 15s. to £67 5s. (Last week, £65 10s. to £66.)

**Bankruptcies, Liquidations, &c.**—Tom Murray Woodcock, Electrical Engineer, 64 Holly Street, Sheffield, has been adjudicated bankrupt.

At the meeting of creditors in the liquidation of the Stolz Electrophone Co. (1913), Ltd., the Official Receiver said that there had been a good deal of irregularity in the company's affairs, and he had been unable to find the whereabouts of Mr. Holt, the promoter and managing director. The Official Receiver (Mr. H. E. Burgess) was appointed liquidator with a committee of inspection of three creditors and one shareholder.

**Canadian Agency.**—Two English engineers in Toronto, says the *Board of Trade Journal*, wish to represent United Kingdom manufacturers of electrical supplies. Imperial Trade Correspondent, P.O. Box 176, Toronto.

**Change of Telephone Number.**—Electrical Installations, Ltd. (27 Martin's Lane, Cannon Street), advise us that their telephone number is now City 3897 (3 lines).

**Companies Struck off Register.**—The following have been struck off the register of joint stock companies:—British Electrics (Moseley's Patents), Ltd.; Ecco Battery & Electrical Co., Ltd.; Electromuse, Ltd.; Hunslet Electrical Pottery Co., Ltd.; Madeira Electric Lighting Co., Ltd.; Mutual Electricity Supply Co., Ltd.; Premier Electric Lamp Co., Ltd.; "Simplex" Arc Lamp Syndicate, Ltd.; Westminster Automatic Telephone Syndicate, Ltd.

## APPOINTMENTS AND PERSONAL NOTES

Mr. H. Richardson (City Electrical Engineer, Dundee) has been recommended, out of a list of sixty-nine candidates, for the post of Electrical Engineer to the Salford Corporation, at a salary of £1,000 per annum. At a meeting, however, of the Dundee Council it was decided to offer him an increase from his present salary of £650 to £800 per annum, with further annual increases of £50 up to £1,000, if he would stay at Dundee.

Mr. J. A. Tomlinson has been appointed Chief Assistant in the electro-technical department of the Borough Polytechnic, in place of Mr. H. S. Saunders, who has been appointed Responsible Master to a London County Council Junior Technical Institute, and Mr. G. W. Hird as Assistant in the engineering department, in place of Mr. A. E. Gladwyn, who has gone to the West Ham Technical Institute.

FOR  
**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

Mr. Archibald Page, Chief Assistant Electrical Engineer, Glasgow, who was also on the short list at Salford, is having his salary increased from £650 to £800 by annual increments of £25.

The salary of Mr. T. J. Kendrew, Tramways Manager, Southport, is to be increased from £200 to £250 per annum.

The salary of Mr. J. A. Cookson, Mains Surveyor, Manchester, is to be raised from £400 to £450 per annum.

Mr. C. E. Davies, of Erith, has been appointed Mains Superintendent at Hammersmith at a salary of £150, rising to £175, per annum. There were thirty-five applicants.

British Insulated & Helsby Cables, Ltd., require draughtsmen for cable accessories. (See an advertisement on another page.)

## LOCAL NOTES

**Banstead: Electricity Supply.**—A Board of Trade inquiry has been held regarding the application of Mr. Gilbert Allom for a provisional order for supply in the Banstead, Walton-on-the-Hill, and Kingswood districts. The inspector intimated that the order would proceed.

**Barry (Scotland): Electric Supply.**—An electric supply scheme at a cost of £650 has been decided upon.

**Colwyn Bay: Electric Supply.**—Two schemes—one by the Borough Electrical Engineer, Mr. Tudman, involving a new station at the Bron-y-Nant destructor works, and the other for a bulk supply by the North Wales Power & Traction Co.—are to be submitted to an expert for report.

**Connahs Quay (North Wales): Electric Supply.**—A proposal for an electric lighting scheme has been adopted.

**Crowle: Proposed Electricity Supply.**—A proposal for an electric lighting scheme has been considered by the Council, but has been negated.

**Edinburgh: Supply to Suburban Districts.**—A Board of Trade inquiry is in progress regarding the application of the Corporation to include Cramond, Corstorphine, Liberton, and Newton into their area of supply. The Colinton Tramways Co. also ask for power to supply within the parishes of Colinton and Corstorphine for the Corporation.

**Heckmondwike: New Tariff.**—A revised scale of charges with current for lighting at 5d. per unit and power at 1½d., which is a 50 per cent. increase, and a sliding scale, has been decided upon.

**London: Hampstead: Profit-Sharing Scheme.**—The Council has adopted a recommendation of the Committee to reorganise the staff of the Electric Supply Department so that the officials and permanent workmen, who number 139, participate in the profits of the undertaking.

**Kensington: Street Lighting.**—1,000-c.p. half-watt lamps are to be tried experimentally in High Street, Kensington, and if successful the whole of the electric lamps in the Borough will be replaced by them.

**Marylebone: Loans.**—In view of the Borough Council having decided not to take up the loan of £10,825 which had been sanctioned by the L.C.C., the Finance Committee recommends that the resolution granting the loan be rescinded.

**Electric Cooking.**—The charge of 15s. per quarter for the hire of cookers is to be reduced to 3s. 6d., and the charge for current increased from ½d. to ¾d. per unit.

**Manchester: Street Lighting.**—Half-watt lamps are to be installed at the junction of Market Street and Cross Street, and will be suspended from the tramway poles in Oxford Road from Whitworth Street to Cavendish Street, but centrally-suspended lamps are to be provided from Deansgate to Whitworth Street.

**Newport (Mon.): The "Northumberland" Clause.**—The Newport Corporation Bill which proposed to add to the electricity area of the Corporation a number of manufacturing districts outside the borough, has been considered by a House of Lords Committee this week. The case in favour of the extension was that there are a large number of works in the proposed additional area for which a supply of electric power was essential. The only opposition to the scheme was by the Newport Gas Co., which sought either to have it rejected or that the Northumberland Clause, which provides that the rates charged must be so adjusted from year to year that the undertaking must be carried on at a profit, should be inserted. The Committee, however, refused to grant the extended area, and the Gas Company thereupon asked that the Northumberland Clause should be applied to the Borough of Newport in relation to the existing electricity undertaking. After evidence on

both sides, however, the Committee refused to insert the clause.

**Northwich: Electricity Supply.**—The area of supply of the Weaverham Northwich Electrical Supply Co. is being extended to include Sandiway and Buddington. An overhead system is being adopted.

**Nottingham: Electricity Supply.**—According to the commercial year-book of the Nottingham Chamber of Commerce, which contains a quantity of interesting information as to local industries, the total output of the Electricity Works is over 12 million units per annum, of which nearly 3 million represents power and over 5 million tramways, and the average price per unit is 1.79d.

**Reigate: New Tariffs.**—The rate for power is to be reduced from 2d. to 1½d. per unit, and a new rate of 1d. per unit is to be adopted for heating and cooking. Meter rents are also to be abolished, except where the account is less than 10s. per quarter.

**Southampton: Electric Heating.**—An increased price charged for hire of radiators has resulted in many being returned, but it has now been decided to allow those in possession of older types of radiator to retain them at the old charge.

**Swansea: Allocation of Profits.**—After considerable discussion, the Lighting Committee has decided to recommend against allocating any part of the profits of the Electricity Department to the rates.

**Tonbridge: New Plant.**—The new Diesel set was inaugurated last week. The plant was installed by Mirrieles, Bickerton & Day, for £2,100, and is expected to result in considerable saving in costs.

**Wye: Electric Supply.**—At a public meeting last week a resolution in favour of an electric lighting scheme was carried.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**British L.M. Ericsson Mnf. Co.**—The profits for the year have exceeded those of 1912 by £5,218, notwithstanding that prices had to be cut fine to secure post-office work. An 8 per cent. dividend is recommended.

**Cleveland & Durham Electric Power Co.**—A profit of £25,700 has been made on the year's working. A dividend of 5 per cent. on the preference shares is recommended.

**W. T. Glover & Co.**—A trading profit of £33,795 is reported, and dividends of 5 per cent. on the preference and ordinary shares, with a bonus of 2½ per cent. with the latter, are declared.

**Melbourne Electric Supply Corporation.**—£150,000 5 per cent. debentures are to be issued.

**Richardsons, Westgarth & Co.**—A profit of £25,377 has been made, leaving £7,927 after payment of debenture interest and directors' fees.

**Urban Electric Supply Co.**—Out of an available balance of £23,021, a sum of £12,000 is to be placed to reserve, and a dividend of 4 per cent. is to be paid on the preference shares.

**Crompton & Co.**—The proposed scheme of rearrangement was passed at a meeting of debenture-holders on Monday. The debenture interest will be raised from 5 per cent. to 5½ per cent.

## NEW COMPANIES

**BISHOP'S CASTLE ELECTRIC LIGHT & POWER CO.**, 79 Lichfield Street, Wolverhampton. Capital £2,500.

**ELECTRO BLEACH AND BY-PRODUCTS**, Middlewich, Cheshire. Capital, £180,000. Manufacturers of and dealers in electrolytic products. First directors, H. J. MacKinder, J. Swinburne, F. J. Dundas, E. G. Cubitt, and T. W. Stainer-Hutchins.

**Accident at the Westinghouse Works.**—A coroner's inquiry into a fatal accident, due to electric shock, on March 15th, was held on March 17th. It appears that a Mr. J. H. Hepworth was working on a dead conductor, in connection with a test which was in progress, and for some reason made a measurement on a live conductor some distance away, though he knew that the power was constantly being switched on and off. A verdict of accidental death was returned.

**"The Dignity of Business."**—This is the title of a book just published by Ewart, Seymour & Co., Ltd., and written by Mr. H. E. Morgan. It consists of a series of articles principally addressed to parents and those guiding young men in the choice of a career, and training them for the work of life.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

THE wiremen belonging to the Electrical Trades Union were ordered out on strike this morning. Either the membership of this union is considerably less than has been stated, or very many of the members have simply disobeyed the order, for the number of men on strike is extremely small, and, with but one or two exceptions, the wiring work in progress is being continued without interruption. (Page 187.)

THE Council of the Institution of Electrical Engineers has issued its list of nominations for next session's officers and council. Mr. J. F. C. Snell is nominated for the Presidency. (Page 187.)

THE festival dinner of the Electrical Trades Benevolent Institution was held on Wednesday of last week at the Trocadero Restaurant. Mr. Hugo Hirst was in the chair, and it was announced that a sum of over £2,700 had been contributed in connection with the dinner. (Page 188.)

THE preliminary programme of the Convention of the Incorporated Municipal Electrical Association to be held in Birmingham in June under the Presidency of Mr. R. A. Chattock, has been issued. Meetings will be held in Coventry and Stratford-on-Avon, as well as Birmingham. (Page 188.)

THE question of the use of reactances in A.C. distributing systems of 100,000 kw. and above was considered by the Institution of Electrical Engineers at the last meeting, when a Paper on the subject was read by Mr. K. M. Faye-Hansen and Mr. J. S. Peck. Of the three possible places for the insertion of the coils—bus-bars, generator circuit, or feeders—the

meeting, on the whole, favoured the first, with, in some cases, generator reactance as well, as the necessary reactance for the feeder circuits could be incorporated in the transformers at the ends of the feeders. (Page 189.)

THE adaptation of a three-phase motor to run on other voltage from that for which it was designed is discussed in our Questions and Answers columns. (Page 190.)

IN the course of a Paper dealing with commercial motor vehicles, Mr. T. Clarkson referred to the lighting of omnibuses, and described the steam-driven dynamo used on the "National" omnibuses.—Mr. T. G. Gribble has also considered the question of the comparative economics of tramways and railless electric traction. He finds that with a 2½ min. service the cost of working is in favour of the latter by 7 per cent., and the cost of construction by 44 per cent., and that the saving increases inversely as the traffic density.—The new interchange underground railway station at Charing Cross is to be opened on Monday. (Page 190.)

THE principles of long-distance telephony were illustrated by interesting experiments during Prof. J. A. Fleming's discourse at the Royal Institution last Friday. (Page 191.)

THE grant of a patent to H. Leiser for the production of tungsten suitable for drawing into lamp filaments has been allowed, in spite of opposition. The grant of a patent to J. Close for a mine signalling system has been refused by the Comptroller. Last week the Patent Office published specifications relating to variable-speed dynamos, by the B.T.-H. Co.; regenerative motor control, by Crompton & Co.; oil-immersed switchgear, by the A.E.G.; the electrical treatment of plants, &c., by R. M. Mies; and other branches of electrical engineering. (Page 192.)

THE question of the automatic control of mining machinery was dealt with by Mr. G. W. Humphry in a Paper read before the Association of Mining Electrical Engineers. (Page 193.)

AN electric winder recently installed at a French iron mine exemplifies several points of interest in the design of such apparatus. (Page 193.)

SOME features of a modern electric colliery winding plant are given by Mr. J. Gillespie, and the general problem of electric v. steam drive for intermittent loads is considered by Mr. E. I. David. (Page 194.)

THE patent specifications published by the Patent Office during March of interest to mining electrical engineers and electro-metallurgists include some dealing with mine signalling, the manufacture of cement steel, the electro-deposition of copper from solutions containing iron salts, welding, &c. (Page 195.)

AN illustrated article describes an electric power equipment at a large bakery in Scotland. (Page 196.)

A FOOL-PROOF starter and some new indirect lighting

fittings are described in our Trade Section. (Pages 197 and 198.)

New plant, cables, transformers, switchgear, &c., are required at Rawtenstall, Devonport, Plymouth, Wigan, Peterborough, Wallasey, Walsall, and Dudley. —A large scheme of extensions estimated to cost £200,000 is under consideration at Leeds. (Page 199.)

THE Shropshire Power Co. is proposing to issue additional preference capital in connection with its purchase of the Dudley electricity undertaking. —A number of proposals for working the Hove electricity undertaking are being reported upon by the Corporation's consulting engineer. (Page 200.)

THE British Westinghouse Co. reports a record year for 1913, and a net profit of £106,493. —The South London Electric Supply Corporation and the County of London Electric Supply Co. are issuing new capital. (Page 200.)

MR. J. A. ROBERTSON, Borough Electrical Engineer at Greenock, has been appointed Electrical Engineer to the Salford Corporation. (Page 200.)

**Metal-Filament Lamp Patents.**—Last Thursday the Comptroller heard the opposition by Brimsdown Lamp Works, Ltd., to the Grant of Patent No. 12,753/13 to Wolfram Lampen A.G. Judgment was reserved. As given in ELECTRICAL ENGINEERING for December 4th, 1913, p. 683, Vol. IX., the opposers cited sixteen patents as being anticipatory, but they relied chiefly on Nos. 5,206/12 granted to J. Hubers, to whom the invention was committed by Julius Pintsch A.G., 20,227/07 granted to the B.T.-H. Co. as a communication from the G. E. Co. of America, and 27,710/10 granted to Lichtwerke G.m.b.H. They also said that the invention was not fairly described. It was admitted that the invention consisted in the application of a known material to a new purpose—filament supports of 98 per cent. tungsten and 2 per cent. of thorium oxide. The Brimsdown Co. argued that it was well known to use filament supports of the same material as the filaments, and the use of thorium with tungsten was known. The argument was on narrow issues, and included whether the resulting support was a mixture or an alloy.

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 2ND.

*Institution of Electrical Engineers.*

"The Signalling of a Rapid Transit Railway," by H. G. Brown.

FRIDAY, APRIL 3RD.

*Royal Institution.*

9 p.m. Evening discourse on "Further Researches on Positive Rays," by Prof. Sir J. J. Thomson, F.R.S.

MONDAY, APRIL 6TH.

*Society of Engineers.*

7.30 p.m. At Institution of Electrical Engineers. "The Utilisation of Solar Energy," by A. S. E. Ackermann.

TUESDAY, APRIL 7TH.

*Institution of Electrical Engineers: Manchester Local Section.*

7.30 p.m. At University. "Current Limiting Reactances on Large Power Systems," by K. M. Faye-Hansen and J. S. Peck.

*Illuminating Engineering Society.*

8 p.m. At Royal Society of Arts. Discussion on "The Lighting of Railway Carriages and other Public Vehicles," to be opened by E. K. Scott.

WEDNESDAY, APRIL 8TH.

*Institution of Electrical Engineers: Birmingham Section.*

7.30 p.m. At the University. "Reactances in Alternating Current Circuits," by J. S. Peck.

SATURDAY, APRIL 11TH.

*Association of Mining Electrical Engineers.*

6.30 p.m. S. Wales Branch, at Technical College, Swansea. "Automatic Controllers for Mining Work," by G. W. Humphry.

## The London Electrical Engineers.

Headquarters (46 Regency Street, S.W.) open Sats. till noon.

Rating Exam. for all Cos. from 7 to 10 p.m. every Wednesday.

Easter Camp will be at Cliffe Fort, near Gravesend, from April 9th (parade at Headquarters at 11 a.m.) till April 18th. Camp cards must be sent in at once.

(TO-DAY) THURSDAY, APRIL 2ND, C. Co. FRIDAY, APRIL 3RD,

D. Co. MONDAY, APRIL 6TH, A. Co. TUESDAY, APRIL 7TH,

B. Co., Tech. Inst., 7 to 10 p.m. Min. Range, 7 to 9 p.m.

WEDNESDAY, APRIL 8TH.—Recruit Instruction, 7 to 10 p.m.

THE ELECTRICIANS' STRIKE: As the Daily Papers predicted.

As it is.

## WIREMEN'S STRIKE IN LONDON

**A**LTHOUGH the London Branch of the Electric Trades Union instructed its members to strike at nine o'clock yesterday morning, very few men indeed have left work.

Yesterday morning, inquiry of some of the chief firms of wiring contractors and others in London, elicited the following information:—

*H. J. Cash & Co.*—One man on strike out of about 40 engaged in London. No picketing.

*Drake & Gorham.*—Would not have known that a strike had been declared unless they had read it in the daily papers. Possibly one or two of the men may not have turned up on some of the jobs in hand, but no difference is noticeable.

*Edmundsons.*—Little work in London. No strike.

*Electrical Installations, Ltd.*—About 14 on strike, and about 80 at work.

*Rashleigh Phipps.*—About 70 men at work. Six union men were paid off last night. No picketing.

*Rawlings Bros.*—Three union men have struck work, and have been replaced by non-union men. About 30 men are at work in London. No picketing.

*Strode & Co.*—Out of about 65 men, only about a dozen are working. Four of their foremen are members of the Electrical Trade Union, and a large proportion of the workmen.

*Trollope and Colls.*—No men on strike. About 40 to 50 wiremen at work—all non-union. Men thoroughly satisfied.

*Duncan Watson.*—No men on strike; 50 to 60 hands working.

*Whiteley's.*—No men out. About 25 men working in London.

*Harrods.*—Twelve men on strike, and about six working.

*Pinching & Walton.*—No men on strike, but only about 6 men working in London at present.

*Marryat & Place.*—No men out; about 30 wiremen working.

*V. G. Middleton.*—Twelve men on strike.

*Donnison, Sillem & Co.*—All their men on strike; about 20 have ceased work.

*Leonard Tate & Co.*—No men on strike, about 6 employed in London at present.

*Buchanan & Curwen.*—No men on strike, about 12 men working in London at present. No picketing.

*G. E. Taylor & Co.*—No men on strike, about 20 employed.

*Marylebone Borough Council.*—Not affected. Do no regular wiring work themselves. None of the meter fixers are out, and no trouble in construction department or at the generating station.

*Grant & Taylor.*—Fifteen men on strike out of about 20.

*J. Lyons & Co.*—The men at work on the new hotel in Glasshouse Street, Piccadilly, have struck work.

*Maple & Co.*—Seven men have ceased work out of about 60 working in London.

*Higgins & Griffiths.*—About 30 men out on strike, and in consequence very little work doing in London. About 18 of these, however, were already out "in sympathy" with the builders, and the remaining 12 or so have struck to-day.

The sequence of affairs since last Thursday is as follows: Last Thursday, the London Electrical Masters' Association refused to grant any further concessions; they had already granted an increase of minimum wages to competent wiremen (not including mere pipe-fitters) from 9d. or 9½d. an hour to 10d., with a further rise to 10½d. in July. On Friday the Electrical Trades Union discussed the matter for seven hours, and decided that a strike should be called for a minimum wage of 11d., to all workers (they refused to allow any differentiation between pipe-fitters and wiremen), and they further refused to agree to the condition that the Union men should work amicably with non-union men. The men were instructed, however, that they might work for 10½d. if the other conditions were agreed to by the masters, but no firms have done so.

It appears that, before giving the date for the strike, the Union approached the masters again and begged them to reconsider their decision, but they stood firm. The Union then instructed their members to cease work yesterday morning at nine o'clock, but, as seen above, the response has been ridiculously small, and except in the case of one or two firms, the work is unaffected.

Some of the daily newspapers published sensational articles last week, intimating that a general electrical strike was threatened, and that the electric lighting of the metropolis would be affected and the tubes and tramways stopped, but these were quite without foundation, and as seen above, the strike is confined to a few ill-advised wiremen, who will doubtless soon see the futility of their action.

It will be noted from the figures above that the total number of men employed by the larger wiring firms in London is much smaller than usual. There is, in fact, an exceptionally small amount of wiring work in progress; some is held up on account of the builders' strike, and generally the orders for new wiring work have been less than is customary at this time of the year owing to the unrest in the building trade.

We are asked by the Association of Electrical Station Engineers to say that this Association is not in any way connected with the Electrical Trades Union, and that there is no question of the central station employees joining the strike.

## THE INSTITUTION COUNCIL

**T**HE nominations by the Council of the Institution of Electrical Engineers for the new Council for 1914-15 have just been issued, and balloting papers will be sent out on May 1st. In accordance with the Articles of Association, two names in excess of the number of vacancies have been nominated, and it is open to any ten members to nominate any further candidates before the 21st of this month. The following is a list of the nominations:—

J. F. C. SNELL.

Nominated as President of the Institution for 1914-15.

**President:** Mr. J. F. C. Snell, nominated to succeed Mr. W. Duddell, who is retiring from the Council. Mr. Snell is partner in the firm of consulting engineers, Messrs. Preece, Cardew & Snell. He has risen to be nominated President very quickly, having only been elected Vice-President in 1911. He was on the Council first in 1909.

**Vice-Presidents:** Messrs. J. S. Highfield and C. H. Wordingham are nominated in succession to the Hon. Sir C. A. Parsons, who retires from the Council, and Mr.

Snell, who is raised to President. Messrs. W. Judd and C. H. Merz remain in office as Vice-Presidents. Mr. Highfield is Engineer and Manager of the Metropolitan Electric Supply Co., and has been on the Council three times before—in 1904, 1911, and 1913. Mr. C. H. Wordingham is Electrical Engineer to the Admiralty. He was on the Council first in 1896, and has served several times since. Neither Mr. Highfield nor Mr. Wordingham have been Vice-President before.

**Ordinary Members of Council:** There are six vacancies, due to the nomination of Mr. Highfield as Vice-President and the retirement of Messrs. H. Hirst, B. M. Jenkin, J. E. Kingsbury, C. P. Sparks, and H. E. Wimperis.

The following eight members are nominated for the ballot for these vacancies:—Prof. B. Hopkinson, F.R.S., who is Professor of Mechanical Sciences at the University of Cambridge; Mr. G. W. Partridge, Engineer-in-Chief of the London Electric Supply Corporation; Mr. W. H. Patchell, formerly Engineer-in-Chief of the Charing Cross, West End & City Electricity Supply Co., and now in consulting practice; Mr. W. Ll. Preece, a member of the firm of Preece, Cardew & Snell, and a son of the late Sir William Preece; Mr. G. S. Ram, Electrical Inspector of Factories; Mr. W. Slingo, Engineer-in-Chief to the Post Office; Mr. A. A. C. Swinton, Consulting Engineer; and Mr. W. B. Woodhouse, Engineer-in-Chief to the Yorkshire Electric Power Co. Prof. Hopkinson, Mr. Woodhouse, Mr. Slingo, Mr. Ll. Preece, and Mr. Ram have not served on the Council before, but Mr. Ram was a candidate in 1913. Mr. Swinton has been on the Council several times since 1897, and Mr. Patchell was

Vice-President in 1905, 1910, and 1911, and first joined the Council in 1907. Mr. Partridge served on the Council for three years since 1906.

Messrs. R. A. Chattock, F. Gill, W. Rutherford, A. H. Seabrook, Roger T. Smith, and Dr. A. Russell remain in office.

Mr. Robert Hammond is nominated for re-election as Honorary Treasurer.

The three Associate Members and three Associates who are on the Council remain in office. The three Associate Members are Messrs. F. E. Berry, A. W. Martin, and Captain E. O. Henrici, C.B.; and the three Associates are Messrs. A. B. Anderson, E. Russell Clarke, and A. M. J. Ogilvie, C.B.

### FESTIVAL DINNER OF THE ELECTRICAL TRADES BENEVOLENT INSTITUTION

IN every way the Annual Festival Dinner of the Electrical Trades Benevolent Institution, held on Wednesday, March 25th, at the Trocadero Restaurant, constituted a record, and its unqualified success is in large measure due to the personal work of the Chairman, Mr. Hugo Hirst, which is evident from the large proportion of the contributions in connection with the dinner which are included under the "Chairman's list." It was announced that the total sum already contributed to the dinner fund was £2,762, including this list. One hundred and eighty-three dinner tickets were sold, and we understand the actual collection in the room amounted to £162, including a gift of twenty guineas from Mr. Godfrey Isaacs. Letters regretting inability to attend were received from about forty gentlemen and from representatives of the following Societies:—Institution of Electrical Engineers, Association of Mining Electrical Engineers, British Electrical and Allied Manufacturers' Association, Consulting Engineers Association, Electric Vehicle Committee, London Electrical Engineers, Incorporated Association of Electrical Power Companies, Incorporated Municipal Electrical Association, Municipal Tramways Association, Tramways and Light Railways Association, Electrical Surveyors' Society.

The toast of the evening, that of the Electrical Trades Benevolent Institution, was proposed by Mr. Hirst in a happy speech. In the younger days of the industry, he said, there had been, perhaps naturally, neglect to make provision for those who fell by the wayside, but now, as the industry was older, such provision was a necessity. It was particularly so in the electrical industry, which included many whose position made them hesitate to show their troubles in the light of day. Their fund was to provide for such, as well as the classes who had the right to call for help. He wished to thank all those who had come forward so handsomely, and particularly Mr. E. Garcke, for his help in connection with Mr. Byng's offer last year, and he thanked his own colleagues and staff, by whose help contributions had been obtained even from many outside the actual industry. He also gave the Press his heartfelt thanks for their valuable help. He had received many curious letters in connection with his appeal to electrical firms. Some had criticised the high ratio of expenses to relief given, but this was necessarily so at the start. Others suggested that when the electrical trade was prosperous was not a suitable time to beg. He himself thought it was the very best time. Again, some firms declined to contribute, as they had sick funds, &c., of their own, but in this connection he reminded them that men in the electrical industry rarely remained with one firm throughout their whole career. Some sheltered behind the aesthetic criticism that it was undignified to beg. He would himself like to see on their Council more official representation of such bodies as the B.E.A.M.A., the I.M.E.A., the E.C.A., &c., which he thought would result in an automatic income from the membership of these bodies; but in the meantime he could do no more than quote the well-known words: "Pass the hat, and pay, pay, pay."

The toast was supported by Sir David Salomons (President of the Institution), who spoke gratefully of the work of his predecessor, Sir William Preece, and in looking back to the days when telegraphy was the only electrical engineering we knew, and again to the time of the discovery of the principle of the dynamo by Faraday, he showed how the growth of a mighty industry had necessitated such a fund.

Mr. C. H. Wordingham (Vice-President) also spoke, and related how he was at one time against the establishment of

the fund as well as that of the Institution of Electrical Engineers as the multiplication of organisations did not tend to economy. Now, however, as he had come to realise that the latter fund only related to members of their own Institution, and that the Electrical Trades Benevolent Fund benefited a vastly larger class, he was an enthusiastic convert. It had been urged that since the passing of the Insurance Act there was no necessity for these funds, but there were many who were benefited by them who did not come under the Act at all. That they were at present only able to pay comparatively small sums in relief was due to the fact that such payments had to be made from income, and not from capital. In conclusion, he suggested that perhaps kinship might be claimed with some of the rich City Companies, such as the Fanmakers, the Wire drawers, the Waxchangers, and indeed the Girdlers, for had not electricity put a girdle round the earth?

The toast was further supported by Mr. Godfrey C. Isaacs (Managing Director, Marconi's Wireless Telegraph Co.), in the absence of Mr. F. Faithfull Begg, Vice-President. He appealed, not on the ground of charity, but put it that it was a duty of every large industry to provide relief for those who needed it. We were, he said, a nation particularly devoid of thrift, and such a scheme was of exceptional value as a lesson in thrift. His own company had such a fund, to which at present £5,000 a year was contributed, half by the firm and half by the employees, but he hoped that when sufficient capital was accumulated this, as should be also that of the Electrical Trades Benevolent Institution, would become self-supporting.

The health of the Chairman was proposed by Mr. Justus Eck (Chairman of the Committee), who expressed his appreciation of Mr. Hirst's valuable work for the Institution, not only in presiding there and in collecting contributions, but in interesting his colleagues in the movement. He referred to the late Mr. Gustave Byng's bequest and his son's generous offer last year. Mr. Hirst then replied briefly, and remarked that he hoped that the total of £2,762 which had been mentioned was not quite complete.

During the evening an excellent programme of music was performed, to which Mr. T. E. Gatehouse contributed some violin solos.

### THE CONVENTION OF THE MUNICIPAL ELECTRICAL ASSOCIATION

THE preliminary programme of the Nineteenth Annual Convention of the Incorporated Municipal Electrical Association, to be held in Birmingham on June 15th to 20th next, has now been issued. At the opening meeting (at the Midland Institute), on Tuesday, June 16th, the members will be welcomed by the Lord Mayor, Mr. R. A. Chattock will give his presidential address, and a Paper on "The Commercial Development of Electrical Supply in Towns of Moderate Size," by Mr. W. A. Vignoles, will be read. For the afternoon, visits have been arranged to the works of the General Electric Co. and Belliss & Morcom. The Birmingham Corporation Electricity Works, Summer Lane, and the works of the following firms will also be open for inspection: Chamberlain & Hookham; Electric & Ordnance Accessories Co.; Veritys, Ltd.; Simplex Conduits, Ltd.; Berry, Skinner & Co.; Tubes, Ltd. Ladies accompanying the party will have the opportunity of visiting the Birmingham Art Gallery and Elkington's showrooms and works, and the Annual Dinner will be held at the Grand Hotel in the evening.

Wednesday's meeting will be held at Coventry, and Mr. S. E. Fedden will read a Paper on "The Design and Operation of Modern Boiler-House Plant." The Mayor will entertain the party to lunch, and visits to the Corporation Electricity Works and the Daimler Co.'s works have been arranged for the afternoon. The Coventry Ordnance, Triumph Motor Cycle, and Coventry Chain Companies' works will be open to inspection. The British Thomson-Houston Co. and Willans & Robinson are also making arrangements to convey members desirous of seeing their works to Rugby and back during the afternoon. Ladies will be able to visit Coombe Abbey in the morning and places of interest in Coventry in the afternoon. The party will then return to Birmingham, where a reception and dance will be given by the Lord Mayor and Lady Mayoress (Lt.-Col. and Mrs. E. Martineau).

On Thursday a morning meeting will be held at Stratford-on-Avon, where Mr. J. Horace Bowden will read a Paper on "Standardisation of Tariffs." The ladies will visit places of interest in the town in the morning, and Warwick will be visited in the afternoon. An open-air fête at the Botanical Gardens, Edgbaston, Birmingham, will be held in the evening.

On Friday the Annual General Meeting will be held in the morning, and the Summer Lane generating station of the Birmingham Corporation will be visited in the afternoon. For those remaining till Saturday a visit to Worcester has been arranged.

## REACTANCES

"CURRENT Limiting Reactances on Large Power Systems" was the title of a Paper by Mr. K. M. Faye-Hansen and Mr. J. S. Pack, read before the Institution of Electrical Engineers last Thursday. Because of the increase in size of modern generating stations and their liability to sudden changes of load, owing to supplying large manufacturing concerns, tramways, and railways, it is important that any trouble occasioned in one section be limited to that section and kept as small as possible. To effect this current limiting reactances may be used. These may be placed in the generator leads, in the feeders, or between sections of the bus-bars. If placed in the generator leads the following advantages are obtained: Bus-bar pressure may be kept constant, so that it is the same for all feeders; no damage is done to the generators in the case of a short-circuit on a feeder or bus-bar; no damage is done to the generator circuit-breakers in any case, and synchronous apparatus will not fall out of step in the case of a short-circuit on the generator. Against these advantages must be set the following disadvantages: Enormous current-rush into a short-circuit on a feeder, excessive load on the feeder circuit-breaker in the case of a fault on a feeder, and synchronous apparatus may fall out of step, and a complete shut-down follow a short-circuit on a feeder or bus-bar. Reactances only in the generator leads are therefore only of use for protecting generator windings and circuit-breakers. If the generator reactance were 6 per cent., and 6 per cent. were added, the maximum current which could flow would be  $8\frac{1}{2}$  times normal, or somewhat more than this, due to the doubling effect. Any generator should be able to stand this. Where transformers are used between the generators and bus-bar, they may themselves be designed with high internal reactance. With regard to placing reactances in the feeders the following advantages will accrue: A short-circuit on a feeder causes no serious disturbance on the system, and there is no excessive overload on circuit-breakers or generators. The feeder circuit-breakers may be of smaller breaking capacity than those where feeder reactances are not used. The tendency of synchronous apparatus to feed back in the case of a bus-bar fault is slightly reduced. On the other hand, the pressure-drop on the feeders will vary with the load, and cannot be compensated for by varying the bus-bar pressure. A short-circuit on the bus-bar or generators is a short-circuit directly on the terminals of all generators. The generator windings and circuit-breakers may be damaged and the complete plant shut down. A short-circuit on any generator or between any generator and its circuit-breaker may throw an excessive load on this circuit-breaker, and if it fails to clear the fault the whole system will be shut down. The size of feeder reactances will depend on the capacity of the feeder compared with that of the generators, and upon the breaking capacity of the feeder circuit-breaker, so that unless the total feeder rating is greatly in excess of that of the generators the total k.v.a. capacity of the reactances will be less. If the rating is in excess, their use may not be justified. If step-up transformers are used, they may be designed with high internal reactance without appreciable increase in cost. If reactances are used in the bus-bars trouble is confined to the particular section on which the fault occurs, the amount of current that can be fed into a fault is reduced, and the danger in the case of bad synchronising is considerably reduced. However, no protection to a generator is given when a short-circuit occurs on or near its bus-bar section, and the generators coupled to the different bus-bar sections must be run with a certain angular displacement in their pressures.

By using reactance in generator circuits and feeders trouble is confined to the particular feeder section affected, the load on the feeder circuit-breaker is reduced, and the fault damage is reduced. By placing reactances in feeders and bus-bars the greatest possible freedom from operating troubles is obtained, and if the generators can safely withstand short-circuit, or if the chance of a short-circuit in the bus-bars is considered negligible, some form of this arrangement probably offers the most complete solution of the problem. If the different sections of the bus-bars feed into the same bus-bars at the sub-stations, however, the impedance of the cables connecting the different sections may be less than that of the reactance coils, so that much of their advantage will be lost. Also there is the possibility that when one section is more heavily loaded than another, the cables on one section will be overloaded, due to the angular displacement in pressure between the sections.

The coils themselves may have their magnetic circuits entirely in air, or an arrangement using a central air core with an external iron path of laminated stampings may be used. The larger the capacity and the lower the frequency the less the advantage of this construction. For feeder reactances where the maximum short-circuit current is perhaps twenty to thirty times the normal that the coils can carry without overheating the air-core construction is best, but for bus-bar reactances, where the maximum current will not as a rule be more than four to ten times the normal, the construction using some iron may prove more economical. This may also be true for generator reactances in some cases.

The Discussion was opened by Mr. W. B. Woodhouse (Manager and Chief Engineer, Yorkshire Electric Power Co.), who remarked that all alternating-current apparatus except switchgear had reactance as well as resistance. The tendency lately had been to build machines with 10, 15, or even 20 per cent. reactance. He hoped it was not beyond the power of designers to build also machines capable of standing up to the momentary current rush on short-circuit. He did not think that external reactance would be necessary. With regard to feeders, if the switchgear could be made to stand the short-circuit current, here also added reactances would not be required, but additional protection could be afforded by switchgear. Sectional bus-bar resistances were, however, desirable. The cost of introduction was not very great, but the regulation of the system was made worse, and synchronous condensers would have to be added. He was able to run two stations having turbo-alternators with 20 per cent. reactance successfully in parallel over a line thirteen miles long without added reactance. Mr. G. W. Partidge (Chief Engineer, London Electric Supply Corporation) thought that his company was the first to use reactance coils in this country, in connection with the supply to the Brighton Railway. These had some iron in the magnetic circuit, and took a maximum current of 20,000 amperes. They weighed fifteen tons. Air core coils were very good if room could be found in the station for them. He sketched a system designed to give great flexibility and protection against bad synchronising, at the same time cutting the size and number of coils down to a minimum, at the expense, however, of increased switching. He showed also some oscillographs taken by Mr. W. Duddell on a 7,500-kw. turbo-alternator to demonstrate how effective the reactances at Deptford were. Mr. J. Shepherd (L.C.C. Tramways) estimated that the cost of the reactances advocated would be about 10 per cent. of the generator cost, and with the accessories, connections, &c., would reach 12 or 13 per cent. He thought that relay protective systems were more sensitive, as, in general, the short-circuits did not come on suddenly. The use of bus-bar reactances would necessitate a special room for their reception. If iron were used they would be very heavy. Reactance in the field circuits would be an advantage. Mr. A. R. Everest (B.T.H. Co., Rugby) said that the generator windings would be protected by internal reactance when built for 50 cycles, but for 25-cycle machines it was sometimes necessary to add external reactance, put as close as possible to the windings. Feeder reactance coils had the disadvantages of increased pressure drop and prohibitive space and cost, and could only be used if the feeders were grouped. Sectionalising the bus-bars by reactances accomplished much more. It limited the feeder current, permitted different currents in the different bus-bar sections, and protected the generator against a general short. The ironclad type of reactance was best on account of space, but in general the air core type was safer, and space should be found to house them. Mr. E. P. Hollis (G.E.C., Witton) showed how reactances could be used for many purposes other than those dealt with in the Paper. Mr. E. B. Wedmore (B.T.H. Co., Rugby) drew a distinction between series and parallel reactances, the latter taking little current and having little effect on the power-factor. He said that it was not commercially practicable to work stations of 100,000-kw. capacity without reactances. It was necessary to ensure somehow that no switch had to open the full 100,000 kw. No station of this size would be built without transformers stepping up to 20,000 or 30,000 volts, and these could have sufficient reactance to do for the feeders. The possibility of hunting had also to be looked into. He thought that a reactance of 20 per cent. for the bus-bars was sufficient, as above this the cost increased disproportionately. The magnetising current had to be supplied by the machine attached to each section, and, if too great, limited the output. It would be found best to cut down the size of the bus-bar sections as much as possible. The reactance of cables between individual consumers was valuable. Mr. G. C. Allingham pointed out that internal reactance would not protect the generator windings against pressure rises; and Mr. Faye-Hansen replied. He would not agree that air reactances were safer than ironclad reactances.

Royal Institution.—Among the lecture arrangements after Easter are two lectures by Prof. Silvanus P. Thompson on "Faraday and the Foundations of Electrical Engineering."

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,385.

A 50-h.p. shunt-wound interpole motor is used for driving a motor-boat direct on the propeller. During some trials with the boat moored, the speed of the motor was 30 per cent. under full speed while the motor was taking full load current. It was impossible to obtain a higher speed than this, as the current rose to a dangerous degree, while the shunt regulator was moved very slightly. Suggest the cause of this loss of speed and control, and state if better results should be expected with a trial under way.—"STOKER."

(Replies must be received not later than first post, Thursday, April 9th.)

### ANSWER TO No. 1,383.

I have a 30 h.p. three-phase motor, which is designed to run on a 365-volt circuit, at 580 r.p.m., 40 cycles. The only supply pressures available are 230 volts, and 625 volts, 40 cycles. What do you advise me to do?—"UTILITY."

The first award (10s.) is given to "P. B. F." for the following reply:—

Assuming that the motor is of the induction type, three cases will be considered: the number of poles and the speed will not be affected by the proposed changes.

If starting is performed by means of a star-delta switch and the rotor is of the squirrel-cage type, the only method

MESH CONNECTIONS.

For Star Connections, join A' B' C' together and A B and C to the three terminals.

available is to provide a three-phase auto-transformer with a ratio of approximately 625 to 375 or 230 to 375.

If starting is performed by means of a rheostat in the circuits of a wound rotor, and the existing stator is mesh-wound (see accompanying diagram of an 8-pole motor having

two slots per pole per phase), the three joints should be opened and the connections changed to star, when the motor will operate satisfactorily on the three-phase 625-volt circuit. There will probably be no difficulty as to the windings being sufficiently well insulated to withstand the higher voltage.

If starting is performed by means of a rheostat in the circuits of a wound rotor and the existing stator is star-connected, then the neutral point should be opened and the ends rearranged in mesh, as indicated in the figure.

Under these conditions the motor will run from the 230-volt three-phase circuit. The applied voltage will, however, be somewhat higher than the motor windings are designed for, and the higher flux density in the iron will result in higher iron losses. If the temperature-rise is already high under normal conditions (say 100° F. by the increase of resistance method), it will be advisable to keep the load on the motor somewhat below 30 h.p., so as to prevent injurious overheating.

The second award (5s.) is given to "R. W. J.," who writes as follows:—

The possibility, and also the advisability, of adapting plant to service under conditions other than those for which it is designed depend largely upon circumstances.

As the frequency of the motor in question is the same as that of the supplies available, transformers or auto-transformers could be utilised to obtain the required voltage, the motor then running under rated conditions, with a somewhat reduced overall efficiency due to transformer losses.

The cost of these, however, could be saved if the stator winding permits of rearrangement. (a) If, for instance, it is "mesh" connected and the insulation will allow, the phases may be put in star, when, with the same phase conditions, the terminal pressure becomes  $365 \times \sqrt{3} = 632$  volts, which is sufficiently near 625 volts to utilise that supply, particularly if the declared volts are exceeded, as is sometimes the case. (b) If, as is more probable, the windings are star-connected, they may be put in mesh, when the terminal

pressure for normal conditions would be  $\frac{365}{\sqrt{3}} = \text{over } 210 \text{ volts;}$

which is again not very far from 230. Local conditions will determine whether either of these methods, or modifications of such, are practicable. The speed will be approximately the same throughout, being the difference between synchronous speed (which in this case—apparently that of an 8-pole motor—is 600 r.p.m.) and the slip. This latter, with voltage below normal (case a), will be somewhat greater than normal (20 r.p.m.), giving reduced rotor speed; and vice versa in case b. The rotor circuit will in either case remain unaltered, unless the new starting current is found to have become too large (which is hardly likely), when the resistances will require readjustment.

Several other competitors give practically the same solution. One of them, "H. O. W.," suggests also that if the motor can be arranged to run off the 625-volt supply, it might be possible to start it up on the 230-volt circuit by means of a throw-over switch.

## ELECTRIC TRACTION NOTES

The Paper by Mr. T. Clarkson on "Recent Developments in Commercial Motor Vehicles," read last week before the Institution of Civil Engineers, although mainly devoted to steam and petrol omnibuses and other vehicles, contained some references to electric vehicles. He mentioned the great development of this form of road traction in America, and thought that in the congested traffic of London, where speeds were necessarily slow, their outlook was promising. He referred to the statistics collected by the Massachusetts Institute of Technology, showing the markedly greater economy of automobiles over horse haulage in many different circumstances. No comparative figures of costs, however, for electric and other types of vehicle were given. For motor-omnibus work it was impracticable to bring the weight within the new limit imposed by the police regulations, which now included the battery in the allowed weight of the vehicle, which was formerly not the case. Another interesting point taken up was the electric lighting of motor-omnibuses. In some petrol omnibuses the plain battery system was employed, but with the weight of battery permissible under the police regulations only a comparatively feeble light could be obtained. The dynamo and battery system gave better

illumination, but was more expensive and complicated. It was largely used on petrol vehicles, but in his own steam omnibuses had been superseded by a dynamo driven direct by a small steam engine without any battery. A simple design of engine was used, and in view of the variation in steam pressure it was supplied through a reducing valve. The set ran at 950 r.p.m., and gave 14 amperes at 12 volts. It was cheaper to instal and to maintain, and saved about 100 lb. in weight over the dynamo and battery system.

The question of the comparative economics of tramways and railless electric traction was considered by Mr. T. G. Gribble in a Paper read recently before the Institution of Civil Engineers. The trolley omnibuses put in service in this country up to the present time, says the author, are of the single-decked type, and have seats for twenty-eight passengers, but a double-decked omnibus with thirty-eight seats has been tested with satisfactory results. The average number of passengers per tramcar-mile ranges from 5'39 to 12'92, so if nine passages per car-mile be assumed, a single-decked omnibus should be able to carry the traffic. At Dundee on Saturdays and Sundays the receipts per omnibus-mile often average 25d., and at Rotherham, without excessive overcrowding, the average receipts for a considerable period were given as 13d. per mile. The cost of construction of a trolley-omnibus system may be taken as being that of a tramway (including power station) minus the track. The author quotes the results of some tests made on the "Electrobus" in 1908 on a run from Liverpool Street to Victoria. The average consumption of four east-bound trips was 144'1 watt-hours per ton-mile (the omnibus loaded weighed 7½ tons), and of four west-bound trips 123'3 watt-hours per ton-mile. Some tests at Bradford on a 5½-ton trolley omnibus in 1912, on a snow-covered macadam road, with several gradients, in a good state of maintenance, were also made. From these the conclusion is drawn that the maximum momentary demand on the power-houses when accelerating may range from 24 to 40 kw. When running full speed on the level the demand is 9'6 kw., so that if more than one omnibus is running, the capacity of the power station, 25 kw. with reserve for one omnibus, can be reduced. Supposing a daily performance of 105 miles per omnibus in service, with an average consumption of 0'9 units per omnibus-mile, the units per annum per kw. provided would be 1,380, a lower factor than it is usual to assume for large traction plants, and too high only for the smallest services. Assuming, also, the liberal allowance of £20 per kw., including buildings, a final estimate of £500 for the power station per omnibus in service is arrived at. The cost of upkeep of rubber tyres may be taken as 1½d. per omnibus-mile. The general conclusions reached are: (1) That with a traffic density represented by a 2½-min. service, the cost of working is in favour of the trolley omnibus by about 7 per cent., but the cost of construction is, however, about 44 per cent. less than that of a tramway; (2) that the saving increases inversely with the traffic density, so that with a time interval of thirty minutes the cost of working is about 36 per cent. less, and that of construction about 70 per cent. less. The idea that the economy of the trolley omnibus ceases at a service frequency of about ten minutes, is, in the author's opinion, quite unfounded.

Monday next should see the finish of the alterations at Charing Cross, whereby there will be complete interchange facilities between the District Railway and the Hampstead and Bakerloo Tubes. The Hampstead line is carried from the old terminus at Charing Cross in the form of a loop, part of which is under the Thames, to a single-line platform below the District station and parallel with the Bakerloo station further west. The diameter of the tunnel is 11 ft. 8½ in., which is increased to 12 ft. 9 in. on the curve under the river. From the western ends of the District platforms short flights of steps lead down to a circulating area divided into two sections, one under each of the platforms, and connected by a passage. In each section are moving stairways communicating with the Tube station below. On the west the stairways connect with the Bakerloo line (these were opened on March 2nd), and on the east with the new station of the Hampstead Railway. There is also a passage from the Hampstead line station to the foot of the Bakerloo stairways. The reconstructed station is to be known as Charing Cross (Embankment), and the original terminus of the Hampstead Railway as Charing Cross (Strand).

Although the Brighton Corporation advertised a short time ago for tenders for the equipment of their proposed omnibus routes, none of the tenders which have been received for cars, tyres, or line equipment have yet been opened. We believe this is due to unforeseen difficulties in agreeing with the

Hove Corporation, and the Brighton Corporation has fixed a period of three months as a time-limit before it will apply to the Board of Trade to appoint an arbitrator under the Act of Parliament to settle the difference between the two authorities.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Some extremely interesting experiments illustrated Dr. J. A. Fleming's discourse on "Long-Distance Telephony" at the Royal Institution on Friday. Use was made of cords of different thickness regularly vibrated by a motor and loaded in various ways by beads, to show the propagation of stationary waves in an electric line with different line constants, and with and without loading coils, and the reflecting effect of the loading coils was prettily demonstrated by this means. Another effective lecture-experiment was to project on the screen the oscillogram of a wave representing a complex sound transmitted through a cable at different points along the length of the cable, with the oscillogram of the original sound below it. The gradual disappearance of the higher harmonics was brought out very clearly. Dr. Fleming neatly divided the honours of the loaded cable between Heaviside and Pupin. Heaviside, he explained, had enunciated the law of the distortionless circuit, and had pointed out the importance of adding inductance, twenty-five years ago, but electrical engineers had not had sufficient confidence to act on his suggestions; in 1899 or 1900, however, Pupin had given the important law that the use of coils to increase the inductance was feasible if there were at least eight or nine in one complete stationary wave-length. The end-reflection effect when a loaded cable is used with an unloaded line at each end was clearly explained and demonstrated, as well as the remedy of tapering off the loading; and phantom circuits, and the method of loading the phantom circuit as well as the main circuits was briefly shown. No mention was made of telephone relays, and it was rather to be regretted that the short time devoted to wireless telephony (which hardly came within the scope of the title of the discourse) was not allotted to them. Coming to results in actual practice, Dr. Fleming said that the longest telephone line in use is now from New York to Denver, a distance of 2,000 miles; this had been rendered possible by the use of loading coils, and it was hoped to extend the line to San Francisco, making the total length 3,000 miles. The Berlin-Rome line just completed is 2,082 km. long, with loading coils 10 km. apart. In this country the Post Office is extending the use of loading coils rapidly on the trunk lines; at present they have 30,000 miles of wire fitted with loading coils, and a further 45,545 miles are being fitted with them. This includes the 50-circuit underground cable from London to Liverpool. The practice here is to insert loading coils one mile apart on cables and eight to ten miles apart on aerial lines. For submarine telephony a loaded cable 125 miles long is to be laid from England to Holland—hitherto the longest loaded submarine cables have been the Anglo-Belgian one, forty-eight miles long, and the cable to Ireland, sixty-four miles long. In concluding his discourse, Prof. Fleming predicted that when telephony between England and America is possible, it will be by wireless, and not by cable.

The Return of Patents, in respect of which royalties are payable by the Post Office to the Marconi Co., and the areas in respect of which they run, which was ordered to be printed in August last, is now available, and can be purchased through the usual channels for ½d. The number of patents in the list is thirty-five. According to the Marconi Co., royalties are payable on all these in Great Britain, on twenty-seven in Egypt, on nine in Singapore and Lahore, on five in the Transvaal, and on nine in India. It is pointed out in the memorandum that in no station will all the patents be used, nor is it certain which will be used until further progress has been made with the construction of the stations. In Egypt there is no law of patents nor copyright.

It was decided in the United States Council Court recently that the National Electric Signalling Co. (Fessenden's system) had infringed the patents held by the American Marconi Co., corresponding to Mr. Marconi's British Patent No. 7,777/00, and to Sir Oliver Lodge's British Patent No. 11,575/97.

The Persian line between Ahvaz and Mohammarch was down for a short while on March 28th, and failed again on March 31st. Recently, also, some derangement of the Key West route occurred.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published March 26th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

30,107/12. **Variable-Speed Dynamos.** B.T.-H. Co. (*G. E. Co., U.S.A.*). To maintain constant pressure across a variable speed dynamo a differential exciting winding is provided, and a resistor of carbon, tungsten, or tantalum, containing a material such as boron, having a marked negative temperature resistance coefficient, is used in series with one winding. There are several modifications. Eight figures.

5,292/13. **Discovery of Minerals in the Earth.** A. WILLIAMS. An electrode is fixed in the ground, and is connected through flexible wire and a galvanometer to a probing spike or drill, which, when it comes in contact with the hidden mineral, completes the circuit—the electrode and the mineral itself constituting a primary cell.

6,806/13. **Regenerative Motor-Control.** CROMPTON & Co. and H. BURGE. A motor is connected in series with a motor-generator across the line. There is a field winding on the motor through which the current is automatically decreased or increased as the motor speed rises or falls. This winding is connected between one side of the line and a choking coil across the armature, or through a slip ring to the armature. Two figures.

7,311/13. **Cable Armouring.** W. S. SMITH and H. J. GARNETT. The armouring of cables is protected against corrosion by gas pitch from which the free carbon has been removed by dissolving in toluol, filtering, and evaporating in a vacuum.

10,077/13. **Oil-immersed Switchgear.** A. E. G. Auxiliary spaces, provided with safety valves, and filled with air or inert gas, are in direct communication with the liquid. On an increase in pressure, due to gases formed during switching, the gas in the auxiliary space is compressed at first, but then drives the combustion gases out through vents provided for the purpose. One figure.

11,997/13. **Electricity in Agriculture.** R. M. MIES. Plants, fields, sown seeds, crops, &c., are treated with chemically manuring and sterilising substances, and simultaneously or subsequently a high-pressure A.C. current is applied. The pressure is automatically kept from exceeding about 80,000 volts and the current 30 milliamperes by the construction of the induction coil through which the energy is supplied. Electrodes are used to enclose uniformly the plants, crops, &c. Five figures.

12,246/13. **Sad-Irons.** W. H. DALTON. Flat heating coils are embedded in heat-conducting cement, while a layer of non-heat-conducting cement is used at the top. Five figures.

24,458/13. **Wireless Telegraphy.** J. W. LEE and J. L. HOGAN. The invention relates to an improvement on Feasenden's heterodyne receiver in that the artificial waves are controllable by combining the incoming and auxiliary waves before the energy reaches the receiver, and thereupon operating a detector and indicator. Five figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** DEBAUGE [Pumping apparatus for manufacture of tubes, wires, cable casings, &c., from molten lead or alloys] 5,639/13; SUNDERLAND [Bonding armoured cables] 15,286/13; JEFFERY [Porcelain] 16,396/13.

**Dynamos, Motors and Transformers:** NEWTON BROS., 5,926/13. **Electrometallurgy and Electrochemistry:** SCOTT [Starting furnace arcs] 6,136/13; SERPEK [Aluminium nitride] 24,731/13. **Heating:** BRIT. ELEC. HEATER Co. and KRATT [Liquid] 12,129/13.

**Ignition:** SWINNEY [Sparking-plug cleaning] 5,745/13; MALE [Sparking-plug socket] 18,728/13; HEINS [Engine starting] 24,457/13; FREIBERG and PETZSCHE [Sparking plugs] 357/14.

**Incandescent Lamps:** WALLING [Sintering metals] 14,795/13. **Instruments and Meters:** B.T.-H. Co. (*A.E.G.*) [Recording devices] 5,734/13; SIEMENS BROS. (*Siemens & Halske A.-G.*) [Feed control for recording instruments] 14,951/13.

**Switchgear, Fuses and Fittings:** WIDMER [Combined globe and reflector for incandescent lamps] 5,909/13; BENDIXEN and GONDROP [Time switches] 6,169/13; HART [Switches] 340/14; BIRCH [Conduit connections and fittings] 1,729/14.

**Telephony and Telegraphy:** SIEMENS & HALSKE A.-G. [Automatic telephony] 3,344/13, 3,431/13, and 12,060/13; KENNEDY

and TURNER [Telephony] 6,369/13; HASTINGS [Selective telephony] 9,986/13; DITCHAM and GRINDELL-MATTHEWS WIRELESS TELEPHONE SYNDICATE [Wireless telephony] 12,076/13 and 12,157/13; TELEPHON APPARAT FABRIK E. ZWIETUSCH & Co. [Telephony] 14,229/13.

**Traction:** SNOW [Communicating with and stopping railway trains] 5,854/13; ALLARD [Train signalling and control] 6,186/13; HUDSON [Automatic train stops] 14,336/13; Soc. d'ELECTRICITE NILMELIOR and COLAS [Railway signalling] 16,641/13.

**Miscellaneous:** HAY and SULLIVAN [Resistances] 22,375/12; KOLBASIEFF and BEKLEMISCHEFF [Detecting ice-burys] 5,887/13; CRAIG and PETER SPENCE & SONS [Finely divided copper] 6,161/13; BLADON [Battery lamps] 6,602/13; WOODS [Annealing wire] 12,872/13; SIEMENS & HALSKE A.-G., BANGERT and UTECHT [Exciting Röntgen-ray tubes] 13,903/13; FRIEDR. KRUPP A.-G. GRUSONWERK [Magnetic separators] 14,427/13; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Boron nitride] 16,468/13; SIEMENS BROS. (*Siemens & Halske*) [Lamp signalling] 17,713/13; RUSTON [Clocks] 19,268/13; FRESE [Wire-drawing] 19,276/13; ARCHIBALD BAIRD & SONS and BAIRD [Bell signalling] 28,350/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** WITTRIN [Fixing cable insulators] 5,240/14; REGAL [Insulators] 5,459/14.

**Dynamos, Motors and Transformers:** KETTERING, 4,762/14; HOLM-HANSEN [Compound transformers] 5,511/14; HERMANN [A.C.-D.C. transformer] 5,779/14.

**Ignition:** KETTERING, 6,072/14. **Switchgear:** A.E.G. [Connection of a number of conductors to one bus-bar] 5,467/14.

**Telephony and Telegraphy:** BETULANDER [Selectors] 4,819/14; LEIMBACH [Wireless] 5,535/14.

**Miscellaneous:** FRIEDR. HESSER MASCH. A.-G. [Release for drawing-off apparatus composed of weighing and measuring devices for use with goods-packing machines] 3,004/14.

The following Amended Specifications may now be obtained:—

**Electrochemistry:** H. M. DU BOIS [Electrolysis and electrolytic cells] 1,420/13 and 1,439/13.

### Amendments to Specifications

19,257/12. **Clocks.** L. J. ARON, C. WIENER, and the X.L. ELEC. Co. Owing to the extended investigation under Sect. 8 of the Act a disclaimer has been added to the specification, which describes an electrical driving gear for clocks, &c.

### Grant of Patent Allowed

22,041/12. **Tungsten for Drawn-wire Lamps.** H. LEISER. The Comptroller has allowed the Grant, in spite of the opposition by the B.T.-H. Co., of this Patent (ELECTRICAL ENGINEERING, Dec. 25th, 1913, p. 728, Vol. IX.).

### Grant of Patent Refused

2,546/13. **Mine Signalling.** J. CLOSE. The Comptroller has now refused the Grant of this Patent.

### Appeal from Comptroller's Decision

25,606/12. **Time Elements for Circuit-Breakers.** J. G. STATTER. An appeal has been lodged by the opposers against the Comptroller's decision to Grant this Patent.

### Appeal against Grant Withdrawn

20,207/11. **Sparking Plugs.** H. G. LONGFORD, W. W. LONGFORD, and W. A. CLARK (Sphinx Mfg. Co.).

### Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems:** W. A. STEVENS, 26,674/08.

**Dynamos and Motors:** C. DE KANDÓ [Stator winding of railway motors are embedded in an insulating material, which is melted and escapes, to be replenished, if the temperature rise is too great] 25,759/05.

**Electrochemistry and Electrometallurgy:** A. HIORTH [Induction furnaces] 28,370/06.

**Storage Batteries:** B. J. B. MILLS (*T. A. Edison, U.S.A.*) [Cleaning iron strips for the Edison battery] 26,947/04; [Construction of the Edison battery] 26,949/04.

**Switchgear, Fuses and Fittings:** CALLENDER'S CABLE Co. and J. C. A. WARD [Contacts for switches and fuses] 25,614/05.

**Miscellaneous:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [Electrolytic lightning arresters] 27,224/07; C. DAVIS [Electrically firing torpedoes] 22,376/08.

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

### AUTOMATIC CONTROLLERS FOR MINES

IN the course of a Paper dealing with Automatic Controllers for Mining Work, by Mr. G. W. Humphry, read before the Association of Mining Electrical Engineers (South Wales Branch) on Saturday, March 21st, the author described a motor starter which had met with success in works and mines. It was necessary that motors working mine machinery should continue to run under all conditions except heavy overloads. The pressure variations were sudden and heavy, and if the no-voltage mechanism failed to release on a drop, then the sudden return of the normal or higher pressure was likely to cause the motor to flash over. With automatic starters a pressure relay could be used which, on a pressure-drop of about 10 per cent., would drop out, opening the control circuit of the accelerating switch, which dropped in turn and cut into circuit the heavy duty starting resistance. This should have a capacity for continuous service at low pressure. The motor should then run at a low speed, until, when the pressure had again reached 90 per cent. of the normal, the relay pulled in again, cutting out the resistance and permitting the motor to accelerate to full speed. For motors for haulage and pumps, &c., above 75 h.p., contactors should be used. The period between the working of one contactor and the next, which governed the rate of acceleration of the motor, was controlled by series relays or by the pressure-drop in the controller resistance. The latter was the simplest, most effective, and most satisfactory where the pressure of the supply could be relied upon for steady regulation, but where, as was generally the case in mines, there were pressure fluctuations of 5 per cent. or more, acceleration by the series relay was essential, and by it close results could be obtained. The author then dwelt on the necessity for protecting the connected apparatus by means of effective safety devices. Limit or relay switches could be so connected in the motor circuit that in case of temporary overloads, all contactors except the first one opened circuit; the whole of the starting resistance was then in series with the motor armature, which continued to rotate slowly until the overload was removed, after which it would accelerate, as in first starting, to normal full speed. This device was of special value in the case of haulages or coal-cutters, as when there was an obstruction, the armature resistance was automatically cut into circuit, the motor slowed down until the obstruction was removed. With a circuit-breaker hand-set relay in circuit, in case of a dangerous overload—such as the derailment of the trams by falls or timber—all the contactors could be made to operate at the same time and completely disconnect the motor from the supply, the blow-out coils promptly disrupting any arc that might arise between the contactor fingers. It was important to observe that the relay was automatically held open until the hand-set relay had been closed and energised, preventing the motor from automatically starting until the normal conditions had been restored and the source of trouble removed.

On the question of machine drive the author said that belt drive, though now generally used, was gradually disappearing. Where the motor was direct-coupled to the machine shaft, two methods of automatic control were generally resorted to in order to avoid the heavy current peaks, and to obtain as nearly as possible smooth running of the machines: (a) By starting and accelerating, stopping at the end of the stroke by dynamic braking, and reversing by applying reversed power to the motor; (b) by disconnecting the motor entirely from the line when the machine was on the point of reversal and immediately applying reversed power. When the master-switch was turned to the "on" position the power was thrown on the motor armature with resistance in series; this was then automatically short-circuited, and the motor ran as a compound interpole, automatically closing the short-circuiting switches of the shunt, and the series fields connected the motor as a shunt machine for constant speed with full shunt. The shunt resistance switch was then automatically opened. This caused the motor to attain its predetermined speed. When the tappet device attached to the planer platen threw the master-switch, all the automatic

switches returned to their original positions, and power was applied in the reverse direction.

The question of the control of A.C. motors was then briefly dealt with. The most common way of obtaining automatic starting was by reduction of the stator pressure by means of resistances, or by the use of auto-transformers for single-phase and squirrel-cage motors, and the insertion of resistance in the rotor circuit of slip-ring machines. Star-delta switches could be used in certain cases, and could also be set for automatic working.

### AN ELECTRICAL WINDING PLANT IN FRANCE

A MAIN shaft electrical winding plant, worked on the Ward Leonard control system with flywheel power equalisation, has been put down recently by the Société Alsacienne de constructions mécaniques, of Belfort, at the Landres iron mine of the Micheville Steel Co. The set has been installed at the head of a secondary shaft, and an electrical system was particularly convenient owing to the establishment of a three-phase generating station to supply current for a large amount of electric pumping which is carried on continuously. Thus the question of generating plant for the winder could be met economically by a comparatively small increase in the size of the main generating sets. The winding plant is designed to raise 3 tons of ore from 760 ft., and to make ninety trips per hour, with an actual winding time of 30 secs. The system chosen, although involving a motor-generator with a large flywheel, gives excellent control, and shields the generating plant from peaks in the load, both matters of importance, considering the frequency of the trips. There are two conical drums coupled together and direct driven by a single continuous current main winding motor, separately excited and supplied with current at a variable voltage from the flywheel motor generator. The whole control is by one lever, which varies the excitation of the flywheel generator, and by this means regenerative braking as well as speed control is obtained. A full equipment of mechanical brakes worked by compressed air is also provided, and the usual very complete safety devices are fitted, by which the brakes are applied in event of failure of the compressed-air supply, overrunning, failure of current, or increase in the cage speed above a certain value. There is complete interlocking between the electrical and mechanical brake gear. The main control lever is also interlocked with the depth indicator in such a way that it is gradually returned automatically to the off position, slowing down and stopping the machine at the end of the travel, even if the driver fails to do so.

The main winding motor is connected to the drums by a coupling that can easily be dismantled. It is fed at voltages varying from 0 to 500, and runs at a maximum speed of 41 r.p.m., giving outputs up to 1,000 h.p. It is fitted with commutating poles, and is separately excited from the station bus bars at 500 volts. The equalising motor-generator consists of a 450-h.p. three-phase induction motor running at 485 r.p.m. maximum speed, driving the variable voltage continuous current generator, which feeds the main winding motor. The flywheel, which weighs 15 tons, and is made of one solid steel casting, is coupled to these machines by a flexible coupling, and the automatic slip regulator allows for a reduction of speed to 410 r.p.m. to enable the flywheel to give out its stored energy when required. In event of a breakdown of the flywheel motor-generator, it is possible to run the winding motor direct from one of the two 600-kw. 500-volt continuous-current steam-driven sets in the generating station. When this is done, the set is taken off the bus bars and connected straight on to the winding motor, and a special rheostat is used in its field circuit. This can be connected up so as to be worked by the same control lever that normally regulates the motor-generator excitation, so that the method of control is in no way altered. The plant, which is described in *L'Electricien* and elsewhere, is reported to be working with great regularity, and the perfection of the control apparatus renders it possible to maintain the rapid rate of working of ninety-five trips per hour without difficulty.

## PATENT LOUD SPEAKING TELEPHONES

COMPLETE INSTALLATIONS FOR

**WARSHIPS, MERCANTILE VESSELS,  
MINES, POWER STATIONS, ETC.**

Adopted by the British Admiralty, Foreign Governments,  
the Leading Shipping Companies, and as used in many  
Electrical Generating Stations.

**ALFRED GRAHAM & CO.,**  
ELECTRICAL ENGINEERS AND CONTRACTORS,  
ST. ANDREW'S WORKS, CROFTON PARK, LONDON.

## THE "HATFIELD" PUMP

Merryweathers' Patents.

*A Client writes:—*"The 'Hatfield' Pumps at this Hotel are particularly successful, especially as regards their silent working. In many hotels one stops at, you can hear the hammer of the pumps vibrating through the whole building, which is very irritating to visitors. Many a comfortable night a man spends in his bed at this Hotel, without being disturbed by 'the hump of the pump.'"

## THE PERFECT PUMP

FOR

ELECTRIC DRIVING  
MANSION WATER SUPPLY  
COUNTRY WATERWORKS  
SHALLOW WELLS

DEEP WELLS  
AUGMENTING PRESSURE IN  
FIRE MAINS  
FILLING RESERVOIRS, &c., &c.

ARDWICK, MANCHESTER.

## ELECTRIC WINDING AND ROLLING MILL DRIVE

A PAPER on "Electric Winding" was read by Mr. J. Gillespie recently before the East and West of Scotland Branches of the Association of Mining Electrical Engineers, and before the Warwickshire and South Staffordshire Branch on Saturday last. The author began by dealing with the advantages of electric power for all purposes in collieries, and quoted the results of tests conducted by the Coalowners' Institute of the Westphalian district of Germany, in association with the Boiler Inspection Society of Dortmund, which were very favourable to the Ilgner winding sets used in the tests. The author then referred to the Ilgner-Ward-Leonard winding set installed at the Cobbinshaw Pit of the Tarbrax Oil Co. (now absorbed by the Pumpharston Oil Co., Ltd.) by Bruce Peebles & Co. (see ELECTRICAL ENGINEERING, Feb. 21st, 1907, p. 332, Vol. I). Later an Ilgner set was installed at the Breich Pit of the Pumpharston Oil Co. by Siemens Bros. Dynamo Works. The braking is carried out by a compressed-air engine acting against a counterweight, the pressure tending to keep the brakes in the "off" position. During ordinary routine winding the brake is controlled by the engineman through a hand-lever. Should the emergency brake come into operation at any time the connecting lever opens a switch in the main generator field, and thereby prevents the motor from being driven against the brakes. The emergency brake comes into operation on failure of the power supply, of the air pressure, or of an overwind, as well as by the engineman. A limit switch at the pit-head is connected to a trip lever which may be operated by either cage overrunning the deck by about 2 ft. By means of a speed-limiting switch at the pit-head, the pit-head man can limit the speed of the cage for winding men to half that for winding coal by limiting the controller handle to half-range. The torquing motor is energised from three transformers whose primaries are in the main motor circuit. Acting against a counterweight, it is called upon to close a relay circuit, the actual insertion of the resistance being performed by a small D.C. motor withdrawing the dippers from a liquid starter. The exciter-generator is included as part of the motor-generator set, which is made up of the main induction motor, variable-pressure generator, auxiliary generator, and flywheel. By this arrangement several complete winds may be undertaken in the event of a power-house or line breakdown, as there is sufficient energy stored in the flywheel. The fluctuations of the flywheel speed are compensated for by an automatic pressure regulator inserted in the field circuit of the auxiliary generator. The whole winder, including the motor-generator, is protected against over-speeding, either accidental or through neglect on the part of the attendant. The depth of the shaft is 72 fathoms, and the time per wind is twenty seconds. The indicator pillar has attached to its worm screw a series of tappets, which act upon a lever fitted with a freely-moving roller. Upon the tappets moving in a downward direction toward the completion of a wind, they press upon the roller, bringing the controller and its handle to the zero position. An additional trip cuts off the current and applies the brake, should for any reason the tappets fail to bring the cages to rest. The working is so smooth that there is no necessity to apply the brake at the completion of a wind. The cost of the equipment was about £3,000, and, when winding coal two shifts per day, 120,000 tons per year, or 37 tons per hour, can be drawn. Taking interest at 5 per cent. and depreciation at 10 per cent., the author obtains a cost of 2'35d. per ton raised, compared with 2'62d. with steam winding. It appears also that the electric winder could draw much more coal per wind than it does at present.

Another Paper dealing with winding and rolling mills is "Power Economies for Intermittent Loads," read before the Rugby Engineering Society, by Mr. E. Ivor David. The author dealt first with steam and electric winding, Ward-Leonard system, and by means of examples showed that commercially electricity for main winding deserves consideration in every case, and in most shows a decided advantage. On the question of rolling-mill drive the author showed that in the case of a tin-plate mill driven by a 160-I.H.P. compound engine costing, complete, about £3,400, an induction-motor drive could be substituted at a cost of about £4,300. Contactor-type slip regulators, working in 1/50 sec. are available, and these have proved sufficient for the most severe rolling-mill purposes, but ordinary motor-driven slip regulators of the liquid or metallic type are somewhat sluggish in their action. D.C. motors are also used for driving continuous-running rolling mills. When used in conjunction with flywheels, the addition of series windings to the main field produces the necessary speed drop with increase of load. In

merchant mills, which usually roll a great variety of sections, it is an advantage to be able to vary the speed of the mill motor, and D.C. motors are best for this purpose. The driving of a 36-in. cogging mill by steam and by induction motors is then considered. The examples given show that the electric motor, owing to its high and uniform starting torque, high overload capacity, reliability, and small size and weight, compared with other engines, is particularly adapted to reversing or intermittent loads. In some cases electric equipments are slightly higher in first cost than plain steam equipments, but wherever electric power can be purchased or produced at less than 0.35d. per unit, and in many cases up to 1d. per unit, reduced running costs can be proved.

The author concludes: "In every case where the electric motor drive for rolling mills or winding engines has been installed, an increase in output over steam engines of similar capacity has been obtained. The numerous safeguards against overload or abuse which can be introduced into electrical equipments, have proved of such value that no serious breakdown of electric motors in this service has been recorded."

### ELECTRICAL MINING AND METALLURGICAL PATENTS OF MARCH

#### Mining.

THE following patents, the specifications of which were published by the Patent Office during March, are of peculiar interest to mining electrical engineers:—No. 17,816/13, by R. Nicholas, of Treorchy, South Wales, deals with a method of adapting mechanical signalling to conform with the Act of 1911. A contact-maker is fixed to the "rapper" or "knocker," so that when a signal is pulled from the bottom of the mine the same pull completes an electric circuit reproducing the signal in the winding-engine house. The contact-maker is made of two halves of an insulated splitting. Between these is a movable pin with a cone-shaped head, all enclosed in a watertight box. No. 5,467/13, by A. Philip and L. J. Steele, of Portsmouth Dockyard, relates to catalytic gas detectors, and covers the use of resistances joined to a catalytically-active and to an inactive wire, connected as a bridge, and a sliding connection, adjustable, for example, by a screw, between the resistances and the battery or indicating instrument, as a means of obtaining an initial zero reading.

#### Metallurgical.

These patents are of special interest to electro-metallurgists:—According to specification No. 3,554/13, by G. H. Benjamin (New York), the manufacture of cement steel is effected by heating the iron or steel by alternating current of 25 or more cycles per sec. frequency in the presence of gas under pressure containing carbon. Specifications Nos. 22,744/13 and 22,745/13, by N. V. Hybinette (Christiania, Norway), deal with the electrolysis of copper solutions containing iron. According to the first specification, the electrolyte is circulated between the anode compartment and the copper leaching tanks, so that the copper to be recovered passes to the cathode through a porous partition. The second specification deals with a process for the extraction of copper from material containing it partly as oxide and partly as sulphide. After leaching with an acid sulphate containing much iron, of which only a small quantity is oxidised to the ferric state, then electrolysis the solution in cells without diaphragms, and interrupting the electrolysis before sufficient iron is oxidised to ferric sulphate as to interfere seriously with the plating, the solution is again leached and the copper left in the ore by electrolysis by the use of some of the solution, previously oxidised so as to contain a larger quantity of ferric sulphate, in an electrolytic cell with diaphragms.

Specification No. 25,163/13, by the British Thomson-Houston Co. and C. H. McCarthy-Jones, deals with rolling-mill and winding-engine driving. The invention consists in the use of a Tirrill regulator to act directly on the fields of a motor-generator set. In a previous specification the system described was the same, except that an auxiliary machine was used between the regulator and the motor-generator.

The following three patents relate to welding. No. 27,496/12, by E. H. Jones (London), relates to a method consisting in connecting the work to one pole and a single water-cooled welding roller to the other. The welding current is supplied at a low pressure, e.g., at about 2 volts. No. 19,512/12, by R. Mack (Germany), relates to a single-phase low-pressure

## FOR BRITISH MANUFACTURED PAPER INSULATED CABLES

# THE UNION CABLE CO., LD

DAGENHAM DOCK,  
ESSEX.

transformer for welding, smelting, &c., consisting of a secondary in the form of a protective casing completely enclosing the core and primary; and No. 24,472/13, by J. M. Yount, T. Finigan, and E. S. Brannaman (U.S.A.), relates to an apparatus especially intended for welding railway rails. A skeleton framework is mounted on wheels and has resistance elements arranged in groups in series. The welding tool is connected at points on the resistances, according to the current required. An enclosure is also provided.

In specification No. 14,426/13, Friedr. Krupp A.-G. Grusonwerk (Germany) claims a magnetic separator in which the material to be treated travels across the field in the same direction, relatively to the co-operating magnet pole, as the travel of the surface to which the particles are attracted. These are sub-divided by planes parallel to the direction of travel of the material into fields of different strength.

**The Association of Mining Electrical Engineers.**—Among recent Branch meetings during the last month was a combined meeting on March 7th of the Yorkshire Branch with that of the Association of Colliery Managers, when a Paper by Mr. A. Anderson on "Electrical Transmission in Mines" was discussed. The Paper dealt largely with underground work. A meeting of the West of Scotland Branch was held on March 20th at Glasgow, when Mr. C. E. Hart read a Paper on "Rock Drills," and Mr. J. Gillespie's Paper on "Electric Winding in Collieries" was discussed. The last meeting of the Branch will be the annual general meeting on April 22nd. At a meeting of the East of Scotland Branch on March 20th, Mr. S. P. C. Kinlen's Paper on the "Choice of Electrical Machinery for Use in Mines" was discussed. The branch visited the electrical winding gear of the Pumpherstone Oil Co. at Midcaldor on last Saturday.

**"Waste" Power.**—At a meeting of the Cleveland Institution of Engineers recently Mr. J. H. Harrison read a Paper on "Some Notes on the Manufacture of Iron and Steel," in which he called attention to the large amount of surplus power available from blast furnace gas in the district, which was now being utilised by the Cleveland & Durham Power Co. Something like 1,750,000 units per week were being generated in this way at a lower cost than anywhere in the United Kingdom, with great benefit to the district. He looked forward to a further movement in the direction of linking up the smaller ironworks in this way.

## “ELECTRICAL ENGINEERING” TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 199. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**CALENDAR.**—A useful calendar, with a table of equivalents of British and foreign measures, weights, and moneys is to hand from Rosenblum's Translation Bureau (26 High Holborn).

**VACUUM CLEANERS.**—A list from the Electric Suction Cleaner Co. (151 Queen Victoria Street, E.C.) describes the Frantz electric suction cleaner, which is of the self-contained domestic type, with the motor and suction fan mounted in the same casing as the nozzle, which also contains a revolving brush. The apparatus is light and compact, and can either be wheeled about complete for carpet cleaning, &c., or used in conjunction with a flexible hose.

**SIGNALLING BATTERIES.**—A leaflet from Siemens Brothers & Co., Ltd. (Woolwich), gives particulars of a form of large Leclanché cell specially designed for use in connection with railway-track circuit signalling.

**HEATING AND COOKING.**—We are in receipt of a booklet from Ferranti, Ltd. (Central House, Kingsway, W.C.), suitable for distribution among likely consumers. It is of convenient size for enclosing in the ordinary business envelope, and so can be sent with accounts, &c. The company intimates that it will be pleased to supply quantities of the booklet to contractors and supply authorities for this purpose. On the front is a picture of two little boys in a bathroom warming before a Ferranti Fire, and inside the advantages of electric heating and cooking are given, with calculations showing a monetary gain in the latter case.

**SCHOLEY'S MAGAZINE.**—The March issue of this interesting little publication commences with an illustrated sketch of the career of Mr. J. F. C. Snell. A description follows of an automatic lift installation, and some interesting particulars are given of the tool steel gears and pinion which the firm are supplying to the London & South Western Railway, which are of much larger size than has been the usual practice hitherto, the gear-wheels being 30½ in. in diameter. Scholey & Co. have also the order for the gears for the London & North Western Railway electrification.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**TELEPHONES AND BELLS.**—The Sterling Telephone & Electric Co., Ltd. (210-212 Tottenham Court Road, W.), has just issued an illustrated catalogue of 160 quarto pages dealing with telephones for every conceivable purpose, bells, indicators, fire alarms, batteries, wires, &c. The Sterling "Primax" system of automatic interphones is included. This system is one in which a central battery is used, and it is claimed that induced cross-talk is so far eliminated that in a system of 30 lines the maximum number of conversations can be carried on simultaneously without confusion. Only two additional common wires are required in the cable. Replacing the receiver or hand-set automatically disconnects the switch, and it is only necessary to move the line selector when making a call. A new set named the "Factory" interphone has been designed to stand rough handling in works, engineering shops, railway yards, &c. Other items include secret interphones with lamp signals, a comprehensive range of telephones and bells for use in mines as well as blasting sets, all complying with the Home Office requirements. Finally, mention may be made of the new range of cables for interphone systems, with enamelled wire conductors, a special clock for timing trunk calls, a conversation counter for checking message rate accounts, the "Ferro-Case" instruments, and the G.P.O. sets.

**"THE E.C. JOURNAL."**—The March issue of the interesting little magazine published by the Electrical Co., Ltd. (Charing Cross Road, W.C.), describes some small electrically-driven pumps, and gives some views of the works where the Company's small motors, &c., are made. Some candle-power and consumption curves relating to the Nitra or half-watt lamp are given, and other subjects dealt with are electric signs and meters. There is also an extensive list of motors which the Company have in stock in London.

### ELECTRICAL EQUIPMENT OF A BAKERY

THE application of electric power and lighting offers particular advantages in the baking industry, on the grounds of cleanliness, convenience, and economy.

An interesting example of an electrically-worked bakery is that of Messrs. J. & B. Stevenson, at Cranstonhill, Glasgow. The first move in the conversion to electric power was the installation in one of the bakehouses of a 60-B.H.P. motor by the British Thomson-Houston Co. (Rugby), to replace a steam

FIG. 1.—60-H.P. MOTOR DRIVING KNEADING MACHINE, &c.

engine and boiler, thereby saving a great deal of floor space. This motor is suspended by steel hangers from the ceiling of the ground-floor, and connected by belting and counter-shafting to two groups of machines consisting, respectively, of two kneading machines, one dividing and handling machine, two stirrers, and a ventilating fan on the ground-floor, and two kneading machines and one dividing and handling machine in the basement. It is ultimately intended to

FIG. 2.—30-H.P. PIPE-VENTILATED MOTOR DRIVING KNEADING MACHINE, FLOUR SIFTER, AND CONVEYOR.

instal a duplicate motor on a third floor, where it will replace a gas engine driving a lift, two kneading machines, one stirrer, a fruit cleaner, and automatic machines, with provision for its being connected to the main shafting on the lower floors.

In the latest premises of this firm two floors are com-

pletely equipped with electrical drives, and two others are to be similarly equipped at a later date. Two motors are used, of 30 and 12 B.H.P. respectively. These were also manufactured by the British Thomson-Houston Co., Ltd., and are of the pipe-ventilated type, specially designed for use in a dusty atmosphere.

The first group of machines driven by these motors consists of two kneading machines, flour-sifter with elevator and conveyor, and a stirring machine; and the second group, of automatic plant—chaffing machines, prover, and handing-up machines. By means of a clutch on the counter-shafting the two groups of machines may be connected together, so that either motor alone may be utilised to drive the automatic plant and a limited number of the other machines. Substantial terminal boxes are fixed to the motor frames, and the whole of the wiring between the motors and control panels is enclosed in metallic tubing. The control panels, which are fitted with no-volt and overload releases, interlocking shunt regulators, and fuses, thus effectively protecting the motors from injury due to careless starting, &c., are enclosed in glass-fronted cast-iron cases through which the control handles project. Special push-button switches are fitted beside the handing-up machine of the automatic plant to enable the attendant to stop the machine immediately if necessary.

The supply is obtained from the three-wire system of the

FIG. 3.—PIPE-VENTILATED MOTOR DRIVING KNEADING MACHINES, AUTOMATIC PLANT, &c.

Glasgow Corporation. The incoming leads are connected to a main switchboard in the basement, where connections may be made to distribution boards situated at convenient central positions on each floor. Satisfactory lighting is obtained by the use of 30-watt 250-volt metal filament lamps connected between the outers and the neutral, while the motors are connected across the 500-volt outers. In addition to the fact that the electric drive offers the best conditions for clean and efficient work, the low cost of such an installation as that described above should be a strong recommendation for its adoption. It is always difficult to obtain reliable information as to the relative cost of various methods of power supply, but, as a guide to firms who may be considering the installation of electric equipment, we refer to statistics issued by the Corporation Electricity Department relating to various trades in Glasgow and Birmingham, where it is mentioned that the cost of current supplied to bakeries in these towns during 1913 was as low as £1 19s. and £1 16s. 7d. respectively per horse power installed.

The above schemes were adopted on the advice of Messrs. J. & B. Stevenson's Consulting Engineers, Messrs. James E. Sayers and Caldwell, of Glasgow, who prepared the specifications and supervised the work.

### A "FOOL-PROOF" INCHING STARTER

WE recently had the pleasure of inspecting a new design of "fool-proof" inching motor-starter, which we understand has been patented, during the course of a tour round the works of the Electrical Apparatus Co., Ltd. (Vauxhall Works, South Lambeth Road, S.W.), where we saw a quantity of unit-type ironclad switchgear for mines in all stages of manufacture, lift controllers, meters, &c. In the case of the motor-starter, the automatic features are obtained by means of a no-volt and overload release circuit-breaker, interlocked in such a way that the motor cannot be started unless all the starting resistance is in circuit. This eliminates the ordinary no-volt coil and spring return. The main circuit is always made and broken by a contactor of ample size, which is provided with two carbon breaks and a magnetic blow-out. The main lever (see illustration) may be con-

sidered as a plain starter without any automatic features and without an "off" position. This lever carries an insulated plunger which slides over a small sector on the starter front. The upper end of this insulated plunger carries a copper roller. Superimposed upon the main lever, and pivoted on the same spindle, is a cradle which carries the operating handle, and is free to move through a small arc. This superstructure carries an uninsulated plunger, which, when the handle is moved forward, makes contact with the insulated copper roller on the main lever. A small spring tends to hold these two contacts apart, so that they will only make contact while the handle is being moved or held in a forward direction, and will immediately open when the handle is released. A heavy pressure can be maintained between the standing lever and the segments, of which there are a large number. As the main circuit is always made and broken on a separate contactor, there is no sparking on the starting contacts. A carbon roller is provided on each segment, but this is only for the purpose of taking the small spark when advancing from step to step. The circuit cannot be broken on the segments, and it is impossible to move the starter arm backwards in the slightest degree without first opening the contactor. If the starting handle is let go at any period

"FOOL-PROOF" INCHING STARTER.

of starting, the contactor instantly opens and the motor stops. The no-volt and overload releases are independent of the starter arm, and out of control of the operator. The starter therefore embodies the function of a loose handle no-volt and overload release circuit-breaker. If at any period of starting or running the supply fails or the overload release operates, the contactor opens, as above described, and it is impossible to start again until all the starting resistance has been re-inserted by bringing the starter arm to the "off" position. The contactor current is always reduced to its "holding" value by a small copper-carbon switch worked by the contactor itself. Furthermore, it is not possible to burn out the contactor solenoid by staying too long on the starting position, as the action of the switch is instantaneous. Apart from the slate base and starting handle, there is no insulation on the starter proper, with the sole exception of an ebonite bush  $\frac{1}{4}$  in. thick round a small plunger. In the foregoing description only one contactor has been referred to. By adding another one in the other pole a complete panel is obtained with full protection, but only one handle for operation. Some of these starters are already in practical use, and their many important features render their investigation by users of this class of apparatus desirable.

**Half-Watt Lamps for Street Lighting.**—The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), point out that the Metropolitan Electric Supply Co. may lay claim to the first half-watt installation for street lighting in London, as previous to January 16th they installed a 105-volt 1,500-watt Osram half-watt lamp at the corner of Vernon Place and Southampton Row, W.C. The lamp is contained in a lantern originally used for a cluster of three standard tungsten lamps, a new reflector having been fitted to accommodate the single unit. These lanterns were illustrated in *ELECTRICAL ENGINEERING*, Vol. VIII., page 633, November 14th, 1912. The result is extremely good and the illumination remarkable when compared with the high-pressure gas lighting in the vicinity.

## INDIRECT LIGHTING

THE objection has sometimes been raised in the case of indirect lighting fittings of the suspended bowl type that the unilluminated under-side of the bowl makes an unsightly dark spot amid the uniform illumination. The British Thomson-Houston Co. (Mazda House, 77 Upper Thames

FIG. 1.—LUMINOUS BOWL INDIRECT LIGHTING FITTING.

FIG. 3.—INTERIOR OF STANDARD, SHOWING INVERTED REFLECTOR AND LAMPS FOR DIRECT ILLUMINATION.

FIG. 4.—TABLE STANDARD FOR COMBINED DIRECT AND INDIRECT LIGHTING.

Street, E.C.) has now introduced some indirect lighting fittings in which this objection is entirely done away with by having the lower part of the bowl of delicately-tinted translucent glass illuminated by a small auxiliary lamp within the fitting. The direct light given in this way, amounting

FIG. 2.—ARRANGEMENT OF LAMP AND REFLECTORS.

to about one-tenth of the total, does not materially assist in the general illumination as in true "semi-indirect" lighting,

but improves the appearance of the fitting very much, without sacrificing any of the advantages of fully-indirect lighting. One of these fittings is shown in Fig. 1, and the arrangement of the lamps is seen in Fig. 2. A fine example of this system is to be seen in the lecture theatre of the Royal Institution, where it has replaced a very large fully-indirect fitting.

Hitherto the table or floor standard has not been considered or employed as a general lighting unit, but its usefulness has been confined to the local illumination of a desk or table. The Company, however, has designed a new form of standard lamp, which, while possessing all the features of the ordinary standard lamp, can, if required,

be used for the general illumination of the room. In appearance, it does not differ greatly from ordinary patterns, but concealed within the shade is a single upturned silvered glass reflector. The light is thrown on to the ceiling and reflected down into the room again, in the same way as with suspended "Eye-Rest" indirect lighting fittings. In addition to this indirect unit, there are also two or three moderate-sized lamps uniformly spaced around the pedestal underneath the reflector. These lamps can be used for the direct illumination of a table or desk. These lamps are separately switched, so that it is possible to use the fitting either for indirect or direct lighting, or a combination of both. For example, a low, uniform intensity of light from invisible lamps may be used for the general illumination of the room, while the table or some other selected spot can be more intensely lighted for the purpose of reading or writing. Those who are attracted by indirect illumination, but who have not installed it because of the presumed necessity for changing their ceiling fittings, should welcome the new "Eye-Rest" standard, which can be placed anywhere in the room and connected either to a wall-socket or lamp-holder. Both floor and table standards are made; but, of course, care must be taken to see that they are of sufficient height that from no part of the room can the reflector be looked into.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Bootle.**—Two 500-600-kw. rotary-converters, transformers, and switchgear. Town Clerk. April 22nd.

**Devonport.**—An inquiry was held last week into a loan of £19,466 for electrical extensions.

Tenders are invited for a 1,250-kw. turbo-alternator with condensing plant, and two 500-kw. rotary-converters and switchgear. Borough Electrical Engineer. April 8th.

**Farnworth.**—Switchboard and cables. Borough Electrical Engineer. April 18th.

**Edinburgh.**—Switchboard extension. Consulting Engineer, Sir Alexander Kennedy, 17 Victoria Street, London, S.W. Tenders to Town Clerk. April 20th. (See advertisement on another page.)

**Leeds.**—A scheme involving an expenditure of £200,000 on new plant is now before the Corporation. Mr. C. H. Wordingham has reported upon the Corporation's electricity undertaking, and the new plant is to consist of a 12,000-kw. turbo-alternator, condensing plant, six boilers, switchgear, &c., at the Whitehall Road Works.

**Peterborough.**—A loan of £2,000 is to be taken up for mains, and £600 for services.

**Plymouth.**—Extensions of cable are contemplated in a number of streets.

**Rathkeale.**—The Rathkeale Electric Lighting & Power Co. invite tenders for suction gas-engine plant, dynamos, storage battery, switchboard, cables, and street lighting equipment. Consulting Engineer, L. J. Lawless, 27 Castlewood Avenue, Rathmines, Dublin. April 18th.

**Rawtenstall.**—A Local Government Board inquiry was held last week concerning a loan of £10,000 for electrical extensions.

**Rochdale.**—An electrically-driven crane is required for the electricity works.

**Skelton.**—A Local Government Board inquiry has been held concerning a loan of £9,250 for electric lighting purposes.

**Sunderland.**—The Borough Electrical Engineer has reported replacing the rubber cables on the low-tension system, and also as to further additions to the plant.

**Wallasey.**—Tenders are invited for the plant for the Council's new generating station. April 7th. Borough Electrical Engineer.

**Warrington.**—Twelve months' supply of motors and transformers. Borough Electrical Engineer. April 14th.

**Wigan.**—Three-core feeder cable, transformer and switchgear. Borough Electrical Engineer. April 20th. (See an advertisement on another page.)

Twelve months' supply of general stores. Borough Electrical Engineer. April 18th.

Electrical accessories. Borough Electrical Engineer. April 18th. (See an advertisement on another page.)

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Ballymena.**—Electrical installation at workhouse and hospital. Engineer, F. D. Brown, 93 Ann Street, Belfast. April 11th.

**Clayton.**—Electric lighting of workhouse. North Bierley Guardians.

**Dublin.**—Labour exchange. Office of Public Works, Dublin.

**Glasgow.**—Electric lighting at Haghill Refuse Despatch Works. Town Clerk. April 9th.

**Hastings.**—King Edward Memorial Hospital (£50,000).

**London.**—218 points at Wilson Street School, Islington. Chief Engineer. April 22nd. (See advertisement on another page.)

**Northampton.**—New post office. H.M. Office of Works, London.

**Penistone.**—Electric lighting of workhouse, Netherfield. Clerk, Union Offices, Netherfield, Penistone.

**Salford.**—Headquarters for East Lancashire Territorial Force. Secretary, National Buildings, St. Mary's Parsonage, Manchester.

### Miscellaneous

**Dublin.**—Twelve months' supply of arc-lamp carbons. City Electrical Engineer. April 17th. (See advertisement on another page.)

**Walsall.**—Electrical equipment of new sewage pumping station. Town Clerk.

**Wigan.**—Twelve months' supply of stores for Tramways Department. Tramways Manager. April 18th. (See advertisement on another page.)

## TENDERS RECEIVED AND ACCEPTED

**Aberdare.**—The following tenders have been accepted:—Transformer, H.T. and L.T. switchgear, and instruments, Johnson & Phillips, £231 12s.; cables and feeder pillar, Macintosh Cable Co., £321 15s.

**Barnes.**—A contract has been placed with R. R. Todd for distributor cable. Fifteen other firms also tendered.

**Bexley.**—The following tenders have been received:—500-kw. turbo-alternator, British Westinghouse Co., £3,675 (accepted); Siemens Bros. Dynamo Works, £3,693; Brush Electrical Engineering Co., £3,707; Fraser & Chalmers, £3,727; Willans & Robinson, £3,818; British Thomson-Houston Co., £4,008; James Howden & Co., £4,021; C. A. Parsons & Co., £4,445; Daniel Adamson & Co., £4,751; The A.E.G. Electric Co., £4,841; Belliss & Morcom, £5,064; water-tube boiler, Ross Hotchkiss & Co., £1,700; Stirling Boiler Co., £1,703 (accepted); Howden Boiler Co., £1,720; Babcock & Wilcox, £1,780; Clarke, Chapman & Co., £2,821.

**Birmingham.**—An order has been placed with the General Electric Co. for 25,000 Osram traction lamps for the Corporation Tramways.

**Bootle.**—Contracts for miscellaneous stores have been placed with the following:—Callender's Cable & Construction Co., British Insulated & Helsby Cables, British Thomson-Houston Co., and Armorduct Manufacturing Co.

**Brentwood.**—The contract for the electric lighting of Harold Court Asylum has been placed with H. P. Girling.

**Carlisle.**—The following tenders have been accepted:—One 1,250-kw. turbo-alternator and condensing plant, Maschinenfabrik Oerlikon, £4,908; rotary-converters, British Westinghouse Co., £2,855; high-tension switchgear and feeder panel, British Westinghouse Co., £975.

**Ilford.**—The following tenders have been accepted:—Cables, C. Macintosh & Co.; carbons, Sloan Electrical Co. and Union Electric Co.; house service fuse boxes, W. Lucy & Co. and Reason Manufacturing Co.; incandescent lamps, Cryselco, Ltd., Electrical Mfg. & Supplies Co., and Pope's Electric Lamp Co.; joint boxes, W. Lucy & Co.; main switches, Edison & Swan Electric Light Co.; meters, Ferranti, Ltd., Siemens Bros. Dynamo Works, and Reason Manufacturing Co.

**Nuneaton.**—The tender of the British Thomson-Houston Co. has been accepted for a 750-kw turbo-generator at £3,300. The contract for condensing plant has been placed with Willans & Robinson at £810.

**G.E.C. Works Dinner.**—The Witton Works of the General Electric Co., Ltd., held their twelfth annual dinner at the Old Royal Hotel, Birmingham, on March 20th. Dr. Railing was in the chair, and the attendance numbered over 250. The Works Manager—Mr. W. H. Heaton—proposed the toast of the Company, and Dr. Railing, in responding, emphasised the necessity for co-operation amongst the workmen and staff. Not only for his own sake should a man apply himself to turning out apparatus of the highest possible grade of workmanship, but it was only by producing the highest class of apparatus that they were able to compete successfully with large foreign companies. He announced that the Directors had just voted a sum of £10,000 for the erection of the new club-house at Witton. Mr. Railing also replied, and said that the Board were completing arrangements for a pension scheme for G.E.C. employees. The healths of Dr. Railing and Mr. Railing were drunk to musical honours, and an entertainment followed, contributed mainly by the Witton staff.

AUTOMATIC BATTERY OUT IN & OUT OUTS  
CIRCUIT BREAKERS.**

**THE RECORD ELECTRICAL Co., Ltd.**  
OAXTON HOUSE, LONDON, S.W.

Telephone: 6700 Victoria.

## LOCAL NOTES

**Atherton: Electric Supply.**—The sub-station of the Council, which is supplied by the Lancashire Electric Power Co., was formally opened last week.

**Blackrock: Electric Lighting.**—After practically arranging with the Alliance & Dublin Consumers' Gas Co. for an electric lighting scheme for this district, the Council has now determined to carry out the undertaking itself.

**Brixham: Nuisance from Electricity Works.**—Last December an injunction was granted against the Brixham Gas Co. for nuisance by noise and vibration from the Company's electric lighting plant. The injunction was suspended until March 17th, but before Mr. Justice Astbury last week it was asked that the injunction be continued another three months to enable the Company to make the necessary alterations. In the meantime the plaintiff in the action is to be paid a small sum in way of compensation for two cottages which he is unable to let owing to the nuisance.

**Dudley: Electric Supply.**—In connection with the recent purchase of the Corporation's electricity undertaking, the Shropshire, Worcestershire, and Staffordshire Electric Power Co. has introduced a late Bill authorising it to raise new preference shares. The money is required to repay borrowings to complete the purchase of the Dudley undertaking, and also to meet the large outlay, estimated at £118,000, necessary on new plant and extensions of cables.

**Foot's Cray: Electric Supply.**—The Foot's Cray Electricity Supply Co. has applied to the Woolwich Borough Council for a supply of electricity in bulk, and terms have been quoted, after investigation by the Woolwich Council's Consulting Engineer, Mr. J. F. C. Snell. Should the arrangement be carried out a capital expenditure of £4,290 will be involved by the Woolwich Council.

**Greeland: Public Lighting.**—A meeting of ratepayers has sanctioned a scheme for street electric lighting proposed by the Yorkshire Electric Power Co. The Company offered to provide the necessary fittings, maintenance, renewals, &c., for forty street lamps at 40s. per lamp per annum, the plant and equipment remaining the property of the Company.

**Hove: Electricity Undertaking.**—A number of proposals for working the electricity undertaking recently acquired by the Corporation from the Hove Electric Lighting Co. have been received, and they have been referred to the Corporation's consulting engineer for report.

**Manchester: Trading Profits and Rates.**—The Finance Committee is to ask the Corporation to agree for another year to continue the existing basis of contributions from profits of the Corporation's trading undertakings in aid of the rates, which include 1 per cent. on the capital expenditure of the electricity undertaking, and 5 per cent. in the case of the tramways undertaking.

MISCELLANEOUS BUSINESS NOTES AND  
TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £66 15s. to £67 5s. (Last week, the same.)

**Change of Address.**—The office address of J. E. & S. Spencer, Tube Merchant (14 Great St. Thomas Apostle, Cannon Street), has been changed to 16 Dowgate Hill, E.C., and the warehouse is now at 33 Dowgate Hill.

**Royal Warrant.**—Escaré & Denelle, Ltd. (129 Wardour Street, W.), have recently been honoured with the Royal Warrant of Appointment as Manufacturers of Electrical Fittings and Bronzes to his Majesty King George V.

## APPOINTMENTS AND PERSONAL NOTES

We announced in our last issue that Mr. H. Richardson, City Electrical Engineer at Dundee, had been appointed Electrical Engineer to the Salford Corporation, at a salary of £1,000 per annum. Although Mr. Richardson wrote accepting the appointment, he subsequently decided, under pressure by the Dundee Electricity Committee, to remain at Dundee. After a discussion in the Council Mr. Richardson has been offered an immediate increase from £650 to £800 per annum, with £50 annual increments until a maximum of £1,000 per annum is reached. Mr. J. A. Robertson, Burgh Electrical Engineer at Greenock, has now been appointed to the Salford post. The original advertisement brought some sixty applications, and the first short list consisted of ten, from whom Mr. Richardson was finally selected. Since Mr. Richardson's withdrawal, the Committee took the nine remaining candidates and added four others, subsequently reducing this number to eight, from which four were selected to appear before the Committee. One, however, withdrew his application, so that only three presented themselves, and from these Mr. Robertson was selected.

The Leeds City Council has decided to appoint a General Purposes Committee to deal with all questions of wages, hours, dismissal, and control of municipal employees, and has appointed Mr. J. B. Hamilton, the Tramways Manager, as executive officer of the Committee, with an increase of £500 in his salary. This Committee is the outcome of the recent strike, the object being to deal with employees in such a manner as to prevent a recurrence.

Mr. George Broadhurst, Assistant Electrical Engineer in the Worthing Electricity Department, has been appointed Clerk of the Works in connection with the erection of the Basingstoke Council's electricity works. The arrangement is that if Mr. Broadhurst's services are satisfactory he will be appointed Resident Engineer at a salary of £170 rising to £200 on the inauguration of the undertaking.

COMPANIES' DIVIDENDS, REPORTS,  
MEETINGS, &c.

**British Westinghouse Co.**—Continued improvement in the business of this company is notified in the report for 1913. The gross profit amounted to £223,103, and after setting aside £44,100 for depreciation on works and plant, placing £6,728 to redemption of 6 per cent. prior lien debenture stock, there is a net profit of £106,493. The sum of £50,000 is placed to general reserve, the 5 per cent. preference dividend absorbs another £50,000, leaving £6,493 to be carried forward. The capital reduction scheme has been sanctioned by the Court, and under this the balance of £66,899 standing to the credit of profit and loss account in December, 1912, has been absorbed. Mr. P. A. Lange has been appointed managing director.

**Clyde Valley Electrical Power Co.**—The accounts for last year show a net profit of £27,678, and, after applying £3,000 for special reserve, and writing off interest paid to shareholders during construction amounting to £15,155, a sum of £9,477 is carried forward. The revenue from sale of current during the year was £8,000 more than in the previous 12 months, but this has been largely counteracted by the increased cost of coal, labour, rates, and taxes.

**County of London Electric Supply Co.**—An issue of 10,000 six per cent. cumulative preference £10 shares are being offered to the existing shareholders at £11 each. An issue of 6,000 £10 ordinary shares are also being offered at £11 10s. each.

**South London Electric Supply Corporation.**—It is stated that arrangements have been completed for the issue of £50,000 six per cent. cumulative preference stock.

**Vickers.**—In order to meet the growing requirements of the business, a further issue of ordinary shares is to be made.

**Electrical Fatality.**—An inquest was held recently on the death of an electrician named A. Thomas, at the East Pool Mine, Cornwall. The deceased was at work putting up a distribution board in the distribution room at the mine, to which he was to attach certain "dead" wires. He appears, however, to have touched a "live" wire overhead accidentally, and received a fatal shock. It was suggested that having finished his work on the dead board, he proceeded to other work, involving "live" wires, without putting on his rubber gloves. A verdict of accidental death was returned.

## SUMMARY

THE partial strike of wiremen in London continues, but the number of men on strike is not great, and several have gone back to work. (Page 202.)

THE Electric Vehicle Committee has made recommendations to supply authorities regarding tariffs for charging electrical vehicle batteries. They also recommend that the frames of cars being charged be earthed through the charging plug. (Page 202.)

EXPERIMENTS are being made in Parliament Square and Park Lane with a new pattern of enclosed flame arc lamp. (Page 203.)

A PAPER by Mr. W. C. Clinton recently read before the Illuminating Engineering Society discusses the accuracy with which the illumination produced by a lighting installation can be predetermined. (Page 203.)

THE construction of a wireless telegraph calling apparatus is dealt with in our questions and answers columns. (Page 204.)

SEVERAL patterns of voltage regulator for alternating current feeders are described in an illustrated article. (Page 205.)

AT last Thursday's meeting of the Institution of Electrical Engineers, some problems in connection with the arrangement of automatic signals to obtain the greatest possible frequency of train service were discussed in a paper by Mr. H. G. Brown. The year's working of the L.C.C. Tramways has resulted in a deficit of £91,705. (Page 205.)

LAST week the Patent Office published Specifications relating to the sintering of tungsten for incandescent

lamp filaments, by R. B. Walling, of the American General Electric Company; wireless telephony, by W. T. Ditcham and Grindell-Matthews Wireless Telephone Syndicate; and railway signalling by means of incandescent lamps, by Siemens Bros. & Co. (Page 206.)

SOME results of an investigation into the behaviour of high-frequency ammeters are referred to under "Telephony and Telegraphy." (Page 207.)

A NEW cinematograph, in which the film can be stopped at any time, and a new pattern of electric sign are described in our Trade Section, which also refers to a remarkable example of the perfection to which insulation of electrical machinery can be brought. (Page 208.)

A 1,000-kw. battery with booster and switchgear is required at Belfast; a 300-kw. generating set at Tunbridge Wells; cables, meters, &c., are required at Glasgow; mains at West Bromwich; and a new sub-station at Worcester.—Extensions to plant are also contemplated at Middleton (£6,000); Hove (£20,000); and Torquay. (Page 209.)

THE Deal & Walmer Gas Co. has been granted electric lighting powers with an option to the local authorities in question to take them over within twelve months.—The Kidderminster & Stourport Electric Tramway Co. is to pay £100 damages to a local firm for cutting a private electric supply cable.—The South Suburban Gas Co. has, under pressure, withdrawn the electrical clauses from its gas bill.—The Leeds £200,000 extension scheme has been sanctioned by the Corporation. (Page 210.)

THE General Electric Co. is issuing new capital. The issue of new capital by the County of London Electric Supply Co. has been largely oversubscribed.—The Brush Electrical Engineering Co. made a net profit of £20,000 last year. (Page 210.)

**London Electricity Supply.**—Mr. C. H. Merz's report to the L.C.C. which (1) deals with the existing means for the supply of electricity in London; (2) gives an outline of a complete ultimate scheme for Greater London, and indicates what modifications would be required in any such scheme, if it were limited to the County of London; (3) includes a definite recommendation as to the initial steps to be taken in the direction of a complete scheme, bearing in mind the existing conditions and the general financial position, will shortly be on sale. The second reading of the London Electric Supply Bill has again been deferred, this time until Monday, April 20th.

**Golf by Electric Light.**—Last Saturday night a golf match was played at Bushey Hall by electric light with considerable success. The light was provided by four powerful C.A.V. motor-car head-lamps with parabolic reflectors carried by caddies, and each supplied from a battery carried by another caddie. Two of the lamps were used to illuminate the ball and the ground around the player, while the other two were directed down the course, and enabled the flight of the ball to be followed for fully 150 yards. Good scores were made, and there was only one lost ball in the match.

## THE WIREMEN'S STRIKE

THE strike of electrical wiremen in London is causing very little inconvenience, for, as mentioned in our last issue, the amount of wiring work in progress in London at the time was very limited, and only a small proportion of the men at work have come out on strike. By the Union's own admission the number of strikers has diminished. In some cases the masters are paying the men 10½d. an hour now, which is ½d. above the minimum they had already conceded before the strike was declared, and is the minimum already promised from next July onwards. The Union have evidently withdrawn their demand for 11d., and are now apparently going round to the firms who have men on strike, offering to order the men back if the firm will sign the following:—

"We agree to pay electrical wiremen and electrical fitters on and after the first pay day in April, 1914, a minimum rate of 10½d. per hour, and any further advances of wages which may be secured, to work to the 1912 working rules card of the Electrical Trades Union pending a settlement with the London Electrical Masters' Association, to recognise the erection of all electrical conduits as the work of electricians, and will not insist on the inclusion of a disability clause in any new working rules which may be formulated."

Although the London District Secretary of the Electrical Trades Union has informed us that several leading firms have signed this letter, we have not been able to find a single firm of any considerable magnitude which has done so. In order that we might check the accuracy of the statement issued by the Secretary to the Press that 40 or more firms had accepted the men's terms, we asked him last Saturday for a list of these. A list was given us, after considerable pressure on our part, just as we were going to press yesterday, and we selected three of the largest on it (Messrs. Stegmann, Hampton's, and Waring & Gillow), and telephoned to them. All three deny that they have signed the above letter, or any agreement debarring them from employing both Union and non-Union men.

Probably the total number of electrical wiremen in London who were working previous to the declaration of the strike and who are now "out," does not exceed 150, and some of the largest firms are quite unaffected. The Electrical Trades Union have, in fact, done their members no good, and the only result of the strike is the inconveniencing of half-a-dozen firms by delaying the work on some jobs. Some of the men have suffered grave injustice at the hands of the Union. There are cases in which men earning 11d. and even 1s. an hour have given way to pressure and have struck work, while other Union men are working at 10½d. with the sanction of the Union, and working side by side with non-Union men.

Statements have appeared in the daily Press as to the Newspaper Proprietors' Association having granted all the demands of the Electrical Trades Union with regard to electricians employed in newspaper offices. These statements, however, are inaccurate, and we are officially informed that the following are the facts:—The Council of the Association has recommended its members forthwith to increase the minimum rate from 9½d. to 11d., and other rates above this by 1d. per hour. Night-work is to be paid for at the rate of time and a third, but any man at present receiving time and a half is to continue to do so. The number of hours per week for day-work has been agreed at 50, and for night-work at 48. The other matters referred to in these newspaper statements have not yet been considered by the Association.

On Monday the London News Agency circulated a statement to the effect that on Saturday a member of the Electrical Trades Union employed by the Marylebone Borough Council was sent on a job which the men considered "black," refused to do it, and was discharged, with the result that all the rest of the Union electricians, together with a large number of non-union men, ceased work on Monday. On inquiring at the Electricity Department of the Marylebone Borough Council on Tuesday, we were informed that there is no trouble or disaffection among the workmen, and that all the men are at work.

## ELECTRIC VEHICLES

AT the last meeting of the Electric Vehicle Committee on March 20th it was decided to recommend to supply authorities and companies that for "off-peak" charging the maximum price for the supply of electric energy for charging the batteries of electric vehicles should not exceed 1d. per unit at the declared system and pressure. The Committee do not consider it desirable to make any recommendations as to a special peak tariff, but suggest that special encouragement be given for charging vehicle batteries between 11 p.m. and 6 a.m. by offering a lower rate, and they consider that the supply might be remuneratively given between these hours at a price of ¾d. per unit. The Committee recommend that a scale of discounts be arranged to meet the case of large consumers, and they further recommend the giving of an additional discount of 20 per cent. off for energy purchased by a consumer for re-sale, and metered on the latter's own premises. It was also recommended that a minimum charge not exceeding 2s. be made for current supplied for any one charging operation. The Secretary was directed to send a letter to supply authorities and companies embodying these recommendations. As to the standard charging plug, in connection with which the Committee have recommended to the Engineering Standards Committee that the American standard 150-ampere plug be adopted as the standard for this country (as far as the diameter of contacts is concerned), the Committee have reconsidered the matter of earthing, and, in view of the fact that under certain conditions the charging of the battery might be done direct off a high-pressure supply service through a resistance, they thought it was desirable to earth the framework of the chassis through the plug and receptacle by means of a third earthing conductor embodied in the main flexible charging cable. The Committee recommend that arrangements be made for this earthing in all cases. The Technical Subcommittee are busy dealing with details appertaining to the plug, such as terminals, areas of contact, &c. They are also considering the question of size of battery cells and battery trays, charging voltages, &c.

**The Siemens' Smoking Concert.**—The King's Hall of the Holborn Restaurant was crowded to its utmost capacity on Monday evening last, on the occasion of the reunion of the staffs of Siemens Brothers Dynamo Works and Siemens Brothers & Co. and many of their friends, at their annual smoking concert. Mr. Alexander Siemens was in the chair, supported by Mr. C. Koettgen and other directors and officials of the Siemens firms, and at about 50 tables scattered over the large hall members of the staffs dispensed hospitality to the large number of guests who had been invited. We saw many familiar faces of those now or formerly serving under the Siemens flag, and it was a pleasant opportunity to renew old acquaintances, and to make new ones in the ever-widening circle of Siemens Society. Among the visitors one also recognised many well-known men in the electrical industry and profession. An excellent programme of music and humorous entertainment was provided, and the enthusiastic way in which the artists' efforts were received showed that they were well appreciated. The committee are to be congratulated on the success attending their labours, which enabled such a pleasant evening to be spent. The brilliance of the scene was much enhanced by the improved lighting of the hall, which was principally by half-watt lamps in large holophane bowls suspended from the roof.

**The Institution of Electrical Engineers.**—The following is the result of the Ballot for the election of New Members and for Transfer from one Class to another at the Meeting last Thursday:—*Candidates Elected as Members:* R. de Valbreuze, P. D. Michod, A. E. Powell, D. B. Rushmore. *As Associate Members:* F. F. P. Bisacre, E. J. Hamlin, L. Schüller. *As Associates:* W. L. Jenkins. *As Graduates:* G. V. R. Fraser, W. F. Marchinton, G. H. Murphy, A. J. Ramsay, J. H. D. Sheppard, W. G. Stokes. *As Students:* G. McDonald Buchanan, F. W. Eagle, H. S. Housden, E. W. A. Jammouille, V. R. Krohn, J. F. Lee, C. G. Lovegrove, D. R. McWhinnie, D. Mathieson, H. T. Moody, R. B. Paul, F. H. Pernet, H. P. Rhodes, T. McArdle Ryan, E. J. Shuter, E. Slevin, C. B. Thompson, R. Young, Jun. *Candidates Transferred:*—*From Associate Member to Member:* W. Houlst. *From Associate to Member:* H. J. Gridley. *From Student to Associate Member:* J. L. Moffet. *From Student to Graduate:* E. J. Chawner, H. Cross, L. D. Francois, C. E. Glasspool, B. D. Jain, W. I. Monkhouse.

**Crystal Palace School of Engineering.**—The 124th Award of Certificates was held at the school yesterday. Mr. Cyril S. Cobb (chairman of the London County Council) was in the chair.

## STREET LIGHTING IN WESTMINSTER

EXPERIMENTS in street lighting with a new pattern of arc lamp are being made by the Westminster Electric Supply Corporation. The lamp in question, which is of a type supplied by Siemens Bros. Dynamo Works, Ltd., is of the vertical-carbon, non-magazine, double-enclosed-flame type, and has several points of interest. Two of these lamps are installed in Parliament Square, and some are also being tested in Park Lane. The Parliament Square installation is of particular interest in view of the fact that the whole

FIG. 1.—POLAR CURVE OF LIGHT DISTRIBUTION.

lighting of that area is about to be reorganised, and the decision as to whether high-pressure gas or electric light is adopted will be largely influenced by the results with these experimental lamps. About forty would be required to light the whole space to replace the existing eighty-five gas lamps, but a vastly improved illumination would result. The lamps are carried on standards 27 ft. above the ground.

The lamps are of the 10-ampere size, and their particularly favourable light distribution is shown in Fig. 1, from which

FIG. 2.—SECTION OF LAMP.

it is seen that the maximum candle-power is given about 30° below the horizontal. The pressure across the arc is about 44 volts, and the arc itself is about 1½ in. in length. The colour of the light is pleasing and unvarying, and is a great improvement on the deep yellow characterising some of the earlier enclosed flame lamps. The light is also very steady, and these facts are largely accounted for by the very homogeneous nature of the carbons employed. These are not cored in any way, but have the appropriate chemicals

evenly distributed throughout the carbon. About 100 hours' lighting can be obtained with a single pair of carbons. A cross-section of the lamp is shown in Fig. 2. The feeding mechanism is of the differential pattern, but the main point of interest is in the arrangements adopted for ventilating the lamp so that the fumes from the arc do not cause a deposit on the globe in a position to interfere with the illumination. It will be noticed that above the arc there are three parallel casings, the inner casing containing the mechanism, a removable intermediate casing, and the outer casing. The heated gases from the arc pass between the intermediate and the inner casing, and leave almost all deposit on the inner surface of the intermediate casing, returning to the inner globe between the intermediate and outer casing. The small remaining quantity of deposit collects on the lower part of the inner globe, but the upper part, through which the maximum part of the light comes, remains perfectly clear. The deposit is of a non-corrosive character, and is easily cleaned off from the removable casing and the inner globe. The function of the outer globe is to keep the inner globe from becoming cool, and to protect it from the weather.

In conclusion, we wish to express our thanks to the Engineers of the Westminster Electric Supply Corporation, Ltd., for giving us particulars of these lamps.

## THE PREDETERMINATION OF ILLUMINATION

A PAPER was read on March 17th by Mr. W. C. Clinton, before the Illuminating Engineering Society, entitled, "A Comparison of Estimated and Observed Values of Illumination in Some Lighting Installations." A large number of actual cases are considered, and comparisons are made between the calculated horizontal illumination on the working plane and its value observed by photometry. The point-by-point method of calculation from known polar distribution curves for each source of light gives in general lower values of the horizontal illumination than those observed, the difference diminishing as the effect of walls and ceiling are made less and less either by their colouring or their distance from the lights. Calculations of the flux of light method should give the same mean horizontal illumination as the point-by-point method, although giving no information as to the distribution of the illumination. A third procedure is to calculate from the polar curve the total flux of light liberated in the room, and then to compare the mean horizontal illumination that would be produced if the whole of this flux arrived on the plane of reference with that actually measured, and thus to arrive at a ratio which may be termed the utilisation factor of the installation. A number of cases are gone into in great detail in the Paper, and values of the utilisation factor, varying from 30 to 65 per cent., are obtained, according to circumstances, and the general inference is drawn that the illumination produced in a given room by a given arrangement of lamps can be predicted with greater accuracy than has generally been supposed.

**Congress of Consulting Engineers.**—The second International Congress of Consulting Engineers, promoted by the Fédération Internationale des Ingénieurs-conseils et Ingénieurs-experts, will be held at Berne from July 15th to 22nd this year on the occasion of the Swiss National Exhibition. The last congress of this nature, when the Federation was founded, was at Ghent last year. There are no British representatives on the Committee. Applications for membership must be made to Mr. Herbais de Thun, Secretary of the Congress, 18 rue Marie-Thérèse, Brussels, Belgium. Among the subjects to be considered are general professional rules, propaganda, tariffs of professional fees, conditions of contracts, referee services and arbitrations, and the inclusion of consulting engineers on the juries of exhibitions. Excursions of technical interest will be arranged during the exhibition. It is proposed to hold the next Congress at San Francisco in September, 1915.

**University College.**—The annual report of the work of University College (Gower Street, W.C.) has just been issued. We note that the total number of students during the session 1912-1913 was 2,083. Of these, 128 took courses in engineering. In addition, there were 196 students of other colleges attending the various inter-collegiate courses. The number of graduates was 144, of whom 113 took honours, and 10 gained University scholarships. The scheme of advanced and post-graduate courses in the faculty of engineering has been continued, and those by Professor Fleming on "Telephone and Telegraph Cables and the Transmission of Small Alternating-Current Power" and "Conductors for the Electrical Transmission of Energy," attracted a large number of engineers in practice. Other subjects dealt with included "Steam and Gas Turbines," "Influence Lines and their Application to Structural Design," "Electrical Design," &c.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,386.

With an electric crane brake of Laurence Scott's flapper type, trouble is experienced by wearing of the wooden blocks owing to the load being too light to attract the flapper. The motor is rated at 22 b.h.p. at 600 r.p.m. The crane is designed for 20 tons, but is used for an average load of about three tons. Can any remedy be given for the trouble, which cannot be got rid of by adjustment of the springs.—**POTENTIOMETER.**

(Replies must be received not later than first post, Thursday, April 16th.)

### ANSWERS TO No. 1,384.

A small wireless installation has been erected, which is working to a receiving station about a quarter of a mile distant; the signals can be heard with the receiver about two inches away from the ear. It is desired to fit up some sort of calling arrangement to enable the receiving station to be called up. This could take the form of a coherer, but, as this cannot be tuned to a given wave, a relay of some description is preferable so that it can take the place of the telephone when not receiving. Please suggest a suitable form of apparatus.—**"CALL."**

The first award (10s.) is given to "ASTATIC" for the following reply:—

An excellent calling arrangement may be constructed at a very small cost in the form of a very sensitive relay and a "home-made" coherer. For a small receiving station

it is practically impossible to better a small coherer of the type indicated in Fig. 3. Figs. 1 and 2 show the circuits and design of a sensitive polarised relay. M is a permanent horseshoe magnet showing N and S poles. EM is an electro-magnet, which is free to move on a pivot, the pivot being just below the half-way point. It will be noticed that the upper portion of the electro-magnet is slightly in the power of the S pole. A pair of contacts, K, are connected to a battery and a single-stroke bell. C is a coherer, D the decoherer. A and E are the aerial and earth wires respectively.

The action is as follows:—A wave is received on the aerial wire which coheres the filings in the coherer. This allows a small current to pass through EM, which makes

the polarity of the upper portion of the electro-magnet a S pole. EM is consequently repelled by S and attracted by N, thus making contact on K, this allowing a current to pass from the battery through the bell, which gives a stroke. This series of operations is continued the whole time that waves are received on the aerial wire, the result being a continuous ringing of the bell. In small installations accuracy in tuning is not necessary, this difficulty being overcome by the coherer shown in Fig. 3. T is a glass tube  $\frac{1}{8}$  in. internal diameter. F are nickel filings which have been silver-plated. N are nickel terminal bars which run through pieces of cork, C, to two small plates, which make contact with the filings when the coherer is cohered. Before using this coherer the two blocks, N, should be pressed together to exclude as much air as possible. They should then be slowly opened to the desired width, according to the atmospheric conditions for receiving. The space containing the filings will then be practically a vacuum. The coherer is then ready for use, and it has been found from extensive experience that it can be adjusted so that the bell will give one ring for a "dot" and two rings for a "dash," that is, of course, if the person transmitting can be relied upon to transmit with the same regularity.

The second award (5s.) is made to "MARP," who writes as follows:—

The object desired may be attained by using an apparatus similar to that shown in Fig. 4. It has been assumed that the receiver at present in use is not of the coherer type, and therefore no decohering arrangement is shown. The two coils, BB, although not absolutely necessary, are

FIG. 4.

- |                       |                                   |
|-----------------------|-----------------------------------|
| A. Detector.          | F. Battery for Bell or Telephone. |
| B. Choking Coils.     | G. Two-way switch.                |
| C. Battery for Relay. | H. Bell.                          |
| D. Relay.             | J. Telephone Receiver.            |
| E. Contact.           |                                   |

highly desirable. They should consist of, say, 120 turns of No. 24 covered wire, wound on a bobbin without a core. Their object is to choke back the oscillatory currents received from the aerials and confine their effect to the detector. The resistance will not be enough to prevent the satisfactory operation of the relay, providing the latter is reasonably sensitive. The apparatus is shown ready to receive a call. When it is desired to use the telephone receiver, the switch, G, must be moved to the left. This puts the call-bell out of circuit. It is advisable to use some form of hook-switch, so that when the telephone receiver is taken off its hook the above operation takes place automatically.

A reply received from "CONDUCTOR" suggests that the relay in the coherer circuit should be fitted with some form of air-brake or dash-pot, so as not to respond to atmospherics or strays, but only to a series of long dashes. He also suggests the use of Brown, Heurtly, or Orling relays with an ordinary oscillation transformer.

**Shipping, Engineering and Machinery Exhibition.**—A considerable proportion of the space at this exhibition, which is to be held at Olympia from September 25th to October 17th next, has already been allotted, and the following will be among the exhibitors:—Adnill Electric Co., Babcock & Wilcox, British Vacuum Cleaner Co., Sherard Cowper Coles, Edison Accumulators, Electric Appliances, Ltd., Feld Bros. & Co., India Rubber, Gutta Percha & Telegraph Works Co., Kelvin, Bottomley and Baird, Marconi's Wireless Telegraph Co., W. McGeoch, Medway Safety Lift Co., Metal Jointing Co., Miralite, Ozonair, Pinchin, Johnson & Co., Worsnop & Co. The Dutch Section will be a special feature of the exhibition.

## FEEDER VOLTAGE REGULATORS

IN modern alternating supply schemes with large generating units there is a growing need for the separate regulation of the voltages of feeders, and several types of regulator which have recently been introduced by the British Thomson-Houston Co., Ltd. (Rugby), are of interest in this connection. These consist in principle of variable ratio transformers with two separate windings connected respectively across and in series with the feeder to be controlled. In one class of regulator the two windings are arranged on separate circular concentric cores, one of which can be partially rotated within the former. The series or secondary winding is arranged in slots on the inside circumference of the stationary core, and the shunt or primary winding in similar slots on the outside circumference of the movable core, and the variation in the feeder voltage produced by the regulator is entirely due to the change in the angular positions of these cores.

The windings on both stationary and movable cores are in effect polar windings. With a given pole of the primary opposite a similar pole of the secondary, the regulator will

like an ordinary transformer, with the primary winding connected across the line and the secondary in series as before, but with a number of tapings brought up to a multiple-point switch, either hand-operated or controlled automatically. Such an automatically-controlled regulator is shown removed from its tank in Fig. 2. In the hand-operated pattern the dial switch is interlocked with a reversing switch, so that the boost can be given in either direction, and a mechanical device gives quick transit from one step

FIG. 1.—SINGLE-PHASE AUTOMATICALLY-CONTROLLED FEEDER VOLTAGE REGULATOR.

boost the line voltage, but will lower it if opposite a dissimilar pole; and the change from "boost" to "lower" is gradual, as a given primary pole is rotated through the angle between a similar and a dissimilar pole of the secondary.

In the single-phase regulator there is a single stationary series winding, but the armature carries a short-circuited winding as well as, and at right-angles to, the shunt winding, which decreases the reactance of the regulator. An exterior view and section of a single-phase regulator is shown in Fig. 1. In the polyphase regulators the excitation is produced by the combined action of shunt windings across the separate phases, and the field is a rotating one, and the variations in line-voltage produced are due to phase displacement. The impedance with the symmetrical winding employed is small and no auxiliary short-circuited coil is necessary. The full-load efficiency varies from 93.5 to 96.5 per cent. in the single-phase regulator, and from 92.5 to 9.65 in the polyphase machines. The cores carrying the windings are usually contained in tanks, with the operating gear on the top. The shifting of the angular position of the movable core can be done by hand through suitable gearing, or by a small electromotor controlled by hand or automatically. Limit switches are provided to open the motor circuit in the extreme position, and a brake to stop the motor quickly as soon as the desired position has been reached. The automatic control is by means of a relay switch actuated by a contact-making voltmeter, and when a compounding effect is desired to compensate for feeder drop, a compensating winding fed by current transformers can be added to the relay switch.

Another type of single-phase regulator has fixed windings

FIG. 2.—SWITCH TYPE REGULATOR.

FIG. 3.—SMALL AUTOMATIC INDUCTION REGULATOR.

to another, but in the automatic controllers a second secondary winding renders a reversing switch unnecessary, and an arrangement of multiple-contact fingers and preventive resistances is provided, so that the switch can stop in any position. With this pattern of regulator the efficiency is from 95 to 97 per cent. for hand-operated, and a little less for those automatically controlled. Another type of automatically-controlled regulator for small feeders is shown in Fig. 3. This has a movable core with few slots and considerable angular movement, and is controlled by a step-by-step gear driven by a constantly-running motor through clutches, and controlled by a voltage relay. This style of regulator is made in sizes up to 2.2 k.v.a., and has an efficiency of about 90 per cent. A hand-worked regulator of similar construction is also made.

## ELECTRIC TRACTION NOTES

At last Thursday's meeting of the Institution of Electrical Engineers, Mr. H. G. Brown read a Paper entitled "The Signalling of a Rapid Transit Railway, a Study in the Relation between Signal Locations and Headway." His remarks were devoted entirely to track circuit automatic signalling, which, he said, with a frequent service was cheaper per unit section, as well as permitting of closer headway, than any manual system. He explained the general arrangement of signals and overlap for straight-away working, and discussed the influence of the time of station stops on headway, by ingenious diagrams. He showed how, if trains are run right up to the theoretical limiting headway, any delay of a train above the scheduled station-stop caused greater and cumulative delay due to the effects of acceleration and deceleration. There were, however, two ways by which the effect of station delays could be lessened; one was by additional home signals obtained by sub-dividing the station section, and letting the sections, still of standard length, overlap each other. The effect of different numbers of these was investigated, and a graphic construction was given for determination of the correct points of sub-division. Another method was the "speed control" system, in which a train was allowed to approach nearer than the standard distance behind a standing train, but its previous deceleration was ensured by a series of signals with time-limit appliances arranged to clear a predetermined number of seconds after the entrance of the train into its approach section. Although this system has given satisfaction where it has been tried, Mr. Brown had objections to it as not

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published April 2nd, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

5,734/13. **Multiple Recorders.** B.T.-H. Co. (*A.E.G.*). Different markings are produced by the use of a paper soaked in an electrolyte and different electrodes, or by different current strengths. One or both sides of the record sheet may be used. It is mentioned that suitable electrolytes are potassium ferrocyanide or iodide, *e.g.*, paper soaked in the first will give a red, blue, or green line with a positive electrode of copper, iron, or steel. Eight figures.

5,926/13. **Three-wire Generator.** F. NEWTON and NEWTON BROS. The machine acts as an auto-transformer, balancer, booster, or three-wire generator. The armature winding span is  $1/3n$  of the periphery, where  $n$  is the number of pairs of poles, also spaced a distance  $1/3n$  apart, in combination with  $3n$  brushes symmetrically spaced. Interpoles are provided. The main poles are compound wound. Four figures.

6,136/13. **Nitrogen Fixation Furnaces.** E. KILBURN SCOTT. A conductor between the electrodes is connected through a condenser to a high-pressure high-frequency supply, so that as the arc is periodically interrupted it is started at once by the discharge breaking down the air between the electrodes. Three figures.

6,369/13. **Telephony.** D. H. KENNEDY and J. W. TURNER. The cord circuits are automatically disconnected by relays controlled by the subscribers' hook switches, so that the lines are cleared, in advance of the withdrawal of the plugs by the operator, as soon as both subscribers have replaced their receivers. About fourteen figures.

12,076/13 and 12,157/13. **Wireless Telephony.** W. T. DITCHAM and GRINDELL-MATTHEWS WIRELESS TELEPHONE SYNDICATE. The first specification describes how microphones may be mounted that, on becoming unduly heated, those in use can be cut out of circuit and others cut in, *e.g.*, they may be mounted on a rotary plate with metal segments. The second specification describes a switching arrangement whereby, on moving a single switch, a circuit is made through a relay which disconnects the aerial from the primary receiving inductance, and connects it in the transmitting circuit. On further movement of the control switch the circuit is energised through another relay. The specifications have three and one figure respectively.

14,795/13. **Sintering Tungsten for Lamp Filaments, &c.** R. B. WALLING (American General Electric Co.). The broad claim is for sintering metal rods by mounting them without lateral confinement, so that the sintering current can be passed throughout their entire length, whereby the whole rod can be raised to a sintering temperature in an inert atmosphere. The cooled contacts at the ends of the rod are arranged so that they automatically approach and exert sufficient pressure on the rod as it contracts. One of the contacts is floated in mercury for this purpose.

17,713/13. **Railway Signalling.** SIEMENS BROS. (*Siemens & Halske A.-G.*). Red and green incandescent lamps are arranged so that when the green lamp is luminous it is in parallel with the red lamp, which is of such a pressure that, with a resistance in circuit, it is not luminous while the other circuit is complete. One figure.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** DOULTON and MORRIS [Insulators] 6,421/13 and 5,501/14; MIRZA [Cables] 6,817/13; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Distributing systems] 13,656/13; SIEMENS-SCHUCKERTWERKE [Rotary presses and paper-calendering machines] 24,017/13.

**Dynamos, Motors, and Transformers:** BRITISH ELEC. TRANSFORMER Co. and CROSBIE-HILL [Transformer arrangements] 6,799/13; CHRISTIE (*Galvanische Metall-Papier Fabrik A.-G.*) [Brushes] 25,465/13.

**Electrometallurgy and Electrochemistry:** SIEMENS BROS. (*Siemens & Halske A.G.*) [Electro-diathermic treatment of the body] 16,985/13; FISCHER [Process for heating articles in furnaces] 17,490/13; FRIEDR. KRUPP A.-G. [Furnace electrode holders] 5,414/14.

**Ignition:** VARLEY, 17,607/13.

**Storage Batteries:** LUCAS [Vents] 17,584/13; SVENSKA AKKUMULATOR AKTIEBOLAGET JUNGNER, 30,082/13; DE SEDNEFF, 1,119/14.

**Switchgear, Fuses and Fittings:** POLLAK [Interrupters] 6,122/13; MILLER and BOOTHMAN [Regulators] 6,371/13; MELLERSH-JACKSON (*Eyquem*) [Regulators] 7,156/13; CANTONO [Automatic starters] 7,241/13; COX [Fuses] 9,144/13; HOLMES and KEMP-WELCH [Overload circuit-breakers] 13,587/13; MITCHELL and COOPER [Multiple way separators] 19,212/13; HENLEY's TELEGR. WORKS and BISHOP [Cable bonding clamp] 20,195/13.

**Telephony and Telegraphy:** MARKS (*Gen. Engng. & Constr. Co.*) [Printing telegraphs] 29,057/12; SIEMENS BROS. and GRINSTEAD [Telephone test-circuits] 7,125/13; SIEMENS & HALSKE A.-G. [Telephony] 10,685/13 and 12,651/13; MORSE [Telephone locking] 18,160/13; MARCHANT [Sound transmitters] 460/14.

**Miscellaneous:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [Steering-gear] 1,505/13; LEAVITT [Timing mechanism for torpedoes] 6,272/13; STERN (*Hubert*) [Dry batteries] 6,950/13; GLEASON [Boron copper] 8,790/13; FRIEDRICH [X-ray tubes] 9,449/13; BLACKALL and HUTT [Locking of railway points] 12,599/13; BARTLETT and BRUCE [Compasses] 13,684/13; SIMMS and ROLPH [Indicators for automobiles] 13,732/13; BARKER [Compasses] 14,083/13; GIBSON, FARMER and READ [Indicating approach of trains] 14,384/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos and Motors:** SIEMENS-SCHUCKERTWERKE [Rotors: cooling] 5,828/14.

**Instruments and Meters:** A.E.G. [Watt-hour indicating magnet motor meter] 4,356/14; SIEMENS-SCHUCKERTWERKE, 6,341/14.

**Miscellaneous:** HEINS [Substitution resistances] 10,252/13; WEINTRAUB [Vapour devices] 6,352/14 and 6,353/14; A.E.G. [Condenser with covering of metal bands] 6,418/14.

The following Amended Specifications may now be obtained:—

**Dynamos, Motors, and Transformers:** F. SPINELLI [Static three-phase to single-phase transformation] 2,471/13.

**Miscellaneous:** L. J. ARON, C. WIENER, and X.L. ELEC. Co. [Driving gear for clocks] 19,257/12.

### Appeal from Comptroller's Decision

3,162/13. **Ductile Tungsten Filaments.** WESTINGHOUSE METALLFÄDEN GLÜHLAMPENFABRIK. An appeal has been entered against the Comptroller's decision not to grant this Patent.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

6,701 of April 10th, 1900. **Lithographic Printing Plates.** O. C. STRECKER. By the electrolysis of aqueous salts between soluble electrodes insoluble salts are formed on metal plates.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** E. A. CAROLAN (*G.E. Co., U.S.A.*) [Starting rotary-converter] 27,765/02; R. F. HALL [Lighting by axle-driven dynamo and accumulators] 27,850/02; E. WITZENMANN [Armouring cables] 27,743/08.

**Dynamos, Motors, and Transformers:** B.T.-H. Co. (*A. D. Lunt, U.S.A.*) [Regulation of D.C.-A.C. rotary-converter] 23,589/00.

**Electrochemistry and Electrometallurgy:** D. HELBIG [Furnace for production of oxides of nitrogen from the air] 27,790/07.

**Heating:** O. H. FIDDES and H. A. SEIFKE [Water] 16,496/08.

**Meters:** H. LANDIS and G. K. GYR [Induction] 27,283/08.

**Storage Batteries:** A. O. TATE [A pasted bi-polar plate] 28,106/07, 28,132/07, 10,764/08, 10,767/08, 10,768/08, and 10,769/08.

**Switchgear, Fuses and Fittings:** J. D. HILLIARD [A.C. circuit-breakers with magnets normally short-circuited] 25,941/01; J. F. MARSHALL [Adapter and switch] 27,244/08.

**Telephony and Telegraphy:** J. A. FLEMING and MARCONI Co. [Military wireless sets on motor-vans] 23,163/00.

**Traction:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [Series-parallel contactor control system] 27,893/03; P. M. JUSTICE (*A. W. Kiddle and A. M. Baumann, U.S.A.*) [Petrol-electric] 27,236/08.

**Miscellaneous:** G. H. OATWAY [Testing automatic fire-alarms] 23,018/00; J. T. H. DEMPSTER [Starting mercury vapour lamps] 27,637/04; C. P. STEINMETZ [Starting mercury vapour lamps] 27,638/04; W. R. SYKES, C. J. COOKE, and W. R. SYKES [Remote control of lantern slides] 29,001/06; V. G. MIDDLETON [Indication of level of a liquid] 27,898/07.

providing fully for cases where a train entered the section at a lower speed than was intended.

The discussion was opened by Mr. Roger T. Smith (Electrical Engineer, Great Western Railway), who spoke of the possibility of stray currents interfering with direct current track circuits, and preferred the A.C. system. Mr. A. T. Blackall (Chief Signal Engineer, Metropolitan Railway) said that some of the conditions in a surface railway were different from those underground, such as the author had dealt with. In his own railway, a system of automatic signalling was under consideration for open-air work. This would have signals of very distinctive character, to be seen easily in bad weather. They would be of the upper quadrant type, with three positions or "aspects," a horizontal danger position, an upwardly-inclined position indicating only the next section clear, and a vertical section showing that two or more sections were clear. These would be controlled by A.C. track circuits, and ramps would be provided to act as automatic train stops, and also to give an audible signal in the cab. Treadles would probably be provided in addition to the track circuits for the signal control. Mr. H. W. Firth (G.E.Ry.) regretted that more had not been said as to junctions and terminals. He thought that the type of rolling stock had a good deal to do with the length of the station stops. The systems brought forward by the author appeared only possible when trains stopped at all stations, and he suggested that the addition of non-stop trains might therefore really decrease the carrying capacity of the line. Mr. Brown replied at some length, mentioning 44 trains per hour as the rush hour service on the District Railway, where in some places two additional home signals were used, and repeated his objections to the speed control system.

The proposal of the North Eastern Railway Co. to run trolley omnibuses between Gateshead and Newcastle stations is meeting with considerable opposition, both on the part of the Newcastle Corporation and the Gateshead & District Tramways Co.

The London United Tramways Co., after a hard fight before a House of Commons Committee last week, has succeeded in obtaining powers to run trailer cars. As in every proposal of this description, the London police authorities were among the opponents.

In his speech last Tuesday regarding the London County estimates for the forthcoming year, Mr. R. C. Norman, Chairman of the Finance Committee, reviewed the present financial condition of the tramway undertaking, and announced that last year's working had resulted in a deficit which would have to be met by drawing on the reserve fund to the extent of £91,705. This would leave the reserve fund at £187,851. Nothing could therefore be added to the renewals fund, which was now £548,713. The original estimates for the year had showed a balance of income and expenditure. The unsatisfactory result was attributed to motor-omnibus competition. It was hoped that the running of trailer cars, and further lowering of fares, would result in slightly better working this year, but, taking the receipts

at 9d. per car mile, only a little better than last year, there would still be an estimated deficit of £46,682, with no contribution to renewals.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A detailed report of an investigation into the behaviour of high-frequency ammeters by J. H. Dellinger, of the United States Bureau of Standards (Washington), is now available, and is known as Reprint No. 206 (from the Bulletin of the Bureau of Standards, Vol. 10). Some of the conclusions reached are that most of the errors of the commonly used high-frequency ammeters are due to mutual or self-inductances of parts which were supposed negligible. The use of high-resistance metals in the working parts, keeping them of very small cross-section, eliminates errors in most cases. In hot-strip ammeters, if the strip be kept thin enough, the observed errors depend entirely on the current distribution in the terminal blocks, and can be eliminated. An instrument free from theoretical objections consists of current elements arranged equidistantly on a cylindrical surface, and fed from the middle points of the ends of the cylinder; but in practice the fine wires or strip may vary in hardness or in cross-section, and the instrument may read correctly at high frequency, and not at a lower frequency, or *vice versa*. The only reliable instrument over the range of frequencies used in wireless telegraphy is that in which a single hot wire is used; but two wires in parallel immersed in an oil-bath are nearly as reliable, and may be used to measure currents up to 10 amperes. During the tests it was observed that the changes of current distribution in instruments whose working parts were of low-resistivity metal all occurred within the range of radiotelegraphic frequencies (100,000 to 1,500,000).

The Local Government Board has sanctioned the borrowing by the Hull Corporation of the sum of £192,423 for the purchase of the telephone system in Hull. This at last settles the position of the Hull Corporation in regard to its telephone system, which has been the subject of so much controversy for several years past.

The Greek Administration confirms that since January 15th last the international rates to Crete "via Eastern" have been the same as those to Greece.—The Prussian line between Behbahan and Ahvaz was down on the 2nd inst. between Ram and Hormuz, and was restored on the 4th.—Communication with Siam via Moulmein was interrupted via Kanburi between Myitta and Kanburi, and via Raheng between Maesort and Raheng, for a short while. Telegrams for Siam were routed via Madras-Saigon.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 209. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**SEARCHLIGHT PROJECTORS.**—An advance proof of a new pamphlet dealing with searchlight projectors has been sent us by Crompton & Co., Ltd. (Chelmsford). Projectors for general commercial as well as for military use are listed. The sizes range from 12 in. diameter to 42 in. diameter, taking currents from 25 up to 180 amperes. The Company has specialised in this branch for nearly thirty years, and has supplied projectors to the British and foreign Governments, as well as the leading steamship and commercial companies. Among their uses may be mentioned surface mining, stage and advertising, &c. Hand or automatic gear is provided as required.

**TRANSPORTERS, PULLEY-BLOCKS, &c.**—Messrs. S. H. Heywood & Co., Ltd. (Reddish, near Stockport), have issued an extremely attractive list relating to electric transporters, pulley-blocks, and runways. The illustrations are admirably executed, and clearly show the application of the various types of these devices. The illustrations of some patterns of electric pulley-blocks for hanging on the crab of a hand-crane, and small transporters for use on horizontal arm jib-cranes, are particularly interesting.

**MOTOR-CAR ACCESSORIES.**—A new price list issued by the Sterling Telephone & Electric Co., Ltd. (210-212 Tottenham Court-road, W.) deals with the lighting of automobiles by means of battery and dynamo—constant pressure being obtained by armature reaction. Included is a range of head-, tail-, and side-lights, &c., horns, sparking-plugs, pocket and dash-board ammeters and voltmeters, portable lamps, wires, &c. The Company's vibrating relay for charging accumulators is also listed.

**INSULATING COMPOUND.**—A leaflet from Werths & Co. (41 Aldersgate Street, E.C.) describes a new non-rubber compound for insulating and filling in cable ends, sleeves, accumulator boxes, &c. This compound has been tested by the Reichsanstalt up to 60,000 volts, and is impervious to acid and water, as well as being non-shrinking. It becomes as fluid as water when melted. A transparent compound for similar purposes is also made.

**FANS.**—A supplementary price-list issued by Scholey & Co., Ltd. (151 Queen Victoria Street, E.C.), embraces desk, wall, ceiling, and porthole types for both direct- and alternating-current circuits.

**CONDUIT CONTINUITY FITTINGS.**—The "Demon-grip" conduit continuity fittings are priced in a supplementary pamphlet recently issued by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.).

### AN IMPROVED CINEMATOGRAPH

LAST Friday we were afforded facilities to inspect, at the Regent Street Polytechnic, a cinematograph projector patented and manufactured by L. Kamm & Co. (27 Powell Street, Goswell Road, E.C.). By means of a clutch connecting the film and shutter mechanisms, the film can be arrested at any moment, so that the picture in the "gate" at that moment is projected on the screen as a lantern slide. Besides the addition of the clutch, novel features consist in making the shutter in the form of two or more fan blades—the machine which we saw had three—and arranging it between the lamp and the film. When the clutch is thrown out the film is stopped and one picture remains stationary in the gate, but the shutter continues to revolve, and for about half a revolution keeps the light and heat of the lamp from the film, and by the fan action directs an air-blast on the film. It will be seen that the arrangement is particularly suitable for lectures and teaching purposes. The clutch is held off by an electro-magnet which may be energised by the lecturer himself through a push-button switch. In addition, manual control by the operator is possible. As soon as the lecturer desires the film to proceed, he releases the push-button switch, and this can be arranged to ring a bell in the operator's room, so that the operator can reduce the strain on throwing in the clutch by giving the driving mechanism a few turns by hand by means of a handle provided.

### A REMARKABLE INSULATION TEST

AN example of the high pitch of perfection which has been attained in the manufacture of electrical machinery has been brought to our notice by the British Thomson-Houston Co., Ltd. (Rugby). They supplied a motor direct-coupled to a pump on a combined base plate to Messrs. A. & F. Manuelle, of Guernsey, some six months ago. On being unloaded from the ship at Guernsey, the set was deposited on the top of a stack of timber on the Quay, and during a storm the stack collapsed and the machines were precipitated into the sea to a depth at high tide of about 20 ft. It was impossible to recover the set until low water, so that it was subjected to the action of sea-water at a considerable pressure for about half a day. The motor was somewhat damaged by the fall, and in addition to a bent shaft, had one foot broken off and the end-shield at the commutator end cracked through. As the machine appeared to be electrically in good condition with the exception of the wetting, Messrs. Manuelle proceeded to repair the mechanical defects. The cracked end-shield was patched, a wrought-iron foot fitted, and the armature shaft straightened, as far as was practicable, in a lathe. The motor was then reassembled, and the set installed. No dressing of any sort was applied to the windings, and the machine was left to dry itself out in service. In spite of the fact that the shaft is still slightly sprung, the motor has been running satisfactorily ever since it was installed, and although the supply pressure is 420 volts, there is no measurable leakage of current. The British Thomson-Houston Co., Ltd., in insulating the windings of their machines, ensure that every particle of the cotton covering of the conductors is thoroughly impregnated with insulating varnish, and the high quality of the material used is also an important factor in attaining such good results.

**Osram Lamp Patents.**—The recent refusal of the Gabriel Lamp Co. to answer two out of a series of interrogatories put to it by Osram Lamp Works, Ltd., in connection with the pending summons for an injunction to restrain the Gabriel Co. from alleged infringement of Osram patents was before the Appeal Court on Monday and Tuesday last. The Master of the Rolls, Lord Justice Buckley, and Mr. Justice Channell, were unanimous in allowing the interrogatories, thus reversing Mr. Justice Eve's decision in the Chancery Division (ELECTRICAL ENGINEERING, March 5th, p. 139). The interrogatories objected to asked whether certain lamps supplied to the Gabriel Co. were made by the Compagnie Général d'Electricité of Paris, and if not, by whom were they supplied. It was argued by the Gabriel Co. that the identity of the manufacturer was only of assistance to Osram Lamp Works as a step to identifying the process used in the lamp manufacture, and that therefore the question was not a strictly relevant fact, and should be disallowed. It was further contended that the relevant issue was not how were the lamps made, but were they made according to the claims of a certain patent specification.

It is announced that Osram Lamp Works, Ltd., has issued a writ for alleged infringement of Patents Nos. 23,899/04 and 18,622/06 against Scholey & Co., Ltd., by the sale of Britannia Lamps.

## LATTICE ARMOURING

to "make good"

must be strong, flexible, elastic, rust-resisting, durable and of the pattern best adapted to the special requirements of any particular job.

## "PRANA" LATTICE ARMOURING

fulfils all these requirements and is also of excellent appearance and

VERY MODERATE IN PRICE.

♣ Made in a great variety of patterns in steel and brass wire, flat lattice pattern, &c., &c.

♣ Specially designed for covering Flex.

♣ Insulates against heat—protects from fire. Indispensable for Chandeliers, Irons, &c., &c.

♣ Send for descriptive illustrated Price List.

## AERATORS LIMITED

(Dept. E k.) Upper Edmonton, London, N.

### ELECTRIC SIGNS

WE illustrate here an unusual application of the electrically-illuminated sign which has been made by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.). Two of this type of sign are usually supplied, one for each side of the door, and they are curved to take the door jamb corner. Illuminated name-plates of this description are comparatively a novelty, and are very effective as an advertising device, being equally visible by day or night. The difficulty generally presented by this class of sign is to secure adequate and even illumination; taking into account the very small space allowed between the front of the sign and the wall itself. As a general rule, lamps in fairly large numbers are used in order to get satisfactory results. In this particular instance sixteen 2½-c.p. lamps

were employed, which gives very even illumination.

**Visit to the Ediswan Works.**—The Ponders End, Middlesex, Works of the Edison & Swan United Electric Light Co., Ltd., were visited on Thursday last by the Association of Engineers-in-Charge. The lamp department was seen in the following order:—Glass making, bulb blowing, tube drawing, manufacture of carbon filaments, flashing filaments, preparing and mounting metal filaments, jointing filaments, stem making, sealing-in filaments, exhaustion of lamps, capping, stamping and testing of the finished lamp. Demonstrations and regular work were carried on during the tour, and explanations were given of the various processes by the most experienced members of the staff. In the engineering department the visitors were shown the complete manufacture of holders, switches, plugs, and other electrical accessories, and in the large turret shops a great variety of automatically turned brass and iron work. The manufacture and assembly of large switches, high-tension switch-gear, and other electrical goods were seen in the large brass shop. Electric fans and heating apparatus, including all forms of Bastian radiators, were shown during their entire manufacture. Passing on to the foundry, the process of iron and brass casting was demonstrated, and the remainder of the tour included the subsidiary processes of stamping, nickel and silver plating, slate enamelling, lacquering, &c. Tea was served in the general offices, during which the Chairman of the Association's Education Committee expressed a vote of thanks for the cordial reception of the visitors and of the visit's educational value. Mr. E. Gimmingham briefly replied on behalf of the directors and staff.

**The Strength of Metal Filament Lamps.**—The General Electric Co., Ltd., call our attention to a note in a contemporary to the effect that an electric hand lamp which dropped down the shaft of a colliery 760 ft. deep was smashed as far as the case and the accumulator were concerned, but that the Osram bulb was found to be intact, and was, in fact, used straight away in conjunction with another accumulator.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Barwell.**—A Board of Trade inquiry was held last week at Hinckley concerning an application by the Midland Electric Light & Power Co. for a provisional order for supplying in Barwell and Earl Shilton.

**Belfast.**—Mr. T. W. Bloxam, the City Electrical Engineer, recommends the installation of a 1,000-kw. battery, with boosters and switchgear, at an estimated cost of £10,800. This is a temporary expedient to carry the department over the period before the erection of the first section of the new power station, the only other alternative being to refuse applications for supply or to curtail the tramway service. Both of these, however, the Tramways and Electricity Committee regard as out of the question, and recommends the Council to adopt the above proposal.

**Glasgow.**—Twelve months' supply of cables, meters, and arc-lamp carbons. City Electrical Engineer. April 27th.

**Howe.**—The Consulting Engineers, Messrs. Handcock & Dykes, contemplate an expenditure of £20,000 upon the electricity undertaking.

**Leeds.**—One 12,000-kw. turbo-alternator with surface condensing plant. Electrical Engineer. May 11th. (See an advertisement on another page.)

**London: St. Pancras.**—The Finance Committee of the L.C.C. recommends the sanction to the following loans:—Mains, £7,055; machinery, £1,292; house services, £1,040; meters, £125.

**Middleton.**—Extensions at an estimated cost of £6,000 are contemplated.

**Nottingham.**—Twelve months' supply of cables, mains accessories, and electrical sundries. City Electrical Engineer. April 16th.

**Torquay.**—Two water-tube boilers, fuel economiser, steam pipes, &c. Borough Electrical Engineer. April 20th.

**Tunbridge Wells.**—One 300-kw. steam prime mover with alternator and exciter. Borough Electrical Engineer. April 22nd.

**West Bromwich.**—Mains extensions at an estimated cost of £1,450 are to be carried out.

**Worcester.**—An expenditure of £500 is contemplated upon a new sub-station.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Blackburn.**—Swimming bath. Architect, J. Hayhurst, 82 Richmond Terrace.

**Blackpool.**—Rebuilding, (after fire) printing works of H. Maxwell & Co.

**Bury (Lancs.).**—Cinematograph theatre. A. E. Millward, 9 Knowsley Street.

**Croydon.**—Fourteen houses, Sefton Road. P. Richardson, 80 Addiscombe Avenue.—Twelve houses, Ashburton Avenue, and sixteen houses, Compton Road. T. G. Crump, 5 Station Road.—Twelve houses, Teevan Road. Higgins & Thelmersen.

**Hastings.**—East Sussex Hospital (£50,000).

**Prestwich.**—Alterations to County Asylum.

**Wallasey.**—Cinematograph theatre, Victoria Road, Seacombe. W. J. Embank.

**Willesden.**—New school. Middlesex Education Committee.

## TENDERS RECEIVED AND ACCEPTED

**Blackburn.**—A contract has been placed with the Electric Construction Co. for a twelve months' supply of motors. The same Company has received an order for a three-wire booster.

**Blackpool.**—A contract has been placed with the United Electric Car Co. for six toast-rack cars.

**Bristol.**—The Electrical Engineering & Equipment Co., Ltd., has been awarded the contract for the complete electrical equipment of the forthcoming international exhibition, including mains, arc, incandescent, and "strip" lighting, main and distribution switchgear, and centrifugal pumps and motors for the cascades.

**Leeds.**—The contract for the reconstruction of certain portions of the tramway track has been placed with Messrs. D. Speight & Sons.

**London: Battersea.**—The following tenders have been accepted for twelve months' supplies:—Consumers' fuse-boxes, British Insulated & Helsby Cables; electrolytic meters, Reason Manufacturing Co.; troughing, bridges, bitumen, &c., Callender's Cable & Construction Co.; carbon-filament lamps, British Thomson-Houston Co.; box compound, Dussek Bitumen Co.

**Hammersmith.**—A tender by Messrs. Ferranti for six 10-kw. open-type transformers at £12 each has been accepted. These transformers are to be placed in switch pillars in connection with street lighting, experiments with them having shown that considerable improvement has been effected in the reduction of the loss of energy in the mains, and in the general lighting.

**L.C.C.**—The Asylums Committee has placed a contract with Siemens Bros. Dynamo Works for Tantalum and Wotan lamps.

**L. & N.W. Railway.**—Messrs. Balcke & Co. has received an order for eight natural-draught chimney-type cooling towers having a capacity of 2,000,000 gallons of water per annum for the new power station at Stonebridge Park. This, we are told, is the largest cooling-tower contract ever placed in this country.

**Manchester.**—The following, among other tenders for supplies, have been accepted by the Tramways Committee:—Motor and controller spare parts, British Thomson-Houston Co., Dick, Kerr & Co., British Westinghouse Co.; drawn-wire filament traction lamps, Drake & Gorham; incandescent lamps, switches, bells, telephones, and testing instruments, General Electric Co.; tantalum lamps, Siemens Bros. Dynamo Works; impregnating insulation varnish, Pinchin, Johnson & Co.; carbon brushes for motors, Morgan Crucible Co.; arc-lamp carbons, Baxendale & Co.

The Electricity Committee has accepted tenders for cable by the British Insulated & Helsby Cables, Electrical Engineering & Equipment Co., Johnson & Phillips, and the Western Electric Co.

The General Electric Co. has received an order for 12-ampere "Angold" magazine lamps for the lighting of Oxford Street and Peter Street.

**Middlesbrough.**—A contract has been placed with Siemens Bros. Dynamo Works for a twelve months' supply of Tantalum, Wotan, and carbon lamps.

**Southampton.**—Messrs. Siemens Bros. Dynamo Works have received a contract from the Southampton Harbour Board for a twelve months' supply of Wotan, Tantalum, and carbon lamps, and also for glassware.

**York.**—A contract has been placed with the General Electric Co. for a twelve months' supply of Osram lamps.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £67 15s. to £68. (Last week, £66 15s. to £67 5s.)

**Conduit.**—Gillespie & Beales (Amberley House, Norfolk Street, Strand, London, W.C.), whose "G. & B." cables are so well known, have recently placed upon the market a line of conduit which is of unusually heavy quality and good finish. This conduit will be known as "G. & B." conduit, and prompt delivery can be given of all the usual sizes of close joint, welded, and solid drawn, with a full range of corresponding fittings.

**Liquidations.**—A meeting of creditors of the Electromobile Co. will be held on April 16th, at 12 noon, at the Connaught Rooms, Great Queen Street, W.C.

USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London,

## LOCAL NOTES

### **Birmingham:** *Electrical Contractors and Municipal Trading.*

—The Birmingham branch of the Electrical Contractors' Association held its Annual Dinner last week, and the occasion was taken to enter an emphatic protest against the present-day extension of municipal trading. Fortunately for the contractors, Birmingham is one of those cities which has wiring powers but has never exercised them, the reason given by Mr. H. Foulds, Secretary of the Birmingham Corporation Electricity Department, being that the electrical contractors in that city are so enterprising that there has been no necessity for the Supply Department to come in.

**Deal and Walmer:** *Electric Supply.*—The Bill of the Deal and Walmer Gas Co., which seeks powers to supply electricity in Deal and Walmer, has been before a House of Commons Committee. Both the Deal and Walmer local authorities are opposing, as well as the South-East Kent Electric Power Co., which already possesses powers to supply in detail in the district, and has erected a power station at the Tilmanstone Colliery in the Kent coalfields, five miles away. The Sandwich, Deal, and Walmer Electricity Supply Co. has also an electric lighting order for this area, but similarly to the Power Co. nothing has been done to give a supply in the district. The proposal of the Gas Co. now is to acquire the order of the Sandwich, Deal, and Walmer Electricity Supply Co. for a sum of £1,100, and to place itself under compulsion to supply within two years. The usual arguments are being placed before the Committee as to the greater facilities which gas companies have in small towns for dealing with electricity supply, and Ascot, Farnham, and one or two other places are being instanced as successful undertakings of this character. A number of London electrical and financial firms have inspected the area, but although they report that, as a commercial proposition, an undertaking would pay, it was not considered sufficiently large enough to be taken up by them. Mr. W. H. Patchell gave evidence in favour of the electricity proposal and estimated an immediate expenditure of £13,000 and an ultimate expenditure of £34,000, and on Tuesday the Committee gave the Gas Co. the electricity powers for Deal and Walmer. Clauses are to be inserted, however, giving the respective local authorities the right to purchase the electricity powers within twelve months. The Chairman remarked, incidentally, that he did not believe the Councils really intended to take up the matter of electric supply.

**Derby:** *Electrical Contractors' Association.*—In Derby, as in Birmingham, the relations between the Corporation Electricity Supply Department and the contractors are of a cordial character. At the first Annual Dinner of the Derby branch of the Association last week, Mr. T. P. Wilmshurst, the Borough Electrical Engineer was a guest, and responding to one of the toasts, wished the branch every success.

**Dublin:** *Electricity Accounts.*—The Finance Committee of the Corporation, in reporting increases in rates for the ensuing year, points out that the electricity receipts for the next twelve months are estimated to be considerably less in consequence of increased expenditure due to labour troubles delaying the delivery of the new plant. An increase in expenditure of some £3,000 is estimated during the forthcoming year.

**Erith:** *Gas Co. and Electric Supply.*—The South Suburban Gas Co. in its Bill now before Parliament, originally included powers to generate electricity for its own purposes and to dispose of any surplus available. No area was scheduled, and, not unnaturally, there was considerable opposition to it by the local authorities concerned. We now understand that the Company has withdrawn all the provisions in the Bill relating to electric lighting.

**Foot's Cray:** *Electric Supply.*—On page 200 of our issue for April 2nd we referred to an application by the Foot's Cray Electricity Supply Co. to the Woolwich Borough Council for terms for a bulk supply. An offer has also been made by the West Kent Electric Co., but the Bexley Council's Electrical Engineer recommends that a supply be given from the Bexley Council's Works at £3 5s. per kw. per annum plus 0'33d. per unit, provided a coal clause is in the agreement.

**Kidderminster:** *Dispute about an Electric Cable.*—An interesting case has been occupying a King's Bench Judge in London during the past week, in which the Kidderminster & Smethport Electric Tramway Co. claims damages against

a local firm of carpet manufacturers who had tunnelled underneath the Company's tramway track in order to lay a cable from one of its works to the other, which is on the other side of the road. The dispute between the two parties has evidently been a matter of considerable local interest, if not amusement, for when the Tramway Co. found, as they alleged, that their tramway track was inclined to subside at the spot in question, men were sent down to strengthen the foundations of the track, and incidentally, and, according to the evidence, accidentally, cut the Carpet Co.'s cable. A second cable was then laid—hence this action, in which the Carpet Co. is counter-claiming for damages in respect of the damage to the first cable. In his judgment, Mr. Justice Rowlatt took a very severe view of the Tramway Co.'s attitude in the matter, which he said was intended to intimidate the Carpet Co. in order that the latter should take a supply of current from the Tramway Co., which also supplied for lighting purposes. He therefore gave judgment for the Carpet Co. in the action, and also on the counter-claim, granting £100 damages and costs in respect of the cut cable.

**Leeds:** *The New Power Scheme.*—The new power scheme involving an expenditure of £200,000 referred to in our "Tenders Invited" columns last week has now been sanctioned by the Corporation. There was, however, some opposition to passing the resolution on the ground that more time should be allowed members to consider one of the most important proposals ever put before the City Council.

**Lurgan:** *Electric Lighting.*—A Local Government Board inquiry concerning an expenditure of £12,000 for the municipal electric lighting scheme was held last week. We referred to the proposal on page 183 of our issue for March 26th.

## APPOINTMENTS AND PERSONAL NOTES

Mr. F. Heppenstall has resigned the position of Manager of the Switchgear and Transformer Department of Johnson & Phillips, Ltd. (Charlton, S.E.), to take up an appointment with the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), where he will devote his attention to matters in connection with wires and cables.

The Highways Committee of the L.C.C. recommends the appointment of Sir Alexander Kennedy as Consulting Engineer in connection with engineering matters concerning the Council's generating station and tramways undertaking, at a retaining fee of £500 per annum, with a commission of 5 per cent. on all plant up to £50,000 per annum, and 4 per cent. on expenditure over this amount. The commission on the construction work connected with the second stage of the extensions at Greenwich, for which the specifications have already been prepared, is to be 3 per cent.

Mr. W. Fennell, Borough Electrical Engineer at Wednesbury, has resigned. The Lighting Committee recommends Mr. John Smith, the Assistant Engineer, to succeed him.

It is recommended that the salary of Mr. F. V. L. Mathias, Chief Electrical Engineer and Tramways Manager to the Warrington Corporation, be increased to £450 per annum.

A working engineer-in-charge is required for the heating and electric generating plant at the Northampton Polytechnic. Wages, £2 10s. per week of 54 hours. The Principal.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**County of London Electric Supply Co.**—The issue of new capital referred to in our last issue was largely oversubscribed. This fact the company regard as particularly significant in view of the prominent part it has played in the London Electric Supply Scheme. The second reading of the Company's Bill dealing with the matter has been deferred until Monday, April 20th.

**General Electric Co.**—Subscription lists closed on Tuesday for an issue at par of 30,000 six per cent. £10 cumulative preference shares, and 10,000 ordinary shares of similar value.

**British Westinghouse Co.**—The report and accounts given in our last issue were passed at the annual meeting on Tuesday. Mr. J. Annan Bryce referred to the contract with the London & South Western Railway Co., and also to the fact that the orders during the three months of the present year have not shown any appreciable falling off.

## SUMMARY

THREE candidates, Messrs. John Christie, Frank Ayton, and R. J. Wallis-Jones, have been put forward as candidates for the Council of the Institution of Electrical Engineers, in addition to those nominated by the Council itself. (Page 212.)

THE position with regard to the wiremen's strike in London is practically the same as it was last week. (Page 212.)

MESSRS. MERZ & McLELLAN's report to the L.C.C. on "London Electricity Supply" was issued yesterday. It recommends the gradual replacement of the existing stations by new stations on sites lower down the river, and also the supplementing and gradual replacement of the distribution networks by new three-phase networks, and the establishment of a new undertaking for the purpose of gradually concentrating production, standardising distribution, and amalgamating all the existing undertakings so far as is possible without compulsory powers or competition.—The Bill promoted by the County of London Electric Supply Co. in conjunction with certain banking firms, has been dropped. (Page 213.)

SOME results of tests of a Kapp vibrator, which is a form of phase advancer are published. (Page 214.)

THE differences in the behaviour of the motor of an electrically-driven boat when tested by running with the boat moored and when under way are discussed in our Questions and Answers columns. (Page 215.)

A PATENT specification relating to electrically-driven ships' steering-gear by the British Thomson-Houston

Co. was among those published last Thursday. Among the others was one by the British Electric Transformer Co. and R. Crosbie-Hill for an arrangement of auxiliary transformers with the main one to keep any damage due to pressure rises limited to a defined area and to provide for pressure regulation without tappings.—Another specification, by Siemens-Schuckertwerke Ges., deals with the driving of rotary printing presses and paper calendaring machines.—A patent by F. R. Simms and R. Bosch, embracing the rotating armature ignition magneto expires during the current week after a full life. (Page 216.)

THE Annual Patents Report for 1913 is reviewed (Page 217.)

THERE has been a conference between the Switchgear Committee of the B.E.A.M.A. and Mr. G. S. Ram, H.M. Electrical Inspector of Factories, regarding the interpretation of some of the Home Office Regulations. Mr. Ram's replies will be added to his memorandum on the Regulations. (Page 217.)

BOARD OF TRADE reports into two recent tramcar accidents on curves find that they were both due to excessive speed. (Page 217.)

SOME statistics relating to the number of telephones in Canada are given.—The American Marconi Co. is not paying any dividend.—An automatic recorder of wireless signals, invented by MM. Ducretet and Roger, records signals from the Eiffel Tower at a distance of 500 km. (Page 218.)

A WEAVING shed lighting installation in which the dynamo is driven by the main engine is described in our Trade Section, which also contains articles on underground station lighting and a large cable contract, and illustrated descriptions of new holders for half-watt lamps, and electric griddle plates. (Pages 218 to 220.)

A 5,000 kw. turbo-alternator set is required at Manchester; generating plant also at Blackrock, Burton-on-Trent, Malvern, and Torquay.—Street lighting schemes are under consideration at Bacup and Malton (Yorks.).—Two railless traction routes are to be constructed at Mexborough. (Page 221.)

MR. J. F. C. SNELL reports favourably upon the management of the Dartford electricity undertaking.—Messrs. Handcock & Dykes have reported upon the Redditch undertaking, and recommend new plant being installed.—The Marylebone Council is offering electric irons, toasters, and kettles on favourable hire-purchase terms.—The central suspended system of street lighting is being abandoned in Accrington.—The Wednesday Council is abandoning "free" wiring. (Page 222.)

BABCOCK & WILCOX pay a dividend of 9 per cent. for the half year. The net profits amounted to £446,073.—The General Electric Company's new issue of capital was considerably oversubscribed. (Page 222.)

## ARRANGEMENTS FOR THE WEEK

SATURDAY, APRIL 18TH.

*Birmingham and District Electric Club.*

7 p.m. At Swan Hotel, Birmingham. "Some Remarks on the Use of Chain Gearing," by H. T. Hildage.

MONDAY, APRIL 20TH.

*Institution of Post Office Electrical Engineers.*

5 p.m. Annual General Meeting at Institution of Electrical Engineers, Victoria Embankment.

TUESDAY, APRIL 21ST.

*Institution of Railway Signal Engineers.*

2 p.m. At Midland Grand Hotel, St. Pancras. "Characteristics and Efficiency Factors of Some Typical Electric Signalling Circuits," by G. H. Crook.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. Annual General Meeting, at 207 Bath Street, Glasgow. "Current-limiting Reactances on Large Power Systems," by K. M. Faye-Hansen and J. S. Peck.

WEDNESDAY, APRIL 22ND.

*The 25 Club.*

7.15 for 7.30 p.m. Dinner at Connaught Rooms, Great Queen Street, W.C.

*Association of Mining Electrical Engineers.*

7.30 p.m. West of Scotland Branch. Annual General Meeting at Royal Technical College, Glasgow.

*Faraday Society.*

8 p.m. At Institution of Electrical Engineers. Among the Papers down for reading is "Recording Pyrometers," by C. R. Darling.

THURSDAY, APRIL 23RD.

*Institution of Electrical Engineers.*

8 p.m. "Electrification of Railways as Affected by Traffic Considerations," by H. W. Firth.

**U.S. Central Station Statistics.**—From the quinquennial report on the central station of the United States issued by the Bureau of the Census, we note that the number of public supply undertakings increased from 2,805 in 1902 to 3,659 in 1912, or by 30 per cent. Municipal undertakings increased from 815 to 1,562, or by 92 per cent. The total income increased by 252 per cent., and the total expenses by 244 per cent. The increase in the number of employees was 162 per cent. The total output increased from 2,507 million units in 1902 to 11,503 million units in 1912, an increase of 359 per cent. Arc lamps in use increased by 31 per cent., and incandescent and other types by about 320 per cent. The h.p. rating of stationary motors connected was 438,006 in 1902, and 4,130,619 in 1912, being an increase of 843 per cent.

## THE INSTITUTION COUNCIL ELECTION

THREE candidates for the Council of the Institution of Electrical Engineers are being put forward in addition to those nominated by the Council, a list of whom was published in our issue of April 2nd.

Mr. John Christie (Borough Electrical Engineer, Brighton) and Mr. Frank Ayton (Borough Electrical Engineer, Ipswich) have been nominated by several of the leading municipal engineers, who feel that the provincial representation on the Council should be wider, and that the South and East of England should not be without representatives.

The third candidate is Mr. Reginald J. Wallis-Jones, the well-known and popular consulting electrical engineer. He has been nominated and supported by the following gentlemen:—

Sir David Salomons, E. Garcke, G. W. Spencer Hawes, C. W. S. Crawley, F. H. Nalder, Theodore Stevens, J. H. May, Frederick W. Purse, F. W. Smith-Cleburne, Theodore Schonthell, E. Cooper Wallis, L. B. Atkinson, F. B. O. Hawes, A. L. C. Fell, Albert Gay, John Christie, F. H. Nalder, H. M. Leaf, William White, Douglas Knight, Justus Eck, E. J. Fox, Prof. J. T. Morris, N. W. Prangnell, P. A. Lundberg, H. W. Miller, Albion T. Snell, A. Schneider, H. H. Berry, Sydney Dobson, John Bradwell, F. J. Downe, Reginald Belfield, W. B. Esson, Arthur Bergthell, and E. E. Hoadley.

**The Wiremen's Strike.**—The condition of affairs in connection with the wiremen's strike in London is practically as it was last week, but there are signs of the men giving way. The masters show no inclination of acceding to the men's demand that the so-called "disability" clause should be expunged from the working rules, and as in any case there is much less wiring work to be done in London than usual at this time of the year, no great inconvenience is being caused by the strikers being still out of work. There was a case of a "sympathetic strike" of transport workers on one of the outgoing liners being threatened, owing to non-union electricians being employed on overhauling work, but this latter was just being finished when the pickets came up, and in consequence the electricians were able to leave, and there was no trouble.

## The London Electrical Engineers.

Headquarters (46 Regency Street, S.W.) open Sat. till noon.

**Rating Exam.** for all Cos. from 7 to 10 p.m. every Wednesday.

(To-day) THURSDAY, APRIL 16TH, C. Co. FRIDAY, APRIL 17TH,

D. Co. MONDAY, APRIL 20TH, A. Co. TUESDAY, APRIL 21ST,

B. Co., Tech. Inst., 7 to 10 p.m. Min. Range, 7 to 9 p.m.

WEDNESDAY, APRIL 22ND.—Recruit Instruction, 7 to 10 p.m.

ANOTHER EASTER FATILITY.

## THE LONDON ELECTRICITY SUPPLY SCHEME

## Messrs. Merz and McLellan's Report.

## The Bill Withdrawn

MESSRS. MERZ & McLELLAN'S report to the London County Council on "London Electricity Supply" was issued at 11.30 yesterday morning.

Considering first the question of generation, it is pointed out that there are practically only two ways of effecting important economies: (1) The extension of eight or ten of the best existing stations, and the gradual abandonment of all the others; or (2) to aim at the gradual abolition of all the stations in or near the Metropolitan area, and to concentrate the production of electricity for all purposes on sites well outside. In considering these two alternatives, Messrs. Merz & McLellan have calculated the cost of production, assuming that ten stations of the most recent type were erected approximately on existing sites, and have compared this with the cost with an equivalent plant lower down the river, plus the cost of transmission to London. On the question of concentration they point out that the general rule which should guide this is that it is economical to continue concentration so long as it is possible to do so by increasing the size and not the number of the individual generating sets. In any case, the sites must be on the river, but the disadvantages of placing them near the load are, the difficulty of storing coal on most of the existing sites, or handling it in the best way, the extra cost of coal "above bridge," the impossibility of by-product developments, and the hygienic and other disadvantages of large fuel consumption near London. Further, the cost of transmission mainly consists of capital charges, and the cost per unit will decrease as the load-factor improves, while the cost of coal remains the same. Consequently, as time goes on any advantages which there might be in having the stations nearer the load will diminish. The establishment of stations at the coal-fields is not recommended for various reasons, the chief one of which is that except for that portion of the load with a very high load-factor, any possible saving in the cost of handling the coal would be more than counterbalanced by the increased cost of transmitting electricity. Messrs. Merz & McLellan consider, however, that it is possible that it may prove profitable at a later date, when extensions are required, to supply the high load-factor portion of the load from sites situated further from London than now proposed.

In recommending the erection of ten entirely new stations lower down the river instead of utilising the existing ones, Messrs. Merz & McLellan say that if all the existing stations were in the hands of one authority, it would pay to shut them down, sell most of the plant, and generate all the electricity at new sites down the river. The saving in working costs in the central area would, they say, be not less than 18 per cent., or about £170,000 a year, after allowing for all capital charges, and this, in conjunction with the present sinking funds, would enable the existing generating plant to be written off by 1931. The initial capital outlay for this purpose, allowing for growth in demand during the next four years, would be between six and seven million pounds. On the other hand, to supply the general domestic demand from ten model stations on any of the present sites would cost at least 20 per cent. more than from plant concentrated on sites down the river, and if the comparison were made with ten of the best existing stations, rearranged and utilised to best advantage, the extra cost would be still greater.

On the question of distribution, Messrs. Merz & McLellan recommend that the present systems, instead of being generally extended, should be supplemented, as required, by a high-pressure three-phase 50-cycle system. This, they say, would cost £3,000,000 less than the extension of the existing D.C. networks which would otherwise be necessary to meet the general domestic demand, and its adoption would reduce the total operating expenses by 12 per cent. In this connection a standard primary voltage should be at once adopted for all new high-pressure mains. For the D.C. distribution network they recommend a 500-volt three-wire system consisting of the existing networks with such slight additions and alterations as might be necessary, but this should not be extended, but should be supplemented by a new three-phase network.

On the control of the distribution, as distinct from the generation and transmission, the report does not give quite definite recommendations. The suggestions tend, however, towards the idea of the existing networks in some cases being retained by the present owners, and the sale of electricity

to all retail consumers being retained by the local distributors whether they own the network or not.

As the most satisfactory and economical method of achieving the above results, Messrs. Merz & McLellan recommend the establishment of a new undertaking with such powers as will enable it gradually to concentrate production, standardise distribution, and bring about amalgamation of all the various undertakings. They recommend that the London County Council should promote a Bill in the next Session of Parliament, empowering some central body to set up an undertaking with powers of bulk-supply and the means of gradually acquiring and amalgamating the different undertakings on commercial terms as far as possible without compulsory powers or competition.

In one of the appendices to the report, the present position of electricity supply in Greater London is reviewed. The total capital in 1912 is given at £25,997,399, of which £8,059,601 has been spent on plant and machinery. The total kilowatts connected is 523,865, the total plant installed represents 307,338 kw., and the sum of the maximum demands 196,721 kw. The average price obtained for all purposes was 2.29d. per unit, varying from 1.96d. as an average of the companies in Outer London, to 2.62d. as the average of the companies within the County of London. The average price obtained by the local authorities was 2.06d., both within the County and in Outer London.

The Bill of the County of London Electric Supply Co. for dealing with the problem of electricity supply in London has been withdrawn by the banking firms which promoted it. As we have already pointed out, all the other London electric supply companies, as well as the London County Council, intended to oppose this scheme when it reached the committee stage in the House of Commons. In a statement which has been issued it is announced that the Bill has been withdrawn "owing to the hostility of the engineers of certain of the London electric supply companies, and to dissensions between these companies which have prevented their combined support." Mr. W. F. Fladgate, Chairman of the Charing Cross, West End, and City Electricity Supply Co., points out, however, in a letter to *Friday's Times*, that this statement is not accurate, as the Boards of all the companies except one were opposed to the Bill. "Also," he says, "it is right to say that there was no hostility on the part of the engineers; the result of their investigations was simply to show that the proposed scheme had not the remotest possibility of financial success. It is noteworthy that in Mr. Merz's report, which you quote, it is suggested that the average price in London for current is 2.35d. per unit, and that this is a high charge. The promoters of the Electric Supply Bill based their estimates on an average revenue of 2.63d. per unit."

**The Lighting of a Cinema Studio.**—As evidencing the uses of electricity in cinematograph studios, the *Electrical Review* and *Western Electrician* (Chicago) gives some particulars of the studios of the Selig Polyscope Co. of Chicago. There are two studios. The main one, in which there are two stages, measures 179 ft. long by 80 ft. wide. On the large stage seven or eight scenes can be set at one time. There are 15 Cooper-Hewitt quartz-tube mercury-vapour lamps in each studio. In the large studio these are hung from a travelling frame about 10 ft. above the floor. Each lamp gives approximately 4,500 c.p. directly underneath. In addition there are banks of ten 800-c.p. mercury-vapour lamps and frames. Usually two of these frames are employed on each side of the scene being photographed. The tubes of these lamps are 50-in. long, and they are placed in a vertical position, arranged to be raised or lowered as required. The light from all the lamps approximates to 100,000 c.p. Leads from the main supply are run to portable distributing boxes, where connections are made for the various banks of lamps. The boxes, as well as the banks of lamps, are on rollers, and can be easily moved. Where necessary, purely local or "spot" lighting is used in addition. Electric motors are used for all the auxiliaries.

**Street Lighting in Large Cities.**—According to the *Electrical World* (New York), Mr. C. F. Lacombe (chief engineer, water, gas, and electricity departments, New York), has stated that much higher illumination is used for street lighting in the large cities of Europe than of America. In London, Paris, and Berlin, the principal streets show intensities as high as 7.9 ft.-candles to 2 ft.-candles near the sources of light, with minima of 0.25 ft.-candle to 0.5 ft.-candle at more remote points. In New York similar streets have maximum intensities not exceeding 1.2 ft.-candles on the road surface, while the minima fall as low as 0.08 ft.-candle. In Fifth Avenue, directly beneath the double-lamp standards, intensities of 1.7 ft.-candles are found, with minima of 0.05 ft.-candle. All high c.p. flame arcs in Europe are placed from 3 ft. to 10 ft. higher than is the practice in America. By this means clear glass globes can be used.

### TESTS ON A KAPP VIBRATOR

IN 1913 Dr. Gisbert Kapp read a Paper before the Institution of Electrical Engineers (*ELECTRICAL ENGINEERING*, Vol. IX., p. 239, May 1st, 1913), in which he described a new form of phase advancer, invented by him, and called the "Kapp Vibrator."

Messrs. Sandycroft, Ltd. (Sandycroft, near Chester), obtained last year a licence for the manufacture of these vibrators, and after careful experimenting have recently completed their first vibrator to be put into regular commercial service. This machine is working in conjunction with a 330-B.H.P. induction motor, built by Siemens Bros. Dynamo

FIG. 1.—KAPP VIBRATOR.

Works, Ltd., and is installed at the Chemical Works, late H. & E. Albert, South Bank, near Middlesbrough. The motor is a 12-pole machine, operated from the system of Cleveland & Durham Electric Power, Ltd., who supply energy at a pressure of 2,750 volts at 40 cycles per second.

The vibrator is a phase advancer, or exciter, for use with induction motors or generators respectively, and consists of a magnet frame carrying three sets of 2-pole field magnets, in which revolve three armatures of the usual continuous-current type. The three armatures are connected in mesh to the slip-rings of the induction motor, as shown in Fig. 2, which shows all the necessary connections. In some cases it may also be desirable to provide an interlocking arrange-

FIG. 2.—DIAGRAM OF ROTOR CIRCUIT WITH KAPP VIBRATOR.

ment, to prevent the motor being started with the vibrator in circuit, that is to say, practically on short-circuit.

The field windings are excited with continuous current. The low-frequency rotor currents in the armatures cause the latter to rotate first in one direction and then in the opposite direction with the frequency of slip. This rotation induces in each armature a voltage which is opposed to the E.M.F. of self-induction of the motor, and is greater than the latter by an amount sufficient to supply through the resistance of the rotor windings the necessary current to produce the magnetic field of the motor. With normal excitation of the

vibrator no magnetising current flows in the stator windings, and consequently the motor operates with a power-factor of unity. If the exciting current be increased the greater voltage then induced by the rotation of the armatures will produce in the rotor windings a magnetising current greater than that necessary to produce the magnetic field of the motor, and consequently a leading current will result in the stator windings.

Fig. 1 shows the actual vibrator in question, which is a small and compact machine. The armatures are only 10 cms. in diameter, and at full load with a slip of 2.45 per cent. rotate about  $3\frac{1}{2}$  revs. in each direction. Since the frequency of supply is 40 cycles per sec., they change their direction of rotation every half second.

The results of the tests made are plotted in Fig. 3, which shows that at half load the power-factor was 0.99 leading, and at full load 0.96 leading. The corresponding power-factors without the vibrator were 0.76 lagging and 0.87 lagging respectively. The machine was guaranteed to give unity power-factor from half load to full load, and when the field current was adjusted for the latter value the excitation loss in the fields of the vibrator was only 50 watts.

The vibrator will work equally well with an induction machine running either as a motor or a generator without

FIG. 3.—POWER FACTOR CURVE OF 330 B.H.P. MOTOR WITH KAPP VIBRATOR.

change of connections, so that when used with machines driving winding engines or locomotives complete compensation would be obtained under all conditions. A valuable feature of the vibrator is that in the event of any mishap (such as, for instance, the failure of the field) it may be left in circuit, even although failing to fulfil its function as a phase advancer, without affecting the running of the motor with which it is installed. The use of a vibrator improves the operating qualities of a motor not only by correcting the power-factor, but also by considerably increasing its overload capacity and maximum torque. Under favourable conditions the efficiency of the motor will be improved. The overload capacity will be increased because not only the stator currents, but also the rotor currents, of the motor will be reduced when the motor is operating above the load corresponding to its maximum power-factor.

The vibrator described above was installed to the order of Cleveland & Durham Electric Power, Ltd., and was built at the works of Messrs. Sandycroft, Ltd., near Chester. By the courtesy of the Chemical Works, late H. & E. Albert, it was inspected on March 20th last by Dr. Kapp and a large number of engineers connected with the Newcastle and Tees-side Local Sections of the Institution of Electrical Engineers.

**Celluloid and Incandescent Lamps.**—The report of the Departmental Committee on Celluloid has been issued by the Home Office, and contains a valuable collection of information as to the inflammability of this widely used material. Amongst other matters, results of tests are given, in which sheets, films, and other celluloid articles were placed in contact with incandescent lamp bulbs. In the case of a 32 c.p. carbon lamp with a bulb temperature of 280° C., a piece of film ignited in 15 seconds, and a piece of transparent sheet in 30 seconds. With a 16 c.p. carbon lamp (bulb temperature 190° C.), all the articles only "fumed off" when placed in contact with the bulb, but films could be ignited in 1 min. 15 secs. by wrapping twice round the lamp. With a 28-watt metal filament lamp (bulb temperature 138° C.), films laid in contact with the lamp were unaffected in one hour, but ignited in  $3\frac{1}{2}$  minutes when wrapped twice round the lamp. The report contains many recommendations regarding safety precautions in factories where celluloid is made or used.

**Iron and Steel Institute.**—The annual meeting of the Institute will be held at the Institution of Civil Engineers on May 7th and 8th inst. Among the Papers down for reading is one by Sir Robert Hadfield and Prof. B. Hopkinson on the "Magnetic and Mechanical Properties of Manganese Steels." The annual dinner will be held on May 7th.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

#### QUESTION No. 1,387.

The primaries of three single-phase transformers are connected up in mesh, and are supplied by a three-phase system. The secondaries, also connected up in mesh, feed a balanced, three-phase, non-inductive load. One primary phase is open circuited on account of an internal breakdown other than a short circuit. What must I do to maintain the supply, and what changes take place in the currents in each of the windings and in the currents in the live wires, assuming the load to remain unaltered?

(Replies must be received not later than first post, Thursday, April 23rd.)

#### ANSWER TO No. 1,385.

A 50-h.p. shunt-wound interpole motor is used for driving a motor-boat direct on the propeller. During some trials with the boat moored, the speed of the motor was 30 per cent. under full speed while the motor was taking full load current. It was impossible to obtain a higher speed than this, as the current rose to a dangerous degree, while the shunt regulator was moved very slightly. Suggest the cause of this loss of speed and control, and state if better results should be expected with a trial under way.—"STOKER."

The first award (10s.) is made to "G. C." for the following reply:—

It does not seem to be realised generally that marine motors are subject to the heavy loads which are obvious with motors driving heavy types of machinery, such as machine tools, &c., and very often purchasers underrate their motors considerably when required for this purpose. Marine motors are certainly not subject to the severe jars as a motor, say, coupled direct to a heavy machine tool. However, the load is by no means light, and when the boat is moored the motor is subject to its heaviest load, as the torque on the motor armature is at its maximum. This is evidently the case with "Stoker." He is assuming that the motor is running practically light, whereas it is taxed to its utmost. It is obvious that if a boat fully loaded will travel through the water in preference to remaining stationary that the moving boat has a lighter load. This could be proved by the following method if same was practical:—Take a trial under way with a light load, and note the input to the motor, then gradually increase the load in the boat by passengers or weights until the motor has not sufficient power to propel the boat. This is equivalent to the boat being moored, as the propeller has to revolve in still water, and cannot cut its way through it. Now measure the input to the motor, and it would be found that the normal current was considerably exceeded, providing the capacity of the supply was able to deal with the increased load, and the shunt regulating resistance had been put in to keep the speed up. If, however, the supply could not cope with the increased current the terminal volts of the motor would fall, and the speed drop in consequence. However, as the motor is fairly large (50 h.p.) the boat is evidently of considerable dimensions, and the above test impracticable, but it could be proved with a boat and motor of smaller dimensions. I suppose "Stoker" is aware that the propeller of a boat is very similar to the

action of a screw thread. If we ignore the slip of the propeller we can give an example as follows:—Take a length of screwed rod and a nut to fit. If the nut is revolved it will run freely up and down the rod, but if any pressure is brought to bear on the nut in the opposite way to which it is travelling it will immediately get difficult to rotate. In the case of the moored boat the propeller is slipping all the time, instead of cutting its way through the water. This can be compared with a motor with a belt drive. If its machine was fixed and could not rotate, the motor pulley would slip the belt. It is well known that the armature current is proportional to the torque on the armature shaft in ft.-lb., and increased torque means increased current. It is perhaps advisable to remind "Stoker" of the relation between torque and current, as expressed in the following formula:— $AE = \frac{T2\pi N}{746 \times 33,000}$  where  $A \times E$  = watts;  $T$  = torque in ft.-lb.;  $N$  = r.p.m.; 746 watts = 1 h.p.; 33,000 ft.-lb. = 1 h.p.

It is obvious from the above that much better results would be obtained with the boat under way.

The second award (5s.) is made to "ALPHA," who writes as follows:—

The rapid increase observed by "Stoker" in the power taken by the motor with a slight decrease of field current is readily accounted for. With a propeller of fixed diameter and pitch the velocity of the stream of water projected backwards will be practically proportional to the speed of the propeller in r.p.m. The kinetic energy in ft.-lb. (per sec.) of this stream of water will be  $\frac{Wv^2}{2g}$ , where  $W$  is the weight in pounds of the water passing through the propeller per sec.,  $v$  is the mean velocity of the water, and  $g = 32.2$ . This energy is all derived from the motor, through the propeller, and since  $W$  is evidently proportional to  $v$ , the power required to drive the propeller will be roughly proportional to the cube of the motor speed. Further, a shunt-wound interpole motor working on a load of this character is apt to be rather unstable, due to the fact that the armature current, and hence the interpole excitation, increases considerably with only a slight decrease of the shunt field current. This relatively large increase in the interpole excitation diverts some of the flux from the main pole to the interpole, thus further weakening the main field. The effect of this is to give a much greater speed increase for a given movement of the field rheostat than would be the case with a normal machine without interpoles. This effect is so marked that it is frequently found that shunt-wound interpole motors increase in speed with increased load, instead of having a slightly drooping characteristic, as in the case of shunt-wound machines without interpoles. To avoid this it is advisable to have a small series winding on the main poles of such machines, this series winding being of sufficient strength to ensure that the speed of the motor will not increase with increasing load. In this case the motor takes full load current at 70 per cent. of the full speed, and since the load is proportional to the cube of the speed, it is evident that the power required at full propeller speed with the boat moored would be approximately three times nominal full load. This is, of course, much more than the motor can be expected to give continuously, and it is probable that even with interpoles the motor would not operate under such an overload, even for a short time. It does not, however, follow that the motor is too small for the duty required, since the power required at full propeller speed with the boat moving will be much less than with the boat moored. The exact ratio between the powers required under the two conditions is difficult to calculate, and will vary widely for different designs of propellers. It will also be affected by the fact that under ordinary conditions the propeller is working in the open water, whereas when moored it may be in a confined space between other boats, or against the dock wall. However, assuming reasonable values for the efficiency and "slip" of the propeller, it would seem that the power required with the boat moored would be probably from two to four times that required at the same propeller speed with the boat free to move. In this case the rating of the motor would be about correct with the boat moving at full speed, but the data given are not sufficient to allow of a definite decision on this point. It would certainly seem, however, that the probability of satisfactory operation is sufficiently great to justify "Stoker" in taking the boat out for a trial under way. If in these circumstances the power taken is not found to be excessive, but trouble is experienced due to instability of the motor speed, a few series turns on the main-field spools as mentioned above would probably cure this.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published April 9th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in *italics* indicate communicators of inventions from abroad.

1,505/13. *Ships' Steering Gear*. B.T.-H. Co. (*G.E. Co., U.S.A.*). The motor-controller consists of two independent drum controllers connected by differential gearing, the intermediate element of which can be worked by the steering wheel to set one drum to drive the motor working the rudder, while this motion rotates the other drum so that through the gearing the first drum is brought to its original or "off" position. The motor is fed through a motor-generator whose generator field is varied by a rheostat controlled by the motor-generator shaft through a clutch and holding off magnet. Five figures.

6,286/13. *Purifying Copper*, &c. B.T.-H. Co. (*G.E. Co., U.S.A.*). Copper of a high degree of purity is obtained by melting the copper above a mixture of inert material and boric anhydride. The temperature is kept at about 1,300° C., while the boric anhydride is kept beneath by the inert material and the mass is stirred until the boric anhydride rises to the surface. The process may also be applied to silver, gold, &c.

6,799/13. *Transformer Arrangements*. BRITISH Elec. TRANS. Co. and R. CROSBIE-HILL. In order to provide for pressure regulation without tappings, and to locate damage due to pressure rises in primary or high-pressure windings, small capacity auxiliary transformers are connected in series with the primary of the main transformer, while the secondaries are connected to a supplementary winding associated with both the primary and secondary windings of the main transformer. Two figures.

6,817/13. *Insulated Cables to Stand Climatic Variations*. A. T. MIRZA. Insulating beads, separated by compressible distance pieces are threaded on the cables and sustain a waterproof covering. Five figures.

7,411/13. *Flame Arc Lamps*. G. E. TATE and F. O. MONKHOUSE. Three carbons, two positive and one negative, are arranged obliquely. The negative is engaged at the lower end by a carrier slide which is actuated to strike the arc by a bell crank lever, hinged to a rod which is also pivoted to a rocking lever controlled by the series solenoid. Five figures.

17,490/13. *Resistance Furnace*. F. FISCHER. To heat uniformly large objects on a commercial scale, resistance wires are arranged in the interior of a furnace in contact with an atmosphere of hydrogen, in which also the objects to be heated are placed. Three figures.

24,017/13. *Rotary Printing Press Drive*. SIEMENS-SCHUCKERTWERKE-GES. The drive from auxiliary to main motors is through a flexible belt and spur gearing so arranged that the auxiliary motor is protected from shock, when the teeth of the clutch come into contact, by the slip of the belt. The arrangement is also of use for paper-calendering machines. One figure.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

*Arc Lamps*: B.T.-H. Co. (*G.E. Co., U.S.A.*) 10,304/13; RAILING and ANGOLD, 14,071/13.

*Distributing Systems, Cables and Wires, Insulating Materials, &c.*: DORMER [Protection of D.C. instruments from stray currents] 6,900/13.

*Dynamos, Motors, and Transformers*: B.T.-H. Co., CLOUGH and DUNKER, 7,600/13; SIEMENS DYNAMO WORKS, KOETGEN and KIEFFER [Anchoring windings] 15,148/13; GOLDSCHMIDT [High-speed rotors for H.F. multipolar machines] 17,268/13; HARTMANN [Packing joints of A.C. metal vapour rectifiers] 20,300/13.

*Instruments and Meters*: B.T.-H. Co. and HOLDEN [Indicating appliances] 12,839/13; LUNDGREN [Connections for tariff meters] 15,086/13; KORTING & MATHIESON A.-G. [Meters] 27,875/13.

*Storage Batteries*: DYMOND (*Marquise des Ligneris*) 15,327/13. *Switchgear, Fuses, and Fittings*: WADE (*Schneider & Navjoks Elektrizitäts Ges.*) [Lamp fittings] 7,244/13 and 7,246/13; WILKINSON [Lamp-holders] 10,004/13; THOMPSON and BOWDEN [Time switches] 11,057/13; MARKT [Ceiling roses] 11,755/13; DAY [Fixing shades, &c., to lamp-holders] 12,404/13; HULBERT [Dimming switch] 13,023/13; VALE and BEST [Lighting fittings] 13,249/13; LE COMPTE and HODGSON [Lamp-sockets] 19,916/13; WATSON and VERITYS [Candle lamps] 25,586/13; DEHLER [Pendants] 25,666/13; BÉRAUD [Time switches] 945/14.

*Telephony and Telegraphy*: CHAMBERS [Receivers for wireless] 4,779/13; BRITISH L. M. ERICSSON MFG. Co. and ROGERS [Switches] 6,873/13; GOOD and REBESL Co. [Automatic Morse-recorder] 6,887/13; GRAHAM & LATHAM Co. and SOBOTKA

[Tuning coils] 7,396/13; [Detectors for wireless] 7,977/13; MARCONI and FRANKLIN [Transmitters for wireless] 7,610/13; SIEMENS BROS. and CHRISTIAN [Telephone observation circuits] 9,166/13; HADDAN (*Reineke*) [Mine signalling and telephony] 25,975/13.

*Traction*: BOWEN and CEDES Elec. TRAC. Co. [Overhead lines] 7,305/13.

*Miscellaneous*: B.T.-H. Co. (*G.E. Co., U.S.A.*) [Treating metals] 9,097/13; GYURIS and ALOIS SCHLESINGER [Direct conversion of heat into electricity] 10,036/13; HEINS [Substitution resistances] 10,252/13; EVERSHED & VIGNOLES, KILBOY and NEEDHAM [Automatic timing for stoking of boiler furnaces] 13,228/13; RATEAU [Firing submarine mines] 16,438/13; RAJCZY [Water-gauges] 16,691/13; WHITEHEAD & Co. [Steering torpedoes] 18,859/13; SENFTLEBEN [Submarine mines] 23,504/13; DE LA RIBOISIÈRE [Working door-sashes of automobiles, &c.] 26,060/13; J. ZARUBA & Co. [Primary batteries] 28,734/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

*Distributing Systems, Cables and Wires, Insulating Materials, &c.*: ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEVOIX SOC. ANON. [Starting synchronous and asynchronous machines connected in cascade] 15,875/13; CREIGHTON [Protective devices for distributing systems] 5,542/14; KETTERING [Selective distributing system] 7,465/14.

*Ignition*: UNTERBERG and HELMLE, 13,006/13; HANS, 6,992/14. *Switchgear, Fuses, and Fittings*: PARIS [Electromagnetic switches] 6,425/14.

*Telephony and Telegraphy*: DE BERNOCHI [Working type printing machine by wireless] 3,371/14; MARTIN [Telephony] 6,659/14.

*Traction*: SIEMENS-SCHUCKERTWERKE GES. [Suspension and tension of contact lines] 4,523/14; YSEBOODT [Block signalling] 6,494/14.

*Miscellaneous*: BECKMANN [Magnetic tachometers] 3,020/14; DEAN [Hooters] 5,346/14; WATERS [Route indicating lamps for vehicles] 7,090/14.

The following Amended Specification may now be obtained:—

Telephony: E. A. GRAHAM and W. J. RICKETS, 2,610/13.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

7,108 of April 17th, 1900. *Ignition Magnetos*. F. R. SIMMS and R. BOSCH. The armature is continuously revolved by being fixed to a plate on the engine shaft or on a countershaft driven from the engine shaft. Where the current is generated by the rotation of an envelope the armature is fixed to one end plate and the envelope to another, driven as before.

7,272 of April 19th, 1900. *Electrolysis*. H. BAKER. Rigid contact plates are clamped to carbon electrodes used in electrolytic processes, so that a permanent reliable contact is obtained.

7,284 of April 19th, 1900. *Sirens*. W. MAY and PULSOMETER ENGRG. Co. A steam siren is arranged to be controlled by a valve worked by hand or electromagnetically.

The following are the more important Patents that have become void through non-payment of renewal fees.

*Arc Lamps*: C. SMART [Suspension] 27,180/05.

*Distributing Systems, Cables and Wires, Insulating Materials, &c.*: R. LUNDELL [A.C. commutator motor speed control] 26,808/05; H. LEITNER [Battery-dynamo train lighting system] 29,758/06; O. C. IMMISCH [Re-manufacture of old or waste ebonite and vulcanite] 28,365/07.

*Dynamos, Motors, and Transformers*: VERITYS and D. E. ROGERS [Adjustable box-type carbon brush-holders] 28,336/04.

*Electrochemistry and Electrometallurgy*: A. VOELKER [Glass-making resistance furnace] 28,276/08.

*Instruments and Meters*: W. B. THORPE [Differential electromagnetic registering mechanism, also applicable to the control of switches, recorders, &c.] 28,561/08.

*Telephony and Telegraphy*: F. RITCHIE [Relay in which a first small movement of the armature is reinforced by a local current. This relay may be used for pen lifting in the telewriter, &c.] 28,255/04; A. MUIRHEAD [Duplex submarine telegraphy] 27,867/08.

*Miscellaneous*: L. I. BLAKE and L. N. MORSCHER [Electrostatic separator for precious metals] 23,878/00; V. G. MIDDLETON (*A. J. East, Bermudas*) [Remote indication of liquid levels] 28,973/04; W. H. COON [Massage apparatus] 26,878/05; A. P. STECKEL [Brake and clutch] 28,130/08; W. D. and F. G. BOWMAN [Time recorder for use in certain cases during working hours] 28,228/08; S. BENKÖ [Primary batteries] 28,290/08; R. B. MATTHEWS [Friction-driven gearing for electro-motors adapted for domestic use] 28,420/08.

## THE B.E.A.M.A. AND THE HOME OFFICE REGULATIONS

IN view of certain difficulties which had arisen regarding the interpretation of the Electricity Regulations of the Home Office under the Factory Acts, a sub-committee of the Switchgear Section of the British Electrical and Allied Manufacturers' Association recently discussed the questions involved with Mr. G. S. Ram (H.M. Electrical Inspector of Factories), and as a result all the questions of interpretation have been set at rest, and Mr. Ram's replies are to be embodied in the next edition of his memorandum on the Regulations.

The first question was whether armouring or protecting cables interconnecting two E.H.T. switchboards in a station is required under Regulation 2, and Mr. Ram points out that this is advisable, and further adds that unarmoured cables when in trenches or on switchboards should be separated by fire-resisting divisions. In reply to another question relating to Regulation 5, the use of main fuses behind panels of low and medium pressure switchboards is stated to be undesirable in view of their possible effect under short-circuit conditions upon neighbouring conductors. Instrument fuses on the back of the board should be of the enclosed or cartridge type, and unless protected by a switch should be constructed so that they can be handled without danger of touching the live parts. A question also arose under Regulation 15 as to the interpretation of the expression "set apart for the purposes thereof," in connection with switchgear, which defines the area within which switchboards must be fenced. This is now declared not to apply to isolated auxiliary boards, such as those near rotary converters, in a boiler-house, &c., and it is required that these be fenced if they are placed where people are liable to pass close to them for purposes other than attendance thereon. In reply to a question whether boards of not more than two panels may be placed close to a wall without a passage-way, but so that they can be inspected from either side, Mr. Ram considers the practice undesirable for boards that cannot be made dead, except where all connections and parts which may require attention are at the front. Referring also to Regulation 17, it is considered desirable that the passage-way behind E.H.T. boards should provide a means of exit at either end, especially in large power stations. In stations of moderate power, however, where the passage-way is two or three times the minimum width, a second means of access may be unnecessary. In another reply on the subject of protection of switchgear cells by screens or doors it is recommended that lift off screens be made of non-metallic material, such as asbestos plate. Hinged doors should open 180°, and there should be at least 15 inches space between the edge of the door when open 90°, and the opposite wall of the passage. Where necessary to provide this clearance, double doors, hinged on either side, may be used. Sliding doors may conveniently be arranged on two lines of runners, and should be hung alternately on the front and back runners, so that any door may be opened without having to move others. Doors of expanded metal are approved of. Even in locked enclosures, where only authorised persons have access, permanent cell doors are preferable to the use of removable screens. It is further recommended that isolating switches be installed in separate compartments from the apparatus which they isolate, but where temporary screens must be used on existing boards for screening off the live side of the isolating switches, safe means should be provided for their insertion by the provision of suitable guides. Another subject taken up was in what circumstances are barriers required between adjacent phases, to which the reply was that divisions were desirable between phases at all places where an arc was liable to be started accidentally, such as at isolating switches. It was recommended that isolating switches be placed on both sides of oil switches on feeder circuits, where the feeders are capable of being made live from the distant end. Potential transformers with attached fuses should be protected by isolating switches in a separate compartment. This last point arose chiefly from Regulation 5, and another question under the same regulation was whether combined traction and three-wire supply boards, with the traction negative and supply middle wire earthed, and more than 650 volts between the traction position, and one of the supply outers, are to be regarded as high pressure switchboards. As the two systems in such a case are quite distinct it was replied that the high-tension regulations do not apply.

## ANNUAL PATENTS REPORT

The thirty-first report of the Controller-General of Patents for the year 1913 is now available. Among the subjects of an electrical nature in which "inventors have shown special interest" are the construction of small dynamos for lighting automobiles and for starting the engine, and railway signalling. More than treble the number of applications for patents for the latter were made in 1913 compared with 1912. These related mainly to automatic signalling and train-stops.

A number of inventions dealing with mine signalling were also received. The total number of applications from all sources was 80,077, compared with 80,089 in 1912. The total number of complete specifications received was 19,809, compared with 18,858 in 1912, an increase of 2.4 per cent. The proportion of complete to provisional specifications filed on application continued to increase, and was nearly 53 per cent. in 1913, compared with 52 per cent. in 1912. Applications for patents by persons resident in the United Kingdom numbered 20,426 in 1913 and 20,174 in 1912, while the figures for Germany during these years were 8,167 and 8,169 respectively; for France, 1,148 and 1,097; and for the United States 2,646 and 2,986. The total number of applications under the International Convention was 8,673 in 1913, compared with 8,272 in 1912, being divided as follows:—Germany, 1,528 and 1,366; France, 669 and 602; United States, 635 and 644; Belgium, 203 and 155; Austria, 180 and 175. It is interesting to note that of the complete specifications filed in 1913, no less than 1,174 were reported as wholly anticipated, 10,903 as partly anticipated, and 5,330 as not anticipated. Of those anticipated, 11,008 were amended without a hearing, and 650 after a hearing and decision. There are now two patents of electrical interest prolonged beyond the customary fourteen years maximum life—Nos. 11,575/97, by Sir O. J. Lodge, relating to wireless, and 24,048/99, by F. Ritchie, relating to the telewriter.

## ELECTRIC TRACTION NOTES

A Board of Trade report by Col. Von Donop has been issued regarding a derailment of a tramcar at Manchester on Feb. 25th. The inspector attributes the accident to the excessive speed at which the driver allowed the car to enter the curve.

A Board of Trade report on a tramcar derailment in Dublin on February 1st has just been issued. The car was derailed on a curve about 45 yds. from facing points, electromagnetically controlled from the car. The Board of Trade regulations restrict the speed to 4 m.p.h. through facing points, and the Company's to 2 m.p.h. on curves, points, and crossings. The points are controlled by the "Tierney-Malone" controller. When the car is about 50 ft. away, its trolley makes contact with a metal ramp secured to the trolley wire, and if at that time the controller is set in one of the working positions, a solenoid in an iron box in the road is energised and shifts the points. The points are similarly restored to their normal position when the car has passed. Lt.-Col. P. G. Von Donop, who conducted the inquiry, concludes from the evidence that the points, for some reason which cannot be definitely ascertained, were not lying in their normal position for the straight-through road—this might have occurred by their having been maliciously moved, or by the driver not having his controller in the "off" position—and to the fact that the speed of the car was too high, probably 5 or 6 m.p.h., to allow of the driver's ascertaining their position, and stopping the car before running through, as well as to the sudden application of the Westinghouse magnetic track brake when running round the curve.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

There is now, says *Telephony* (Chicago), one telephone for every 15.2 persons in Canada, according to a statistical report issued by the comptroller of statistics in the railway dept. of Canada. There are 1,075 private, co-operative, or municipal telephone organisations. During the past year seventeen new municipal services, 129 co-operative services, 175 joint stock services, and thirty-two partnership services, were established. There are 1,092,587 miles of wire in use, with 463,671 telephones. Of these 269,843 are of the central-battery type, and 193,828 of the magneto type.

The Poulsen wireless stations in County Kerry and New Brunswick are nearing completion, and should be working in May. By a contract with the Canadian Government the minimum speed of transmission is to be 400 letters per minute.

The report of the American Marconi Co. for the period ending December 31st, 1913, shows that only 1.9 per cent. profit was earned on the share capital. No dividend is recom-

mended. Patents, patent rights and goodwill appear in the books as representing over 25 per cent. of the total assets. An arrangement has been made with the Western Union Telegraph Co. whereby messages will be sent between New York, San Francisco, Boston, &c., by the new wireless stations in New Jersey, California, and Massachusetts. Attention is drawn to the fact that efforts are being made to build up a railway business by the establishment of wireless equipment on trains.

The Union Government is considering the establishment of a wireless station at Springs, east of Johannesburg, to communicate with Nairobi and thence to Malta.

Work is to be commenced forthwith on the stations in the French Inter-Colonial wireless chain. The range of most of the stations is to be between 2,000 and 3,000 miles, and the principal stations will be at Timbuctoo, Bangui, Jibuti, Antananarivo (Madagascar), Pondicherry, Saigon, Noumea

(New Caledonia), Papeete, the Marquesas Islands, and Martinique.

MM. Ducretet and Roger have devised an apparatus for the automatic reception and recording of wireless signals. An electrolytic detector and an electro-magnetic relay control a Morse ink. It is said that messages from the Eiffel Tower can be recorded at distances up to 500 kilometres.

A wireless installation is being erected at the Wolf lighthouse for communication with the mainland. It is proposed also to erect one at the Longships lighthouse off Land's End.

A wireless station is to be erected near Stonehaven, Kincardineshire. This will be available for telegrams to the north if the main overhead lines are interrupted.

The Portuguese Colonial Minister states that the line from Santo Antonio do Zaire Noqui is down, and that telegrams for Jala and Noque, Portuguese Angola, and the Belgian Congo are being sent *via* Libreville during this interruption.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 221. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**FLAME ARC LAMPS.**—The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), has issued a supplementary bulletin dealing with the recent improvements which have been made in "Angold" magazine flame arc lamps for alternating-current circuits. As these lamps only work in parallel no substitution resistance is required, and the mechanism has no shunt coil, as an internal autotransformer is fitted, thus maintaining a constant pressure across the arc and keeping each lamp as a complete unit. Several improvements in details of construction have been made. The mean lower hemispherical candle-power for the 8-ampere lamp is 1,150, for the 10-ampere lamp 1,524, and for the 12-ampere lamp 2,040. Burning hours vary from 65 to 80, according to the type used.

**DRY BATTERIES.**—The Battery Department of the General Electric Co., Ltd., has just published a leaflet dealing with "Witton" dry batteries and others. The former is set up for 4½ volts, and is very convenient for bell work, &c.

**"GEEKO" COMPANION SET.**—A further leaflet from the Novelties Department of the General Electric Co., Ltd., calls attention to the neat "Geeko" companion set, which may be used as a bell, hand-lamp, night-light, or alarm clock.

**AUTOMOBILE LAMPS.**—The British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), have issued a new folder giving particulars of their well-known Mazda drawn-wire lamps for lighting automobiles. The list, which is well arranged, deals with lamps for headlights, side-lights, tail and dash lights, and steering pillar lights, as well as in the festoon, dome, and tubular forms for car interior lighting.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**AIR FILTERS.**—We are in receipt of a Dry Air Filter Catalogue from Balcke & Co., Ltd. (Broadway Court, Broadway, Westminster, S.W.). The publication, which is illustrated, deals with the construction and uses of the company's patent dry-air filters for dynamo-electric machinery. We are informed that the company has supplied to date dry-air filters aggregating a capacity of 79,357,200 cub. ft. of air per hour, including two plants, each dealing with 7,500,000 cub. ft. of air per hour.

**WIRING ACCESSORIES.**—The British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), have just issued a price list of wiring accessories, which are now being offered at reduced prices. Samples can be seen at Mazda House. They embrace standard accessories, shades, and reflectors, fittings and parts, bell materials, odd pieces of wires and cables, as well as miscellaneous accessories, including telegraph insulators, screws, asbestos string, &c.

**TELEPHONE ARM.**—A publication of the Sterling Telephone & Electric Co., Ltd. (210-212 Tottenham Court Road, W.), deals with the Equipoise telephone arm for office use. The construction is simple and gives a strong article, which is self-balancing and is readily fixed to woodwork in any position, the telephone

itself being kept clear of desk or table. The finish is in dull black and nickel-plate. Accessory extensions to meet difficult positions can be obtained at a small additional cost.

**"THE BRUSH BUDGET."**—The March issue of this illustrated periodical of the Brush Electrical Engineering Co. (Loughborough) contains, among other matters, illustrations showing the form of blading used in the Ljungstrom turbine and some new cars recently supplied to the Baker Street and Waterloo Railway.

**VENTILATION.**—A new catalogue from Ozonair, Ltd. (96 Victoria Street, S.W.), contains particulars of a considerable range of ozone-producing apparatus, and fans for use in various circumstances.

**TECHNICAL BOOKS.**—A second supplementary catalogue has been issued by Lewis's Medical & Scientific Circulating Library (136 Gower Street, W.C.). The publication includes a classified index of subjects with the names of the authors who have treated upon them. There are a number of books dealing with engineering subjects.

**AN OSRAM BLOTTER.**—The Osram Lamp Department of the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), is sending out a 24-page blotting book. On each right-hand page is a caricature of the properties of Osram lamps, and some notes addressed to those who are interested in their sale. The Company is pleased to forward one of these blotters to any applicant in the trade who cares to have one.

### LIGHTING OF WEAVING SHEDS

MANY textile manufacturers who have not yet converted their plant to electric drive nevertheless desire to lay down an electrical installation for lighting their mills. The

GENERATOR DRIVEN FROM SHAFTING OF A STEAM-DRIVEN MILL USED FOR LIGHTING.

advantages over gas for such work are undeniable, and it is found that electricity can show a considerable economy.

For the electric lighting installation three alternative schemes are open:—Electricity may be bought from the local power-supply company or municipality; a small steam set may be laid down, supplied with steam from the main boilers; or a generator may be driven from the main mill engine. The first scheme is usually ruled out by the high cost of current for lighting purposes only, seldom less than 8d. per kw.-hour. An examination of the relative costs shows that either of the two latter methods are to be preferred, the only advantage which can be urged in favour of the first being that the service from the power supply company is rather more reliable than from the mill engine itself. The choice, then, really lies between the two alternatives, of which, on investigation, the second is to be preferred, since the power required for electric lighting is usually negligible compared with the capacity of the mill engine, and it is introducing unnecessary complications to lay down a special steam set for electric lighting. A typical example of a textile mill illuminated on these lines is afforded by the Leigh Manufacturing Co.'s sheds, where the third scheme has recently been successfully carried out by Mr. R. S. Greenhalgh, Consulting Engineer, of Atherton. As will be seen from the accompanying illustration, a 30-kw. "Witton" generator supplying power at 220 volts is driven through a Hans Renold silent chain from the main shaft of the mill engine, and is situated in the engine-house. In the illustration a view of the generator is given, with cover removed from the gear-case. So successful has the installation been that the electricity is being generated at a cost of 0'6d. per unit, including interest and depreciation. The generator and the switchboard for this installation were supplied by the General Electric Co., Ltd., of Victoria Bridge, Manchester, Witton, and 67 Queen Victoria Street, E.C.

### A LARGE CABLE CONTRACT

THE contract for supplying and laying the whole of the cables in connection with the conversion to electric traction of the Buenos Ayres Western Railway Suburban System has been secured by W. T. Henley's Telegraph Works Co., Ltd., which firm, it will be remembered, also secured a similar contract in connection with the electrification of the suburban lines of the Central Argentine Railway, the cables for this latter undertaking being now in course of installation. The Buenos Ayres Western Railway system will be worked at a line-pressure of 800 volts direct-current. Energy will be generated at 2,500 volts 25 cycles, transformed to 20,000 volts by step-up transformers, and transmitted to five sub-stations equipped with rotary-converters. The feeders to two sub-stations will be run in duplicate. The principal cable item is one of approximately 116,000 metres of 10 sq. in. three-core, split-conductor, paper-insulated, lead-covered, and steel-wire armoured cable, which is to be used for feeders at the working pressure of 20,000 volts. This cable will be tested after twenty-four hours' immersion in water up to 50,000 volts, and a sample piece cut from any drum selected by the Consulting Engineers is to withstand a test pressure of 100,000 volts. It will be laid direct in the ground at a depth of 1 metre, further protection from mechanical damage being afforded by 2-in. creosoted boards being placed over the cables. At cross culverts and level crossings the cables will be drawn through cast-iron pipes, and where they run across bridges they will be hung on racks and protected from the sun's rays by sheet-iron. All joints will be of the vacuum type in gunmetal sleeves similar to those adopted for the Central Argentine Railway cable. The track cable consists of about 17,000 metres of single-core, paper-insulated cable, part of which will be lead-covered and single-wire armoured, and part sheathed with vulcanised bitumen, taped, braided, and laid solid in fibre troughing. This track cable will, of course, feed the conductor rails and connect across breaks in the rails at level crossings, junctions, &c. The contract also includes the supplying and laying of about 58,000 metres of dry core, lead-covered, and wire-armoured telephone cable with the necessary terminal boxes, pillars, telephone apparatus, and accessories, of which a very large quantity will be wanted. We understand that this is the largest contract ever placed for a power cable installation, and following as it does in the wake of the Central Argentine Railway contract secured by the same firm, which at the time it was placed was a record contract, enables Henley's to beat their own record. Moreover, the portion of the work that has been put in hand by the Railway Co. represents a part only of the complete scheme. If the Railway Co. eventually decide to carry out the complete scheme, the value of the

contract will be very considerably increased. The work is to be completed in sixteen months, and it will call for the services of a large number of engineers, joiners, &c. Messrs. Livesey, Son & Henderson and Messrs. Merz and McLellan are the Consulting Engineers for the complete scheme.

### UNDERGROUND STATION LIGHTING

THROUGH the courtesy of the General Electric Co., Ltd., who are in turn indebted to the Underground Railways for permission to take photographs, we are able to reproduce some illustrations of the reconstructed Charing Cross station of the Underground Railways, which now forms a connecting-

FIG. 1.—CORRIDOR CONNECTING HAMPSTEAD AND BAKERLOO LINES, CHARING CROSS.

link between the District, Bakerloo, and Hampstead lines, since the completion of the extension of the last-mentioned. This piece of line has been in process of construction since the latter part of 1911, and is about half a mile in length, running from the original terminus of the Hampstead Railway at Charing Cross, underneath the length of Villiers Street, and then loops round to a new single-platform station constructed about 50 yds. to the east of the Bakerloo line. The figures show the corridor connecting the Bakerloo and Hamp-

FIG. 2.—TOP OF ESCALATOR, CHARING CROSS.

stead lines, and the top of the escalator at Charing Cross, by which passengers descend from the District line to the Bakerloo or Hampstead lines, or *vice versa*. These illustrations were taken solely by the light of the ordinary installation. In the case of the corridor the illumination is effected by means of Osram drawn-wire lamps enclosed in G.E.C. "Superlux" globes, and in the case of the booking hall at the top of the escalator the illumination is again effected by Osram lamps in "Superlux" bowls. A remarkably even distribution of illumination is obtained.

### REFLECTORS FOR HALF-WATT LAMPS

WE are in receipt of an advance copy of a sectional list, dealing with Benjamin steel reflectors and Goliath lamp-holders for half-watt lamps, from the Benjamin Electric, Ltd. (1A Rosebery Avenue, E.C.). This extension of the Benjamin steel line of reflectors is particularly designed for

FIG. 1.—INTENSIVE STEEL  
REFLECTOR FOR HALF-WATT  
LAMPS.

FIG. 2.—PORCELAIN GOLIATH  
SCREW LAMP-HOLDER, WITH  
CONCEALED TERMINALS, FOR  
HALF-WATT LAMPS.

use in factories and similar interior lighting. The porcelain Goliath lamp-holders are able to carry 15 amperes at 100 volts, and can be supplied with either open or concealed terminals, with various flanges, and the well-known lamp-grip feature. We illustrate the intensive type of steel reflector and the neat Goliath holder with concealed terminals.

**Crystal Palace School of Practical Engineering.**—Particulars of the engineering course, which commences on April 29th, can now be obtained on application to the Registrar, School of Engineering, Crystal Palace, S.E.

### ELECTRIC GRIDDLE PLATES

AMONGST the several new items on the "Plexsim" system, being placed on the market by the electric Heating and Cooking Department of Simplex Conduits, Ltd., attention may be drawn to a range of griddle plates, such as the one illustrated here. They are rectangular in shape, finished in black, with a planed metal top; a useful size for

PLEXSIM ELECTRIC GRIDDLE PLATE.

the house, being 16 in. long by 8 in. wide, taking 1,000 watts. Temperature regulation is provided for by three pin terminals. Marble connectors are used, and the plates are supported on insulating feet. The largest size is 24 in. by 12 in., taking 2,500 watts at full load, and prices will be quoted for special sizes on request. The neat appearance of this apparatus is seen in the illustration, which represents a medium-sized plate.

**Magnetite Arc Lamps.**—It is stated in the *General Electric Review* (Schnectady), that during the past few years much research work has been done in the direction of increasing the efficiency of magnetite arc lamps. Two lines of investigation have been followed, bearing on the production of electrodes to support an arc at a higher efficiency than that of present lamps: (1) Utilising standard lamps, and (2) without regard to this condition. It is anticipated that both lines of research have been successful, and that electrodes will shortly be on the market, giving an efficiency of about 0.5 watts per c.p. Higher efficiencies are regarded as possible with a modified lamp mechanism. Although such efficiencies as 0.2 to 0.25 watt per mean hemispherical c.p. are not immediately available commercially, they may be regarded as reasonably sure of attainment in a short time.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Blackrock.**—The Council invites tenders for two (Diesel engines) generating sets, booster, battery, switchboard, &c. Consulting Engineer, J. P. Tierney, 15 College Green, Dublin. April 28rd.

**Braintree.**—An electric lighting scheme has been placed before the Council by Mr. H. P. Girling, consulting engineer, of Maldon. Alternative schemes costing between £9,000 and £14,000 have been prepared.

**Burton-on-Trent.**—An expenditure of £7,000 is contemplated on the electricity undertaking.

**Oriccieth.**—An electric lighting scheme is under consideration.

**Malvern.**—The Council has decided not to negotiate with the Worcester Corporation for a supply in bulk, but to apply to the L.G.B. for a loan of £1,500 with a view to installing a 150-kw. set.

**Manchester.**—One 5,000-kw. turbo-alternator with pipework, pumps and condensing plant. Chief Electrical Engineer. May 18th.

**New Zealand.**—According to the *Board of Trade Journal*, new generating plant is required by the Wallington, Dunedin, and Hastings Councils.

**Ruthin.**—An electric lighting order has been granted for this district.

**Torquay.**—Additional steam-raising plant is to be installed immediately. Mr. C. W. Salt, the Electrical Engineer reporting upon the extensions for 1915-16, says that the best plan would be to erect an entirely new works, but as this would entail an outlay of some £35,000 he does not think the financial results would justify it. Therefore, it is recommended that extensions be carried out on the present site at an expenditure of some £16,000.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Bacup.**—New municipal offices.

**Bradford.**—New hall, Morley Street. City Architect. April 28rd.

**Caerphilly.**—New police station. Clerk, County Council, Cardiff.

**Dundee.**—New city hall.

**Eccles.**—New municipal offices.

**London: Marylebone.**—Block of flats, 8 to 12 Manchester Street. Architect, H. J. Colebrooke.

**Reading.**—New factory (£55,000). Co-operative Wholesale Society, Manchester.

**Skegness.**—Cinematograph theatre. Architect, F. A. Tugwell.

**Stockport.**—New school.

### Miscellaneous

**Bacup.**—An important scheme for street lighting by metal-filament lamps has been adopted by the Council.

**Bulgaria.**—A telephone service is to be established between Sofia and Constantinople.

**Malton (Yorks).**—Tenders are invited for the lighting of this district for three years. Surveyor, Town Hall.

**Mexborough.**—The preliminary arrangements for the construction of the two railless traction routes, sanctioned last year, are in hand.

**Power Press Guards.**—Veritys, Ltd. (Plume & Victoria Works, Aston, Birmingham), send us some particulars of a new guard for power presses which, in view of the activity of the factory inspectors in enforcing the regulations as to the proper protection of such machinery, should find considerable application. The front of this is in the form of a gate which swings open when the press is at the top of its stroke, but closes when it begins to descend, so that a complete cage is formed round the tools. The construction is very simple, and the method by which it is opened and closed is very ingenious.

## TENDERS RECEIVED AND ACCEPTED

**Belfast.**—The General Electric Co. has received the annual contract for electrical accessories for the Tramways Department.

**Farnworth.**—A contract for new generating plant has been placed with the British Westinghouse Co.

**London: St. Pancras.**—The following tenders are recommended for acceptance:—The Sloan Electrical Co., 65,000 pairs of 10-in. open-type carbons, and 140,000 pairs of 12-in. open-type carbons, at £669 17s. 6d.; General Electric Co., 50,000 pairs of flame-arc carbons for the "Angold" lamps, at £216 5s.; Siemens Bros. & Co., 1,600 pairs of flame-arc carbons for the "Beacon" lamps, at £18 6s.

**South Africa.**—The General Electric Co. has received a contract for the whole of the plant and equipment for the municipal electric lighting scheme of Ermelo.

Messrs. Chamberlain & Hookham have received contracts for meters for the ensuing year at West Hartlepool, Pembroke, Halifax, Barrow, Mansfield, Newport, and Belfast.

## APPOINTMENTS AND PERSONAL NOTES

Mr. Ashton Bremner has severed his connection with the Hydro Electric Co. of Tasmania, and has been appointed Chief Engineer of the Marine Board of Mersey, Devonport, Tasmania.

Mr. Oliver Henry Kennedy, of the Marine Department, Messrs. Siemens Bros. Dynamo Works, Ltd. (66 Waterloo Street, Glasgow), was presented by the members of the Glasgow office staff with a silver tea set, on the occasion of his approaching marriage to Miss J. T. Muir, of Wimbledon.

Mr. A. E. Wray, Assistant Manager of the South Metropolitan Electric Tramways & Lighting Co., has been presented with a clock and an illuminated address on the occasion of his leaving to take up the appointment of Manager and Engineer to the Gravesend and Northfleet Tramways Co.

An engineer and manager is required by the Clones Electric Light & Power Co.

Shift engineer required for electric power station in South Europe. (See advertisement on another page.)

A locomotive draughtsman is required, with experience of electric locomotive work. (See advertisement on another page.)

A switchboard attendant is required for L.C.C. tramway sub-stations. (See advertisement on another page.)

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Brush Electrical Engineering Co.**—A substantial improvement is shown for the year 1913, there being a net profit of £20,061 14s. after providing for debenture interest. This result is due primarily to more satisfactory prices having ruled. It is recommended that the sum of £12,351 17s. be provided for depreciation in respect of the last two years, and the balance in reduction of the amount standing to the debit of profit and loss account.

**General Electric Co.**—The recent issue of new capital was largely oversubscribed.

**South Wales Electrical Power Distribution Co.**—The report and accounts for 1913 show a surplus of £2,915 after meeting depreciation. The sum on hand now amounts to £10,379 towards meeting indebtedness to certain consumers of the Treforest Co., amounting to £13,500. The Company is applying to the Board of Trade for a number of provisional orders in the South Wales area.

**Babcock & Wilcox.**—The net profit for 1913 amounted to £446,073. An interim dividend has already been paid on the ordinary shares, and a final dividend of 9 per cent. for the second half year is now recommended. After placing £50,000 to reserve fund and £10,000 to staff pension fund, a balance of £73,834 is carried forward. The business continues to progress, and the orders in hand on January 1st this year were in excess of those carried over at the 1st of January, 1913.

## LOCAL NOTES

**Accrington: Span-Wire Lighting.**—The Council is abandoning the use of the span-wire system of lighting in main roads, and is putting lamps on tramway standards.

**Bromley: Electric Cooking.**—At the annual meeting of the Bromley (Kent) Electric Lighting & Power Co. last week, special reference was made to the progress in the district in the use of electricity for heating and cooking, the charge for which is now 1½d. per unit.

**Copenhagen: Power Supply.**—It is stated that the agreement between the South Swedish Power Co. and the North Zealand Electric Works for conveying some 15,000 h.p. of electric current from Lagan, in Sweden, by means of a submarine cable, for lighting North Zealand, has been sanctioned by both the Swedish and Danish Governments. The distance across the Sound is 7 kilometres.

**Dartford: Electricity Undertaking.**—There has been considerable criticism recently of the management of the electricity undertaking, particularly in regard to one or two large power contracts which the Engineer recommended the Council to enter into. Consequently, Mr. J. F. C. Snell was called in to report upon the general position of the undertaking, which has shown a diminishing profit during the past few years. Mr. Snell reports that the Electricity Department is very carefully and ably managed by Mr. Pember who, he adds, deserves the full confidence of his Committee and the Council. All that is wanted is expansion of business, and then the department cannot fail to be financially successful. It is for this reason that the Council is recommended to proceed with certain large power contracts on the basis of £4 5s. per kw. plus 6½d. per unit, the energy being metered three-phase high-tension. These works, which are at Crayford, would involve the installation of a 500-kw. turbo-alternator with 10,000 volts transmission. Mr. Snell recommends that the periods for the proposed contracts should not be less than seven years, and also that there should be a coal clause in them.

**Ellon: Electric Lighting.**—The Council has instructed Messrs. T. C. Smith & Co. to proceed with the electric lighting scheme recently discussed.

**Farnworth: Electricity Progress.**—In order to meet the increasing demands on its electricity undertaking, the Council is extending the agreement with the Lancashire Electric Power Co. in order to obtain a further supply of current.

**London: Marylebone.**—The Electricity Department is offering to supply electric irons, toasters, or kettles, the method of payment for same being to add 5s. to the electricity account each quarter until the amount is paid off. No charge is to be made for interest on amount outstanding. This is a somewhat new departure, and is the result of a suggestion from a "live" man in the department.

**Lytham: Electric Supply.**—The Council is still undecided whether to instal its own generating plant or to have a supply in bulk from the St. Anne's-on-Sea Council. A short time ago an offer from St. Anne's was refused, but more favourable terms have now been offered.

**Redditch: Electricity Undertaking.**—Messrs. Hancock & Dykes, the Council's consulting engineers, have now reported upon the position of the electricity undertaking. They criticise the high coal consumption per unit sold, viz., 11'3 lb., and refer to the impossibility of opening any of the plant for internal inspection as there is no stand-by. With regard to mains, the high-tension cables are in a passable condition, but will not long continue to serve their purpose unless relief mains are laid. The sub-stations below the streets are badly arranged and immediate steps are required to ensure the safety of the workmen. If these sub-stations are retained the interiors should be practically rebuilt and rearranged. There are many opportunities for leakage on the distributors, and the lack of uniformity in the pattern of meters now in use does not conduce to efficient administration. A meter-testing department is recommended, as well as periodical tests of meters. Messrs. Hancock & Dykes do not recommend the Council to entertain the question of purchase, as they doubt if they would find a purchaser to pay more than the outstanding debt on the undertaking. The alternative of moving the existing works to another site is regarded as impracticable, and they recommend an outlay of £18,000 upon remodelling the existing plant and installing additional plant. In addition, they suggest that the charges for current for all purposes should be advanced by 12½ per cent., which would yield an average of 1'65d. as against the present 1'47d. Even with this advance the consulting engineers are

confident that electricity will be able, in Redditch, to compete with any other form of power.

**Saddleworth: Electric Supply.**—Negotiations have been carried on with the Stalybridge, Hyde, Mossley and Dukinfield Electricity Board for a supply of electricity in bulk.

**Scarborough: Purchase of Supply Co.**—Negotiations are now actually being carried on with regard to the purchase of the local electric supply company.

**Torpoint: Electric Lighting.**—The Council has entered into an agreement for an electric lighting installation to be started in the town by some private promoters.

**Turton: Lighting Small Houses.**—A scheme for lighting small houses at a charge of 7s. per quarter, irrespective of the amount of current used, is being developed.

**Wednesbury: "Free" Wiring.**—The Electricity Committee recommends that the "free" wiring of consumers' premises shall be discontinued. The Committee thinks it better to offer more attractive terms in other directions. It also recommends that the present system of supplying to small houses at an inclusive charge of 10d. per week during December and January, and on a sliding scale to 5d. per week in June and July, be discontinued as regards new houses, and that the charge to the existing consumers on this system be increased to 1s. and 8d. respectively, all renewals being paid for by the consumer, these latter having hitherto been provided free by the Corporation.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £67 to £67 10s. (Last week, £67 15s. to £68.)

**Bankruptcies.**—The last day for receiving proofs in the bankruptcy of Charles Blake, trading as the Bilston Electrical Co., 4 Church Street, Bilston, is April 22nd. The trustee is Mr. S. W. Page, 80 Lichfield Street, Wolverhampton.

**Companies Struck off Register.**—The following have been struck off the register of joint stock companies:—Electricity Generating Co. and Ferabin Lamp & Electrical Accessories, Ltd.

**Liquidations.**—The Electromotor Equipment Co., 59 to 65 Paul Street, E.C., is to be wound up voluntarily. The liquidator is O. Steiner, 21 Old Broad Street, E.C.

## NEW COMPANIES

**CARLETON ELECTRICAL CO.,** 569, Garratt Lane, Earlsfield, Surrey. Capital £20,000. To take over the electrical business of G. Inrig, L. Inrig, and Gavan Inrig, Ltd. Private company.

**E.M.F. (1914).**—Capital £3,000. To take over the business of E.M.F., Ltd., at London and Walsall. (Private company.)

**LOMBARD, ROGERS & CROOKS.**—Contractors for public and private works, including electric light, &c. Capital £2,000. Private company. Registered by Jordan & Sons.

**"Undue Preference" under Electric Lighting Acts.**—An important action has been heard by Mr. Justice Sargant in the Chancery Division last week, in which the Attorney-General, at the relation of the Long Eaton Gas Co., raised the question as to whether the Long Eaton Urban District Council is within its rights under the Electric Lighting Acts in charging preferential rates to users of electrical energy for power purposes. This matter has long been the subject of controversy in various parts of the country, but it has never been contested in a court of law before, and consequently considerable interest will attach to the judgment in this case, which has been reserved. As a matter of fact, there are only two or three large power contracts running in Long Eaton, the Council's power tariff being one under which power users taking a supply for power and lighting, and using electricity only, are granted special terms. The argument is that this tariff is intended to attract customers for electric lighting to the detriment of the Gas Co., and as such is a preference far beyond anything contemplated by Sections 19 and 20 of the Electric Lighting Act of 1882.

## SUMMARY

THE Building Trades' Employers' Association in the Manchester district have agreed with the Electrical Trades Union to certain working rules for wiremen; while placing no obstacle to their men joining the Union, the masters do not agree to employ Union men only.—The refusal of the Electrical Trades Union to accept this principle in London has still been standing in the way of negotiations for settling the wiremen's dispute there, but as the building trades unions are apparently giving way on this point, a settlement may shortly be expected. The number of London wiremen on strike is still very small. (Page 224.)

THE War Office brought an action against an architect and their consulting engineers for negligence in permitting lead-covered wire to be used under plaster in one of the War Office buildings. The case concluded on Tuesday. Judgment is reserved. (Page 224.)

ABOUT 12,000 h.p. in motors is connected to the 44,000 volt three-phase duplicate transmission line across the Isthmus of Panama for working and lighting the Canal locks. The line is fed from a hydro-electric station at Gatun, and there are transformer substations at Cristobal and Balboa, where the pressure is reduced to 2,200 volts. The pressure is further reduced to 240 volts in 36 substations in the lock-walls for working the motors. The movements of all machinery are reproduced on an interlocked control board at the locks. (Page 225.)

SOME tests by Mr. F. J. Teago on a 12 kva. 200

volt transformer show that by the use of air-blast cooling with "fogged" air a large decrease in the temperature rise results. (Page 226.)

THE adjustment of crane brakes of the flapper type is dealt with in our Questions and Answers columns. (Page 227.)

A DESCRIPTION of a method employed for the repair of a broken down armature is contained in a Paper recently read before the Association of Mining Electrical Engineers. (Page 227.)

A DESCRIPTION appears in our Electric Traction Notes of an electric mountain railway in Japan. The recent interruption in the working of the Great Northern & City Railway on Thursday was due to a feeder breakdown. (Page 228.)

AN important wireless telegraph patent action is to be heard in June. (Page 228.)

A SPECIAL switch and fuse box has been designed for single-phase induction motor circuits in which a larger fuse is in circuit when starting than when running. Our Trade Section also contains illustrations of railway station and restaurant lighting. (Page 229.)

LOANS of £25,000 and £3,000 are to be taken up at Ayr and Walsall; a 12,000 kw. turbo-alternator is required at Leeds; cables at Southwark and Belfast; electric lighting schemes are under consideration at Flint, Keith, Braintree, Guisborough, and Inverurie; four electric cranes are required at Cadiz. (Page 231.)

AFTER considerable negotiations, arrangements for a bulk supply have been made between the St. Anne's and Lytham Councils.—A site for a new power station has been selected at Edinburgh.—Considerable additions are to be made to the public electric lighting at Dover.—A supply of electricity is given for the first time in Macclesfield.

A NET profit of £8,782 is reported for 1913 by Willans & Robinson after meeting debenture interest.—The satisfactory position of the Brush Electrical Engineering Co. was commented upon at the annual meeting on Monday, as was also the fact that the Ljungstrom turbine supplied to the North Metropolitan Electric Power Supply Co. has been taken over.—A satisfactory year is also reported by Johnson & Phillips. (Page 232.)

THE "four sevens" Marconi Patent expires during the current week.—A Patent by S. G. Brown relating to quadruplex submarine telegraphy also expires after a full life.—Opposition to the Grant of a Patent to the British Thomson-Houston Co. for tungsten suitable for drawing into filaments is opposed by Brinsdown Lamp Works. The Patent for spiders for tungsten incandescent lamps applied for by Wolfram Lampen A.-G. has been allowed by the Comptroller in spite of the opposition.—The specifications published by the Patent Office last week include two relating to wireless and two relating to dynamo design. (Page 233.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 23RD.

*Institution of Electrical Engineers.*

8 p.m. "Electrification of Railways as Affected by Traffic Considerations," by H. W. Firth.

FRIDAY, APRIL 24TH.

*Institution of Mechanical Engineers.*

8 p.m. "Application of Electric Driving to Existing Rolling Mills," by L. Rothera.

SATURDAY, APRIL 25TH.

*Association of Mining Electrical Engineers.*

5 p.m. Warwickshire and S. Staffs Branch. At Imperial Hotel, Birmingham. (1) "Notes on Fault Testing," by E. E. Beadmore. (2) "Some Hints for Colliery Electrical Plant," by J. A. Kerr.

6.30 p.m. S. Wales Branch. At Carlton Café, Queen Street, Cardiff. "Automatic Controllers for Mining Work and Some Hints for Colliery Electrical Plant," by J. A. Kerr.

MONDAY, APRIL 27TH.

*Institution of Electrical Engineers: Newcastle Students' Section.*

7.30 p.m. At Armstrong College. "Electric Ship Lighting," by B. S. Orme.

TUESDAY, APRIL 28TH.

*Royal Society of Arts.*

4.30 p.m. Colonial Section. "The Administration of Imperial Telegraphs," by Charles Bright.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. Annual General Meeting at the University, followed by lecture by Prof. J. A. Fleming, F.R.S.

*Institution of Civil Engineers.*

8 p.m. Annual General Meeting.

WEDNESDAY, APRIL 29TH.

*Electrical Contractors' Association.*

6.30 for 7 p.m. Annual dinner at Grand Hotel, Leicester.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. Annual meeting at Victoria Embankment, followed by discussion on "The Students' Section."

### The London Electrical Engineers.

Headquarters (46 Regency Street, S.W.) open Sats. till noon.  
Rating Exam. for all Cos. from 7 to 10 p.m. every Wednesday.  
(To-day) THURSDAY, APRIL 23RD, C. Co. FRIDAY, APRIL 24TH, D. Co.

## WIREMEN'S WAGES

NEGOTIATIONS between the Manchester, Salford & District Building Trades Employers' Association and the Electrical Trades Union for a revised code of working rules for wiremen and cable-jointers have resulted in an amicable settlement.

The most important of these rules, which have been mutually accepted, is as follows:—"Whilst agreeing not to place any obstacle in the way of men joining the Union, employers do not agree to employ Union men only."

The other rules are summarised below:—

The minimum rate of wages for qualified wiremen and cable-jointers is to be 9½d. an hour, which it may be mentioned is the rate which came into operation at the termination of the strike last November. The extra pay for charge-hands is to be mutually agreed in each instance. These wages are for a 52-hours week (9½ hours ordinary days and 4½ Saturdays); time and a quarter overtime for first two hours; time and a half for the second two hours, and then double time. Ordinary night gangs to be paid time and a quarter from 6 p.m. to 6 a.m.

Beyond a radius of one mile from the Manchester Town Hall, the following will be paid as travelling expenses: up to 2 miles, 3d. per day; 3 miles, 5d. per day; 4 miles, 8d. per day; 5 miles, 10d. per day, and time is to start on the job. At greater distances ordinary railway fares are allowed, and travelling time is paid each way. If required to lodge away from home 1s. 6d. a night is allowed, and return railway fares every fortnight within 20 miles; every month within 50 miles; and every three months over. Travelling outside ordinary hours for breakdowns, &c., is paid for at time and a quarter.

The number of apprentices is to be limited to one-third the average number of journeymen employed, averaged for the past three years.

Each qualified workman to have a full kit of tools, comprising cutting and gas pliers, heavy and light hammers, 2 gimlets, ratchet brace with 4 snail and 2 twist bits, 2 ft. rule, 4 firmer and 2 plugging chisels, tenon and key-hole saws, 2 lb. soldering iron, half-round file, 3 screwdrivers, 2 bradawls, square, plumb line, small plane, gouge, and small footprint.

Extra payment for "dirty work" to be as follows:—Cleaning out or repairing old accumulators, and work in oil vessels after carrying oil, 1s. per day; other ship repairs, mines and pits, 6d. per day; chemical works, accumulator works, paint works, riverside premises and docks, where conditions are abnormal, 6d. per day.

There is to be no strike or lock-out until any matter in dispute has been referred to a joint committee of employers and operatives who shall meet within six days; failing agreement, it shall be referred to an umpire, and wherever practicable, current conditions are to prevail in the meantime.

A qualified wireman and cable-jointer is defined as being over 21, and either having indentures of apprenticeship or references proving 5 years' employment in general electric contracting work; or alternatively, he must produce a certificate from some recognised authority.

No alteration is to be made in these rules without giving six months' notice, to expire on May 1st in any year.

There are still a few electrical wiremen out on strike in London, and there has been practically no change in the position during the past fortnight. The Union seems anxious to meet the masters to discuss the points of difference, but wish to eliminate from the discussion the so-called "Disability Clause," which they refuse to accept in principle. To this stipulation the masters will not agree; they regard it as an essential condition that Union men shall work amicably with any non-Union men who may be employed on the same job. In view of the probable settlement of the building dispute, and the acceptance by the building trades unions of the rule that trade unionists and non-union men shall work together as before, it appears likely that the wiremen will now abandon their attitude towards the disability clause, and the only outstanding point in dispute should now be as to the new grade of "pipe-fitters."

## LEAD-COVERED WIRE UNDER PLASTER

### Liability of Consulting Engineers

A CASE which has occupied several days in the King's Bench Court and terminated on Tuesday, has introduced two important questions, namely, the liability of consulting engineers for "negligence" if work has been done unsatisfactorily, and also whether it is desirable to bury lead-covered wire under plaster when wiring new buildings. The case in question is an action for negligence brought by the War Office against an architect, Mr. J. H. T. Woodd, and the consulting engineers, Messrs. Kirkland & Capper, for damages due to their alleged negligence in connection with the wiring of the Medical Staff College and Laboratories at Millbank, Westminster, in 1905.

It appears that the consulting engineers were instructed to follow a standard War Office specification, so far as this was applicable; a clause in this was to the effect that all conductors should be accessible to authorised persons, and another specified I.E.E. rules. The 1903 Code of Institution Rules was then in force, one of which specified that conductors buried in cement and plaster must be provided with protection of sufficient strength to resist a nail. For the walls of the building a material known as "Frazzi" slabs was employed, which is troublesome to chase, and only about ½ in. of plaster covered these blocks. After consultation with the architect, Messrs. Kirkland & Capper instructed the wiring contractors, Messrs. John Bolding & Sons, to employ twin lead-covered, rubber-insulated wire between the slabs and the plaster. A year or two after the job had been taken over, trouble was experienced, which the War Office experts allege to have been due to the wire having been damaged on rough corners of walls, &c., in laying, and also to electrolytic action due to the damp plaster; they pointed out also that the connection boxes for the wire were not watertight, and generally contend that the work was badly done, and in contravention of the War Office specification. The building, which included 879 points, was subsequently re-wired by another contractor.

For the defence it was alleged that the faults were due to rough work done by men of the Royal Engineers in executing repairs and extensions, that fuses had been replaced by copper wires, and it was suggested that there were faults in flexibles which caused over-heating of the buried conductors. Mr. Kirkland also maintained that accessibility to authorised persons in the War Office specification could be taken to apply to the ends of the conductors only, and that he considered it sufficient protection if he placed the conductors in positions where nails would not be likely to be driven in. Great care had been taken in putting in the wires and in testing. He had used lead-covered wire buried in plaster at Guy's Hospital since 1900, and there were now 30 miles of such wire there.

The Solicitor-General led the case for the War Office, and Mr. Shearman, K.C., and Mr. A. J. Walter, K.C., were leading counsel for the defence. Mr. Justice A. T. Lawrence has reserved judgment.

## ELECTRIC WORKING OF THE PANAMA CANAL LOCKS

SOME particulars are now available of the electrical equipment supplied by the American General Electric Co. for the working of the locks and for the lighting of the Panama Canal. The course of the canal, position of the locks and generating stations can be seen in the sketch map, Fig. 1. The main generating station is situated at Gatun, where there is a 7,500-kw. 2,200-volt three-phase hydro-electric plant. There is also a 4,500-kw. steam turbine plant at Miraflores, which was used to supply the electrical energy used during the construction of the canal, which can be used to give an emergency supply. The pressure is stepped up to 44,000 volts for transmission, and the lines, which are of seven strand copper, are run in duplicate across the Isthmus so as to connect the two generating stations with Cristobal and Balboa through four transformer substations. In addition, there are some thirty-six substations in the lock walls, transforming from 2,200 volts to 240 volts, and supplying Gatun, Pedro Miguel and Miraflores locks for power, traction, and lighting. The transmission line itself, which is in duplicate, is erected on steel side brackets fixed to steel lattice gantries spanning the railway track, so that when it is decided to electrify the railway the trolley wire can be suspended from these gantries, which have a solid concrete foundation, and are about 300 ft. apart. The lines are fixed 5 ft. apart horizontally, and 5 ft. 6 in. from the frame. Three-part porcelain suspension insulators, 10 in. in diameter, with fillings of Monel metal to

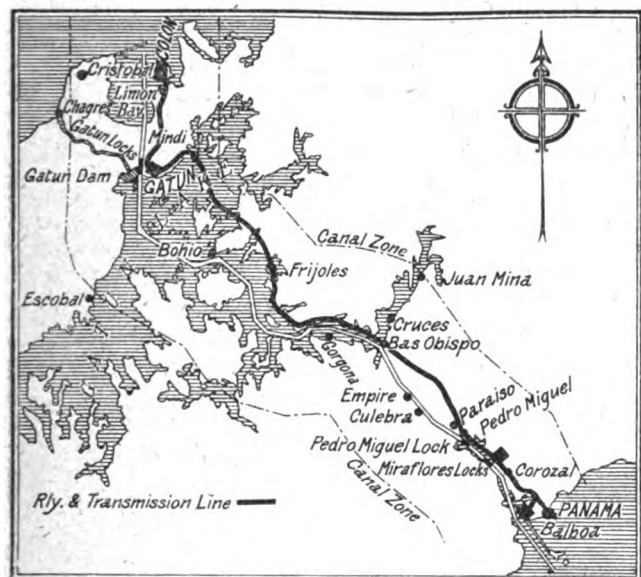

FIG. 1.—ROUTE OF RAILWAY AND TRANSMISSION LINES, SHOWING POSITION OF THE PANAMA CANAL LOCKS, GENERATING STATIONS, AND SUB-STATIONS.

resist corrosion due to the humid atmosphere, are used. At the top of each side frame is erected a continuous 5/16 in. copper-clad solid wire with amalgamated steel core. This wire is earthed at each of the 917 gantries. The total length of the transmission line is nearly forty-eight miles. About 4,000 suspension and 2,500 strain insulators are used. The scheme of connections necessitates throughout duplicate bus-bars and switches, so that any oil-switch can be disconnected for cleaning or repairs without interrupting its circuits. Each of the transformer substations contains duplicate 200-k.v.a. transformers and one single-phase 25-k.v.a. transformer, giving 220 and 110 volts for lighting. These substations are normally fed from the 2,200-volt bus-bars in the main 44,000/2,200-volt substations, but can also be run direct from the generating stations if necessary.

In the Gatun generating station and the four 44,000-2,200-volt substations, the oil-switches are controlled through solenoids, and are installed in concrete cells, above which are concrete fireproof compartments containing the two sets of bus-bars. In the thirty-six transformer stations in the lock walls, the oil-switches are worked by hand. All the 2,200-volt oil-switches (Fig. 2) have disconnecting switches, so arranged that live parts are completely covered. For the hand-worked switches a pipe framework supports vertical metal guides which carry the oil-switch mechanism and slate base, forming a section of the switchboard panel. On the guides a lever and

toggle mechanism is mounted, by which the oil-switch and slate base may be raised and lowered. Above the oil-switch, mounted on the pipe framework, a stationary cast-iron base carries the disconnecting switch-studs and insulators. The high-pressure leads run to the tops of the disconnecting switch-studs, and the bottom of each stud is equipped with contact fingers. On the top of each oil-switch stud is mounted a contact blade. When the oil-switch is raised, these blades engage the contacts on the bottom of the disconnecting switch-studs, which thus, in the closed position, form extensions of the oil-switch studs. The disconnecting switch contacts are surrounded by insulating shields, which prevent accidental contact. When the oil-switch is lowered, it is completely isolated from the circuit, and when raised, it always goes to

FIG. 2.—ARRANGEMENT OF OIL SWITCHES.

a fixed height, where it is latched. An interlock prevents it from being raised or lowered unless its contacts are open, precluding the circuit being closed or opened by the disconnecting switch. In some instances another interlock makes two single-throw switches a double-throw switch, and prevents both switches being closed at the same time. For the solenoid-operated switches, the same form of disconnecting switch is used; but the solenoid is stationary, and the connecting mechanism to the oil-switch has a vertical slotted link which allows the switch to be raised and lowered without being disconnected from the solenoid mechanism. A mechanical interlock prevents the raising or lowering of an oil-switch while in the closed position.

The size and disposition of the motors used for the control of the locks are shown by the following table:—

Machines	Motor Hp	Number of Motors				Total Hp
		Gatun	Pedro Miguel	Miraflores	Total	
Mitre gate, moving, each leaf ... ..	25	40	24	28	92	2,300
Mitre gate, mitre forcing	7	20	12	14	46	322
Fender chain, main pump ... ..	70	16	16	16	48	3,360
Fender chain, operating valve ... ..	0.5	16	16	16	48	24
Rising stem gate valve	40	56	24	36	116	4,640
Cylindrical valve ... ..	7	60	20	40	120	840
Guard valve ... ..	25	6	6	6	18	450
Auxiliary culvert valve	7	4	4	4	12	84
Totals ... ..	...	218	122	160	500	12,020

Most of the motors are controlled through contactor panels operated from the central control station. The smaller motors are started by being thrown direct on the line, while in the case of the larger motors a starting step, having resistance in two legs of the three-phase circuit, is provided. Local control is also provided for. The mitreing gates consist of two massive

leaves pivoted on the lock walls and working independently. In addition, at the lake and sea ends duplicate gates are provided. Also, intermediate mitreing gates divide each 1,000-ft. lock into two compartments, so that vessels of different sizes can be conveniently handled. When the mitreing gates are closed they are clamped by a "mitre-forcing" machine. For the control of the water-level there are three culverts fitted with rising stem valves. These valves are 8 ft. by 18 ft., and are installed in pairs, each pair in duplicate. Since the culvert in the middle wall has to serve the locks on both sides, cylindrical valves are placed in the lateral culverts at each lock. Where the guard gates are provided, two auxiliary valves are used to regulate the water to an intermediate height.

The indicators on the control boards (Fig. 3) are designed to show accurately and synchronously every movement. Both transmitter and receiver have a stationary and a rotating part. The stators have three-phase windings, and are connected together. The rotors have two poles, and are fed in parallel with 100-volt 25-cycle single-phase current. In the case of the mitreing gates the indicator is provided with a pair of small aluminium leaves. For the chain fender the indicator transmitter is driven by the limit switch shaft, and the indication at the board is given by a miniature aluminium chain with its ends fastened to semaphore arms. The indicators for the valves consist of aluminium cages. The under portion of each shaft is illuminated. The water-level indicators have an accuracy within 0.1 per cent. or 0.05 ft. of actual water-level. There are two sets of transmitters and receivers, one connected to a fine index in which the rotors make ten complete revolutions, and

FIG. 3.—CONTROL BOARD FOR MIRAFLORES LOCKS.

the other connected to a coarse index working through less than 180°. The fine index is a hollow cylinder carrying a pointer, the length of the cylinder being such that when the aluminium ball representing the coarse index is within the limits of the cylinder the reading of the fine index is correct within the limits specified. For water-level indication, wells 36 in. square, moulded in the lock walls, communicate with the locks by small openings which serve to damp any surges. Each well contains a welded-steel box float, 30 in. square by 9 in. deep. A non-slipping phosphor bronze belt transmits the movement of the float to a sheave on the transmitter mechanism. Each mitre-forcing machine has its open and closed positions shown by red and green lamps and a mechanical indicator. The control boards themselves are of the flat-top desk type, 32 in. high by 54 in. wide, and the lengths are 36 ft. at Pedro, 52 ft. at Miraflores, and 64 ft. at Gatun. The switch handles work through 90°, and are just above the board, while just below are the contact fingers and synchronous receivers. The control circuits are worked with 220-volt 25-cycle single-phase current. The switches are all interlocked, so that flooding in wet weather and waste of water in dry weather are avoided. These interlocks, of the bell crank and rod type, are arranged in two vertical racks below the control board, so that they can be inspected from a lower floor. All small parts of the equipment have been made of brass, copper, Monel metal, bronze or sheradised iron or steel. Mica and impregnated asbestos have been used largely in place of fibre or wood, owing to the humid atmosphere. The combined weight of the control boards is about 39 tons.

## AIR-BLAST COOLED TRANSFORMERS

A PAPER summarising the results of some tests on a 12-k.v.a. 200-volt 50-cycle 1:1 ratio transformer was read by Mr. F. J. Teago before the Manchester Section of the Institution of Electrical Engineers on March 24th. The meeting was held at the Liverpool University, and a demonstration of the apparatus used in the tests was made. Particulars of the transformer used in the tests are as follows:—

**Core.**—Rectangular; net cross-sectional area, 7.75 sq. in.; maximum flux density, 80,000 lines per sq. in.; plates, 0.02 in. stalloy; one ventilating duct, 0.407 in. wide; net weight of iron, 82 lb. **Coils.**—Sandwiched; six primary coils, each of twenty-four turns of strip 0.63 in. by 0.0472 in.; four secondary coils, each of thirty-six turns of strip 0.944 in. by 0.02955 in.; current density, 2,200 amperes per sq. in.; net weight of copper, 48 lb.; estimated amount of air, for mean coil rise of 50° C., with inlet air at 15°–20° C., equals 5 cub. ft. per sec. The transformer had a sheet-iron case, and the air was discharged outside the building. The air was forced along a baffled pipe 7.7 in. internal diameter, and measurements were made by means of a Brabbé tube and differential manometer. The first set of experiments was made to find out whether the varying humidity of the air had any effect on its cooling properties. The result was negative. Four thermo-couples were used for the temperature measurements—one in the duct near the iron and the inside surface; one in the duct near the iron and the top outside surface; one in the space between the middle primary and lower secondary coil, in about the centre of the limb face; and another in the same space and up against the wooden strip covering the corner of the iron. Since the latter was largely protected from the cooling effect of the air on account of the wooden strip, it was thought likely that the surface rise of temperature of the coils was a maximum at that point. It was found that the surface temperature rise of the coils at that place was equal to the mean, as determined by resistance measurements. A number of tests were made with air rendered "fogged" by atomised water. In one series of tests, 436 grammes of water per hour were used, and in another 914 grammes per hour. These quantities were expected to decrease the temperature rise by 33 and 66 per cent. respectively. It was found that the first thermo-couple showed a greater decrease, the second a less, and the third a decrease approximately equal to that anticipated. No injury was done to the insulation by the water. The insulation resistance was low immediately after a test, but this was due to condensation on the bare ends of the windings. When these were dried the normal insulation resistance of 10 megohms was obtained. Better atomisers can be obtained than were used in the tests, so that better results should be obtainable. By varying the quantity of ordinary cooling air over a number of tests it was found that, from any particular value of total watts loss, cub. ft. of air per sec. × mean rise of temperature of coil = constant. Hence, by determining two values the others can be deduced. In the transformer tested at 8 k.v.a. no air was found to be necessary, and for 20 k.v.a. 9 cub. ft. per sec. was necessary. Experiments on a similar transformer, only with no air duct, but with a chambered core, are in progress.

**Recording Pyrometers.**—A Paper by Prof. C. R. Darling read before the Faraday Society yesterday described several patterns of recording pyrometers. For research purposes and for accurate work under steady conditions where the temperatures do not exceed 1,000° C., the resistance pyrometer was stated to be the best, but for conditions prevailing in industrial work the thermoelectric pyrometer was usually more suitable. Above 1,200° C. radiation pyrometers were generally used, recording by thermoelectric means. A number of instruments for making automatic continuous records on paper charts were described, in many of which the pointer is normally free to swing without touching the paper, but is periodically caused to make a mark. The Callender and other recording resistance pyrometers were also described, and reference was made to photographic recording methods and semi-automatic methods, in which the observer follows the motion of a spot of light.

**The San Francisco Engineering Congress.**—Arrangements are advancing for the Engineering Congress to be held at San Francisco in 1915, and applications for enrolment have already been received from 42 countries. Among the ten sections into which the congress is to be divided, one will deal with electrical and mechanical engineering. Full information can be obtained from the Committee of Management of the International Engineering Congress, 1915, Foxcroft Building, San Francisco, Cal., U.S.A.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,388.

An earth indicator is connected up as in Fig. 1 on a three-phase star-connected system supplied through a transformer as

FIG. 1.

shown. What is the mistake? How ought the instrument to be connected? Explain its uses and action.—SPARK.

(Replies must be received not later than first post, Thursday, April 30th.)

### ANSWERS TO No. 1,386.

With an electric crane brake of Laurence Scott's flapper type, trouble is experienced by wearing of the wooden blocks owing to the load being too light to attract the flapper. The motor is rated at 22 h.p. at 600 r.p.m. The crane is designed for 20 tons, but is used for an average load of about three tons. Can any remedy be given for the trouble, which cannot be got rid of by adjustment of the springs.—POTENTIOMETER.

The first award (10s.) is given to "L. B." for the following reply:—

The trouble encountered with this special form of brake magnet can easily and cheaply be remedied by arranging to insert some resistance in parallel with the motor armature on the first starting notch of the controller, in addition to the usual series resistance. This obviously can be adjusted so that the series field will attain the required strength to operate the brake, while allowing only sufficient current to armature to obtain the torque required. On the second notch of controller this parallel resistance should be cut out, as the brake flappers once attracted will hold with very low loads; with the first step of series resistance or independently as may be most convenient to arrange. This parallel resistance feature, correctly designed, gives also an additional safeguard, as at starting positive control over the hoisting and lowering is obtained. For full information as to technical data see answer to Question 1,286 (ELECTRICAL ENGINEERING, Vol. VIII., p. 279, May 23rd, 1912).

In the unlikely event of the brake flappers releasing after cutting out this parallel resistance, the following may be resorted to:—Adjust the springs until the brake will hold when attracted. Utilise a lower speed than at present when running, i.e., always run with some series resistance in circuit and resistance in parallel with armature. This is, however, wasteful in current consumption. Rewind the field coils to

suit the average load, diverting part of the current when the crane is required for large load.

The second award (10s.) is made to "M. M.," who writes as follows:—Before making any extra fittings be sure that the brake is in correct adjustment. All the joints should work easily, but without any "idle" motion. The springs must be set so that they will just have sufficient tension; anything beyond this will require a proportionately stronger pull on the part of the flappers, FF (Fig. 2). Failing this, it might be possible to shorten distance between the fulcrum, O, and the brake blocks; it should not be very difficult to fasten a second fulcrum to those already in position. Improvements might also be effected on the flappers; for

FIG. 2.

the greatest effort they should be set so that greater number of magnetic lines pass between pole and flapper at maximum distance from O. As a last resource an arrangement as indicated by the accompanying diagram is suggested; with this there should be no difficulty in relieving the brake. RR are two iron rings which form yoke and armature of a solenoid respectively; one is fastened to frame of motor, and carries two coils; to the other is attached the plungers and two toggle links, QQ. These toggle links engage with flapper levers by means of the movable pieces, TT, this affording a convenient method of adjustment. Solenoid coils can be joined up in the magnet circuit, and with very little expenditure of energy will give extra brake relieving effort as may be required.

## AN ARMATURE REPAIR

A PAPER entitled, "Breakdown of a D.C. Motor Armature," by Mr. F. Church, was read before the Midland Branch meeting of the Association of Mining Electrical Engineers at Nottingham recently, and will be discussed at the Warwickshire and Staffordshire and Yorkshire Branches. The breakdown in question was due to copper and carbon dust from the commutator and brushes collecting behind the commutator lugs, and being retained by the insulating lacquer which was softened by the heat. A conducting path was thus formed between the commutator segments and the armature spider. It was found possible to repair the armature without removing the commutator by unsweating these groups of lugs, which gave sufficient access to scrape out the conducting mixture of lacquer and dust. The armature was then dried out by heating electrically by means of resistance wires wound round it, and while hot the exposed portion of the commutator sleeve was well coated with air-drying lacquer. Afterwards a single layer of cotton tape was wound round the sleeve. The lacquer was applied to the back of the commutator segments in a thin layer and allowed to dry. When thoroughly dry, the whole of the interior was given a second coating of "Votalac." When this was dry, a layer of brown paper was laid over the lacquered parts, and then the conductors were re-sweated into their respective lugs, care being taken to have the conductors and lug to be sweated in such a position that the solder ran away from, and not into, the interior of the armature. The cord binder was then placed in position and the temperature of the armature raised to 100° F.

To prevent this kind of failure, continues the author, the space between the commutator lugs must be filled in so as to make it impossible for the copper and carbon dust to pass through. The only way to prevent this class of fault effectually is to have the commutator segment and lug made in one piece, and the mica extended to the top. With armatures up to 20 h.p., the lugs can be made short and the ends of the conductors laid obliquely from the lugs to the slots. Impregnated tape should be laid beneath the conductors to prevent any dust passing between them to the back of the commutator.

### ELECTRIC TRACTION NOTES

Some details of the locomotives for the Usui-Toge (Japan) rack railway (*ELECTRICAL ENGINEERING*, March 19th, p. 159) are contained in the March issue of the *A.E.G. Journal*. There are three adhesion driving wheels, which each take about one-third of the total weight of 42 tons. There are two motors, each of 350 h.p. at 650 r.p.m. on the hourly rating. One is used for the adhesion and the other for the rack drive. In the former case the motor is rigidly mounted in the spring-supported main frame. It works with a gear ratio of 1:6.4 on to the gearing shaft, and from here on to the jack shaft, also rigidly supported in the framework, from which the driving wheels are driven by coupling rods. The two pinions are mounted on two axles in the fixed inner frame; the pressure of the gearing teeth is here taken up by the movement of the springs. The inner frame also carries the rack motor. This is spring-suspended at one end from the outer frame, however, in order to keep the dead weight of the unsprung masses as low as possible. It is mounted on a cast-steel bracket which can turn, and works on to the gearing similarly to the adhesion motor, but the ratio is 1:5.9. From here a driving rod works on to a pinion axle. Both axles are connected by coupling rods, and, as in the adhesion drive, the cranks are set at an angle of 90°. There is a friction coupling between the rotor shaft and pinion which slips when a certain torque is exceeded. The control is through contactors contained in asbestos-lined compartments along the sides of the locomotive. The control current is obtained from forty secondary cells. The controller has three drums, the extra one being on account of the rack. The rack motor normally runs at no-load, and synchronism between the two motors is obtained by connecting the field of the rack motor in series with the field and armature of the adhesion motor, both armatures being in parallel. On the rack sections the usual series-parallel control is adopted. At the maximum series and maximum parallel positions of the controller the fields are shunted. A short-circuit brake, which is always used when travelling on the down gradient, is provided. The armature of one motor is connected in series with the field of the other and with the resistances used for starting. This crossed brake connection makes the brake act with certainty whether the position of the reversing controller corresponds to the direction of rotation of the motors or not. In the event of the current failing in the third rail while the train is travelling upwards, the driver only has to remember that the grouping drum must be placed on the position "brake" before the braking can be carried out at the main drum. The locomotives can pull a train of 90 tons, or when two are used, as is usual on a train of 180 tons, up a gradient of 6.7 per cent. at about 10 m.p.h.

It is stated that a Company known as La Société Anonyme des Tramways Eclairage et Force Electrique de Bagdad has been formed by the National Electric Construction Co., for the construction and working of tramways, and also for giving a supply of electricity in Bagdad. The concession provides for a lease of seventy years, and the municipality is to participate in profits after the first twenty years.

It is stated that the electric train service on the London & North Western Railway between Willesden and Earl's Court will commence on May 1st.

Last Thursday evening the service on the Great Northern & City Railway was suspended for about three hours, due to a burn-out on a 0.8 sq. in. 600-volt feeder in the tunnel.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The patent infringement action between Marconi's Wireless Telegraph Co. and the Helsby Wireless Telegraph Co., which has been on Mr. Joyce's list for several sittings, has now been transferred to Mr. Justice Eve's list. Prof. Bertram Hopkinson has been appointed assessor to sit with the judge, and the action is expected to commence on June 23rd.

The French Administration notifies the opening of offices at Benguerir, Benhamed, Berrechio, Boucheron, Boulhaut, Bouznika, Darbelhamri, Guicer, Hadjeb, Maaziz, Marchand, Mechrabelksiri, Mechrabenabbou, Monod, Ukrelia, and Tiflet in Morocco, and messages must be routed *via* Tangier.—The Cayenne-Salinas cable of the French Co. is in working order.

## BELLING ELECTRIC GRILLER and TOASTER.

**A large strong griller for kitchen work complete with close mesh grid and drip pan.**

**READY for USE**

**in less than one minute.**

**VERY SIMPLE CONSTRUCTION.  
DOES ITS WORK PERFECTLY.**

**Actual cooking space  
15½ ins. long by 7¾ ins. high  
by 11¼ ins. deep.**

Griller with elements (7 bars) and terminals 42/- Subject.

**Electric Heating & Cooking Specialists,  
Edmonton, . . . LONDON, N.**

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 231. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**HEATING AND COOKING APPARATUS.**—A new catalogue from Ferranti, Ltd. (Central House, Kingsway, W.C.), in the form of a number of leaflets conveniently arranged in a cover, deals with the latest patterns of electric heating and cooking apparatus manufactured by the firm. The basis of most of this apparatus is a disc type element. This is covered with a quartz plate in their "electric fires," which are listed in numerous varieties, and in an iron case, forms a cooking element which can be mounted as a single boiling plate in various styles. The grills, however, have a different type of element of open wire in fire-clay mounting, and several combinations of boiling plates and grills are made. The disc element is used in the ovens, and these again can be combined with grills and boiling plates. The whole range of apparatus appears substantial and well made, and the interchangeability of parts is a great recommendation.

**DRY CELLS.**—A new catalogue embracing Siemens-Obach dry cells, ignition coils, leather cases for dry cells, Hellesen dry cells, Dura cells, and Siemens transport cells has just been sent us by Siemens Bros. & Co., Ltd. (Woolwich, S.E.). The Siemens-Obach dry cell is made in a very large number of sizes suitable for many kinds of work. Each cell gives about 1.5 or 1.6 volts, and this has been found to fail by only some 4½ per cent. after 33 months' storage, and at the same time the increase in internal resistance was not great. The Hellesen dry cell is also made in a number of sizes, and can be used for similar purposes to the Siemens-Obach. The exciting agent of the Dura cells is in a dry and inactive condition when they leave the works, and thus can be stored without deterioration. The addition of water makes them ready for use.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**SIGNS.**—In the latest catalogue of electric signs for advertising issued by the Sun Electrical Co., Ltd. (118 and 120 Charing Cross Road, W.C.), are illustrations of a large number of popular designs, and also of signs specially designed for particular businesses. Many of these, we learn, have been recently supplied to large advertisers. Programme indicators and accessories for music halls and cinemas are also dealt with. Some of the signs are very artistic, and not a few are particularly novel and effective, and as the Sun Co. has specialised for a long time in this branch of electrical engineering, those interested in signs cannot fail, after a perusal of this comprehensive publication, to appreciate to what a fine art the business has come.

**BITUMEN AND JOINT-BOX COMPOUNDS.**—We have received from the Dussek Bitumen Co. (Canal Bank, Deptford, S.E.) a pamphlet dealing with the manufacture of Trinidite joint-box compound, which points out the features that should be present in satisfactory compounds for the purpose, and explains how certain tests commonly applied are misleading in their results. A further booklet indicates how widely this compound is used and appreciated. Very satisfactory tests of this joint-box compound have been made by the National Physical Laboratory, at the request of the Admiralty, and at Faraday House.

**FANS.**—A neat folder from the Edison & Swan United Electric Light Co., Ltd., deals with electric fans, and can be overprinted with names of contractors.

**INDUCTION MOTORS, &c.**—The Langdon-Davies Motor Co. (110 Cannon Street, E.C.) has issued new catalogues of single, two- and three-phase induction motors of the squirrel-cage and slip-ring types in various forms. Another list deals with Megger testing sets.

**BRAKE AND CLUTCH LINING.**—A pamphlet from the Herbert Frood Co., Ltd. (Sovereign Mills, Chapel-en-le-Frith), contains some results of tests of the well-known "Ferodo" materials for lining clutches and brakes made recently at the National Physical Laboratory, showing remarkable constancy of the coefficient of friction, excellent heat resisting quality, and very small wear.

**FUSES.**—A revised edition is to hand from Turners & Manville, Ltd. (Hopetown House, Lloyd's Avenue, E.C.), of their catalogue of "Noark" fuses, which in their latest improved forms are listed in a large number of sizes for potentials up to 22,000 volts, complete with various accessories, fittings, &c.

### FUSES FOR SQUIRREL-CAGE MOTORS

IN protecting squirrel-cage motors in the ordinary course there is some difficulty in deciding on the rating of the fuses. These motors naturally take a much larger starting current than running current, and if a fair margin is left over the starting current in deciding the size of the fuse, the fuse will be too big to protect the motor adequately against prolonged overloads during running. To overcome this, the Kartret Engineering Co. (Queen Anne's Chambers, Westminster, S.W.), in conjunction with Mr. E. Farndon (Sales Manager,

FIG. 1.—ELEVATION AND SECTION OF "TWO-RATE" SWITCHES AND FUSES.

West Ham Corporation Electric Supply), have patented a "two-rate" switch and fuse, which is now being placed on the market. On each pole there are two fuses and switches, one for the starting current and one for the running current. In starting the motor, the handle is lifted and both pair of switches are closed simultaneously, so that the two fuses are in parallel. As soon as the motor has attained running speed, the operator removes his hand and the starting switch

FIG. 2.—SECTION OF "KARTRET" SWITCH.

opens automatically, but the running switch remains in. The whole arrangement is extremely simple and effective. Fig. 3 is a photographic view of a two-pole single-phase switch and fuse-box, and also shows that there is a difference between fuse-holders for the starting and running positions, so that the two are non-interchangeable. Fig. 1 is an elevation and section of a similar set of switches and fuses, and Fig. 2 is

**"Prana" Lattice Armouring**  
in steel, copper, brass or phosphor-bronze.

☐ For the protection of Rubber Hose, Flexible Tubing, Cables, &c., &c.  
☐ Neat in appearance, extremely flexible, rust-resisting.  
☐ Low cost.  
☐ Especially adapted to the protection of "Sud" connections.

**"Prana" Die Castings**  
are ready for assembling.  
☐ The dies in which they are cast are virtually a gauge, so that further examination is unnecessary.  
☐ They cannot vary.  
☐ Made from alloys of guaranteed soundness.  
☐ British owned and made—"Tough and True."  
*Let us send you particulars and samples.*

**"PRANA" DIE CASTINGS.**

AERATORS LTD. (INCORPORATED) UPPER EDMONTON, LONDON, N.

a section of the Kartret switch which is employed. The apparatus is made in sizes for 10, 15, 25, 50, 75, 100, and

FIG. 3.—"TWO-RATE" FUSES AND SWITCHES.

150 amperes running current, the rating of the starting current side being for a maximum of three times these values.

### ELECTRIC LIGHT SWITCHING COMPETITION

IN our next issue will be published the results of the latest of Messrs. A. P. Lundberg & Sons' periodical competitions or examinations in "Electric-Light Switching," directed particularly to the control of incandescent lamp circuits by means of more or less special types of tumbler switch. Those who have not given much attention to the subject will doubtless wonder what there is therein to afford a foundation for three grades of examinations. They will cease to wonder if they dip into a little booklet entitled, "Lektrik Lighting Connections," issued by the above firm, and upon which the examinations are based. The list of competitors (which includes only those whose papers were satisfactory) is remarkable both as regards the number and the varied positions of the candidates. We are informed that a great many are engaged every day in electric light work in various capacities, but, on the other hand, there is a fair sprinkling of graduates and students of the I.E.E. This shows that the subject has proved of interest to classes of electrical workers who do not generally trouble about examinations; and to some who might be prone to regard electric wiring as beneath their consideration.

The arrangement of lighting circuits to obtain the utmost refinements of control is a branch of electrical work deserving more attention than it often receives, and with a view to encouraging its study we have made arrangements for the publishing of the next examination papers in ELECTRICAL

ENGINEERING during November next. The Preliminary Grade should form a useful preliminary study to those who intend afterwards to sit for the City Guilds' Examination in Electric Wiremen's work; and the Intermediate and Advanced Grades will afford plenty of scope for those who have not yet tried their hands at multipoint variable, restrictive, master, pilot, and various other kinds of lamp circuits. An important feature of some of these controls is that they are being largely used in electric heating apparatus; and there are quite a number specially devised for small motors and miscellaneous purposes.

### UNDERGROUND STATION LIGHTING

THROUGH the courtesy of the Underground Railway Authorities, and of the General Electric Co. (87 Queen Victoria Street, E.C.), we are enabled to illustrate another example of underground station lighting, carried out by Osram lamps in conjunction with "Superlux" glassware. The in-

STATION PLATFORM AT PADDINGTON (BAKER STREET AND WATERLOO RAILWAY).

stallation in question is at the recently-opened Paddington station of the Bakerloo line, and the photograph reproduced, which was taken entirely by the light from the ordinary lamps, shows the brilliance and uniformity of the illumination produced.

### RESTAURANT LIGHTING

THE lighting of some of the principal rooms at the Criterion Restaurant has recently been rearranged by the equipment of the fittings with Mazda lamps and Veluria reflectors, supplied by the British Thomson-Houston Co., Ltd.

THE GRILL ROOM AT THE CRITERION RESTAURANT.

(Mazda House, 77 Upper Thames Street, E.C.), and a considerable improvement in the illumination has been the result. The installation in the grill room, which is illustrated here, consists of seventy 40- and 60-watt Mazda lamps in intensive

type Veluria reflectors. There are also 158 20- and 40-watt units in the Victoria and Grand Halls, while the vestibule of the latter is lighted by four 100-watt Mazda lamps in Veluria shades. It may be mentioned that this form of lighting was installed first in the grill room as an experiment. The success of the experiment is indicated by the fact that the same system of lighting has now been extended throughout the restaurant.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Ayr.**—A loan of £25,000 for plant extensions is to be applied for.

**Belfast.**—Electric cables for Belfast Harbour Board. Harbour Engineer. April 29th.

**Belgium.**—Tenders are invited by the municipal authorities for electric cable by May 4th, and for three transformer sub-stations by May 18th. Burgomaster, Hôtel-de-Ville, Antwerp. Copies of the specification may be seen at 73 Basinghall Street, E.C.

**Braintree.**—The electric lighting scheme prepared by Mr. H. P. Girling, referred to in our last issue, has been adopted by the Council.

**Flint.**—An electric lighting scheme at an estimated cost of £5,000 is under consideration by the Council.

**Guisborough.**—An electric lighting scheme is under consideration by the Council.

**Inverurie.**—Negotiations are being carried on with the North British Railway Co. for a supply of electrical energy in bulk.

**Leeds.**—12,000-kw. turbo-alternator, condensing plant. Manager, Electricity Department. May 11th.

**London: Southwark.**—The Electricity Department requires 110 yards of 0.5 sq. in. three-core, paper-insulated and lead-covered cable. Borough Electrical Engineer. April 29th.

**Walsall.**—A loan of £3,000 for mains extensions is to be applied for.

### Wiring

**Lincoln.**—Wiring of Nurses' Home and Ward at County Hospital. Secretary.

**London: Lambeth.**—Electric motors and wiring installation at the infirmary, Brook Street, Kennington Road. Clerk to Guardians.

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make enquiries to ascertain whether electrical work will be required.*

**Bath.**—New Territorial drill hall.

**Cardiff.**—Fire station in Westgate Street. Town Clerk.

**Northampton.**—New post office. H.M. Office of Works, Storey's Gate, London.

**St. Alban's.**—County school at Fleetville. County Surveyor, Hatfield.

**Stockport.**—Bakery and warehouse buildings for Stockport Co-operative Society. Architects, Wrathmell & Blackshaw, St. Peter's Square.

**Worcester.**—Elementary school, Stanley Road. City Architect.

### Miscellaneous

**Dover.**—A loan of £1,600 is to be taken up for the conversion of further gas lamps to electricity.

**Spain.**—Four electric portal cranes are required for the port of Cadiz. Junta de Obras del Puerto de Cadiz.

## TENDERS RECEIVED AND ACCEPTED

**Birmingham.**—Contracts for electrical stores for the ensuing year have been placed by the Birmingham, Tame & Rea District Drainage Board with the General Electric Co., Electrical Trades Supply Co., and Callender's Cable & Construction Co.

**Bootle.**—A contract has been placed with the B.T.-H. Co. for a twelve months' supply of M.H. mercury meters.

**Bristol.**—The Tramways Co. has placed a contract with Siemens Bros. Dynamo Works for a twelve months' supply of carbon-filament lamps.

**Canada.**—The Westinghouse Cooper Hewitt Co. has received a contract from Messrs. Vickers, of Montreal, for the lighting of their shipbuilding yard at Maisonneuve.

**Dundee.**—The contract for a 750-kw. rotary-converter has been placed with the British Thomson-Houston Co.

**Halifax.**—The following tenders have been accepted for the supply of stores for 1914-15:—Carbon lamps, lampholders, tumbler switches, and bow cut-outs, London Commercial Electric Stores; metal-filament lamps, L. Andrew & Co., and the Corona Lamp Co.; general electrical accessories, British Insulated & Helsby Cables, British Thomson-Houston Co., India-Rubber, Gutta-Percha and Telegraph Works Co., and W. Geipel & Co.; cables, Northern Electric Wire Co.; telephone wire, Gillespie & Beales; E.H.T. and L.T. cable, British Insulated & Helsby Cables; A.C. meters, Chamberlain & Hookham; D.C. meters, Chamberlain & Hookham and Ferranti; house service meters, British Insulated & Helsby Cables.

**London: Admiralty.**—The Edison & Swan United Electric Light Co. has secured part of the twelve months' contract for the supply of Royal Ediswan lamps.

**Newport (Mon.).**—A contract has been placed with Siemens Bros. Dynamo Works, for a supply of carbon-filament lamps.

**Pontypridd.**—The following contracts have been placed for electrical stores during the next twelve months:—Overhead equipment, Brecknell, Munro & Rogers, Imeson, Finch & Co., Fleming, Birkby & Goodall, Haslam & Schontheil, Watlington & Co., W. F. Dennis & Co., British Insulated & Helsby Cables; joint boxes and service boxes, British Insulated & Helsby Cables, W. Lucy & Co., Sykes & Sugden; insulating material, L. Andrew & Co., Baxendale Bros., British Thomson-Houston Co., Micanite & Insulators Co., Siemens Bros. & Co., India-Rubber, Gutta-Percha & Telegraph Works Co., W. T. Henley's Telegraph Works Co., Armorduct Manufacturing Co., Brecknell Munro & Rogers, British Westinghouse Electric & Manufacturing Co.; tram-car equipment, P. R. Jackson & Co., British Thomson-Houston Co., Morgan Crucible Co., Haslam & Schontheil, Fleming, Birkby & Goodall, The Equipment & Engineering Co., Siemens Bros. & Co.; installation stores, H. A. Jackson & Co., Ward & Goldstone, Metallic Seamless Tube Co., Edison & Swan United Electric Light Co., Veritys, Ltd., Siemens Bros. Dynamo Works, Berry, Skinner & Co., General Electric Co., Baxendale Bros., Drake & Gorham, British Thomson-Houston Co., India-Rubber, Gutta-Percha & Telegraph Works Co., Wandsworth Electric Manufacturing Co., British Thomson-Houston Co., Siemens Bros. Dynamo Works, General Electric Co., Cryselco, Ltd.; cables, Macintosh Cable Co.; flexible cable, Callender's Cable & Construction Co.

**Salford.**—The Tramways Department has placed a contract with Siemens Bros. Dynamo Works for a twelve months' supply of Wotan, Tantalum, and carbon-filament lamps.

**South Shields.**—The following contracts have been placed by the Electricity Department:—Feed pumps, G. & J. Weir; induced draught plant, Musgrave & Co.

**Walsall.**—A contract has been placed with Callender's Cable & Construction Co. for 277 yds. of mains to link up the Marlow Street and Darwall Street sub-stations, at £1,015.

**West Hartlepool.**—A contract has been placed with the Bastian Meter Co. for the supply of meters up to 10 amperes.

**Wrexham.**—The following tender has been accepted for carbon filament lamps:—Edison & Swan United Electric Light Co., 8, 16, and 25 -c.p. 5s. 3d. per dozen, 32-c.p. 6s. per dozen. Seventeen tenders were received.

Messrs. Venner & Co. have received the contract for both ordinary and prepayment meters (Chamberlain & Hookham) for Colchester. Messrs. Chamberlain & Hookham have received contracts for the supply of meters to Birmingham, West Hartlepool, and Holyhead.

FOR  
**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

### LOCAL NOTES

**Carlisle: Plant Extensions.**—The Local Government Board has sanctioned the borrowing of £16,958 for the extensions of plant recently advertised, but has asked for further information with regard to the proposed second alternator and rotary-converter.

**Dover: Public Lighting.**—Mr. L. W. Woodman, the Borough Electrical Engineer, has reported upon a proposed further conversion from gas to electricity for street lighting.

**Dudley: Public Lighting.**—Already improvements are showing themselves in the Dudley electricity undertaking, consequent upon its acquisition by the Worcestershire, Staffordshire & Shropshire Electric Power Co. The introduction of new lamps for street lighting purposes has greatly improved the public lighting, and a new sub-station and central offices are under construction.

**Edinburgh: New Power Station.**—A special sub-committee has been considering a report by the consulting engineer, Sir Alexander Kennedy, to the effect that it will be necessary at an early date to take steps to extend the generating plant of the electricity undertaking. The matter has been treated from two points of view, viz., extending the M'Donald Road station, and erecting a new station. One of the difficulties in the way of the first proposal is that an additional expenditure of £40,000 will be required for condensing plant than would be necessary at a new station. This proposition was therefore reported against by Sir Alexander Kennedy, and the acquisition of a site at Portobello for the erection of a new station is recommended.

**Galashiels: Electric Supply.**—The Council has at last agreed with the Galashiels & District Electric Supply Co. as to the various details in the Company's proposed electric lighting order, to which consent has now been given.

**Keith: Electric Lighting.**—The Council is endeavouring to arrange an interview with the India-Rubber, Gutta-Percha and Telegraph Works Co., which is putting in an electric light installation in Lossiemouth, with a view to a similar installation being put down in Keith.

**Lytham: Bulk Supply.**—An agreement has at last been reached for taking a supply of electrical energy in bulk from the St. Anne's-on-Sea Council. The supply will be given at the boundary of the district on the terms of £5 per kw. for a maximum demand up to 100 kw.; £4 between 100 and 200 kw.; £3 10s. between 200 and 300 kw.; and £3 between 300 and 400 kw. plus ½d. per unit in all cases up to 200,000 units, and 1½d. per unit for all current taken beyond this quantity.

**Macclesfield: Electric Supply.**—The new Electricity Co. of Macclesfield inaugurated the supply of electricity last week.

**Swindon: Power-House Extensions.**—Tenders were recently received for additional foundations and condenser pit for the new plant at the electricity works, but the Electricity Committee has decided not to accept any tenders, and to carry out the work itself under the direction of the Borough Surveyor and the Electrical Engineer.

**Taunton: Plant Extensions.**—The Local Government Board has formally sanctioned the borrowing of £4,765 for new generating plant for which tenders have already been invited.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £66 10s. to £67. (Last week, £67 to £67 10s.)

**Agencies.**—T. W. Broadbent, Ltd. (Victoria Electrical Works, Huddersfield), have appointed James C. Fisher & Co. (62 Robertson Street, Glasgow) to represent them in Scotland for sale of motors, generators, &c. Mr. J. D. Mackenzie, formerly their Scottish agent, has ceased to represent them.

Mr. F. J. Lyons-Davis (23 Victoria Avenue, Cardiff) has been appointed sole agent in South Wales for Mawdseley's, Ltd. (Dursley), for the sale of their patent "Zone" dynamos and motors.

**Bankruptcies.**—W. H. Pease, Royal Hotel Shops, Scarborough, has been adjudicated bankrupt.

The trustee in the bankruptcy of J. Cunnington and H. P. Allison, trading as Laing, Wharton & Cunnington, at 7 Great Newport Street, London, has been released.

The first meeting of creditors of D. Smith & Co., dealers in electric lamps, 2 and 3 Red Lion Court, Fleet Street, E.C., will be held on April 29th at 11.30, at Bankruptcy Buildings, Carey Street, London. The public examination will take place on May 26th, at 11 a.m., at the same address.

A first and final dividend of 6s. 2d. in the £1 will be paid on April 28th at 27 Ainsworth Street, Blackburn, in the bankruptcy of J. W. Garsden, Electrical Engineer, 24 Preston New Road, Blackburn.

**Liquidation.**—The official receiver's report in the liquidation of the Grindell-Matthews Wireless Telephone Syndicate shows liabilities at £6,238, and assets valued at £24,761, after payment of all duties. A committee of inspection has been appointed.

### APPOINTMENTS AND PERSONAL NOTES

The salary of Mr. A. Prentice, Station Superintendent at the Walsall Electricity Works, is to be increased from £200 to £225 per annum.

The Malvern U.D.C. has received thirty-three applications for the post of Electrical and Gas Engineer, rendered vacant by the removal of Mr. W. H. Johns to West Bromwich. The salary is £350 rising to £400 per annum. The list of three consists of Mr. R. A. S. Browning, Assistant Engineer and Works Superintendent, Birmingham Gas Works; Mr. Walter Gregson, Superintendent of the Eastcroft Gas Works, Nottingham; and Mr. S. T. Smith, Engineer and Manager of the Leek Urban Council's Gas Department.

The salary of Mr. W. G. Pickvance, Borough Electrical Engineer at Wrexham, is to be increased from £275 to £325, and there will be two further annual increments of £25.

The South Wales Electrical Power Distribution Co. requires an assistant in the testing department. (See advertisement on another page.)

Several junior engineers are required for the contract department of a motor manufacturing firm in Manchester. (See advertisement on another page.)

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Johnson & Phillips.**—The trading profit for 1913 was £33,175, to which is added £3,315 brought forward from 1912. After deducting debenture interest and writing off £6,155 for depreciation on machinery and plant, a balance of £12,755 is carried forward.

**Willans & Robinson.**—There was a net profit of £8,782 last year, after payment of debenture interest, provision for depreciation, and the upkeep of Queen's Ferry Works. Important contracts for steam turbine installations and Diesel oil engines were concluded during the year, and the business in hand is promising.

**Brush Electrical Engineering Co.**—At the annual meeting on Monday, the report and accounts given in our issue for April 16th, page 221, were adopted. Mr. E. Garcke, who presided, drew particular attention to the fact that the Company is now on the up grade, and that the conditions of the Company's operations are less harassing than they have been for some years. Particular reference was also made to the installation of the first Ljungstrom steam turbine in this country at the Willesden station of the North Metropolitan Electric Power Supply Co., the conditions of this contract being that the set should be subject to a lengthy trial under service conditions before acceptance. This test has been duly completed, and the generating set has been taken over by the Power Co.

**Faraday House Electrical Engineering College.**—At the recent examination for entrance scholarships held at Faraday House, Mr. W. G. Radley, of Leeds Modern School, was awarded the Faraday Scholarship of 50 guineas per annum, tenable for two years in College and one year in Works, and Mr. C. H. B. Ewbank, of Epsom College, the Maxwell Scholarship of 50 guineas per annum, tenable for one year in College and one year in Works.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published April 16th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

4,779/13. **Receivers for Wireless.** F. J. CHAMBERS. The receiver is connected directly or inductively to an oscillatory circuit, with an inductance of at least 20 henries and low decrement, tuned to the group frequency or a multiple of the received oscillations. The coupling may be effected through an iron-cored transformer, whose primary is in series with the detector and telephone. The oscillatory circuit should be tuned to approximate to the natural period of the telephone diaphragm. Arrangements to reduce the transformer losses are shown. Nine figures.

7,600/13. **Stator Windings of Turbo-Alternators.** B.T.-H. Co., F. H. CLOUGH, and L. DUNKER. To minimise the trouble due to eddy currents the winding consists of more than two rectangular component bars transposed in the slot. The two outer bars are bent at two places, and the inner bar or bars are bent at three places. Eight figures.

7,610/13. **High-Power Transmitters for Wireless.** G. MARCONI and C. S. FRANKLIN. The main discharges are timed to occur in correct relation to the phase of the current in the aerial. The main circuit contains a condenser, which is alternately charged and discharged in opposite directions, and spark-gaps which the main current cannot pass across unless assisted by a disc discharger in an auxiliary circuit. One figure.

15,148/13. **Closing Induction Motor Slots.** SIEMENS DYNAMO WORKS, C. A. B. D. KOETTGEN and E. O. KIEFFER. A trough-shaped key of magnetic material is inserted in the slots. It has lapped-over edges, and a base with a kink or depression, which is straightened after insertion.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

*Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.*

**Arc Lamps:** B.T.-H. Co. (*G.E. Co., U.S.A.*) 8,416/13; MARKS (*Siemens-Schuckertwerke Ges.*) [Search-lights] 18,997/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** SIEMENS-SCHUCKERTWERKE GES. [Loom driving] 7,842/13; [Automatic control through relays] 27,824/13; [Controlling motors for ship propulsion] 13,148/13; WATERS [Protective systems] 25,274/13; CHASE [Armouring cables] 29,028/13.

**Dynamos, Motors, and Transformers:** PEUGEOT, 7,840/13; MASON [Dynamos] 8,128/13; BROWN, BOVERI ET CIE [Cooling] 14,941/13; CHRISTIE (*Galvanische Metall-Papier Fabrik A.-G.*) [Brushes] 25,464/13.

**Electrometallurgy and Electrochemistry:** HELBRONNER, VON RECKLINGHAUSEN, and HENRI [Milk sterilisation] 7,428/13; GUGGENHEIM [Smelting] 23,004/13; FRIEDR. KRUPP A.-G. [Electrodes] 6,055/14.

**Heating and Cooking:** RIPPINGILLE [Irons] 13,063/13; WILKINSON [Water heaters] 28,847/13.

**Ignition:** SIEMENS & HALSKE A.-G. [Plugs] 18,924/13.

**Incandescent Lamps:** BECKWITH, 8,124/13.

**Instruments and Meters:** A.E.G. [Ampere-hour meter] 9,503/13; ELSTER [Commutators] 5,365/13.

**Switchgear, Fuses, and Fittings:** KETTERING [Automatic regulators for supply systems] 7,544/13 and 7,546/13; LUNDBERG and PEGG [Plugs and sockets] 9,460/13; LUCAS and HANDLEY [Switches] 13,721/13; POULSEN [Switches] 14,034/13; LUCAS and VERITYS [Indirect lighting fittings] 14,170/13; DAY [Lamp-holders] 15,318/13; LUCAS [Switches] 16,885/13; SIEMENS-SCHUCKERTWERKE-GES. [Switches] 17,532/13; BLOXAM (*Robert Bosch*) [Lanterns] 17,954/13; SIEMENS DYNAMO WORKS, LYDALL and BROOKS [Remote controlled switches] 20,870/13.

**Telephony and Telegraphy:** BERNER and DE LISLE [Grappels for raising submarine cables] 25,176/13.

**Traction:** FORSE and SPILLER [Railway signalling] 7,582/13; TAYLOR [Railway signals] 18,801/13.

**Miscellaneous:** WADE (*Schneider & Naujoks Elek. Ges.*) [Overhead lamps] 7,245/13; JACOB and WHITE [Illuminated signs] 7,586/13; MACDONALD [Bells and gongs] 7,638/13; JANSSENS [Synchronising automatic musical instruments and cinematographs] 7,694/13; WALTER [Luminous electrolytic devices] 8,115/13; HELMANN [Mercury vapour lamps] 8,172/13; HAIGH [Starting and stopping a stop-watch] 13,019/13; RENCZEWITZ [Burglar alarms] 20,028/13; SAND and REYNOLDS [Gas-tight seals between metal and vitreous material] 23,854/13; HITZELBERGER and THE NEW BRIT. EVER-READY Co. [Pocket lamps] 24,944/13; BUCKY [Obtaining Röntgen-ray images] 2,815/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** HOCHSTAEDTER [Conductors] 7,766/14.

**Dynamos, Motors, and Transformers:** BROWN, BOVERI ET CIE. [Metal vapour rectifiers] 186/14.

**Switchgear, Fuses, and Fittings:** CHABIER [Reflector arm for electric lamps] 4,627/14.

**Telephony and Telegraphy:** CHAUDET [Crystal detectors] 2,935/14; SIEMENS & HALSKE A.-G. [Supervising apparatus for automatic and semi-automatic telephony] 7,327/14.

**Traction:** BROWN, BOVERI ET CIE. [Braking] 7,265/14.

**Miscellaneous:** ZEHDEN [Burglar alarms] 7,266/14.

The following Amended Specification may now be obtained:—  
**Ignition:** H. G. and W. W. LONGFORD and W. A. CLARK (Sphinx Mfg. Co.) [Sparking plugs] 20,207/11.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

7,471 of April 23rd, 1900. **Quadruplex Submarine Telegraphy.** S. G. BROWN. Two or more transmitters are connected to the cable so that they simultaneously control their batteries, which are of different pressures, to work in series with one another. The receivers are provided with recorders for recording separately, on both sides of their zero lines, the respective sets of signals. An automatic transmitter has two sets of signalling levers, for controlling the batteries, operated by a single perforated tape. The receiving relay closes the circuits of the recording relay only about the middle of every received signal.

7,678 of April 25th, 1900. **Written Character Telegraphs.** A. POLLÁK, J. VIRÁG, J. EGGER, and F. SILBERSTEIN. For each separate element of a written character current impulses are sent automatically into the line of such polarity, strength and succession that they represent the direction, extent, and mutual distance of the parts. An optical telephone is used as receiver.

7,777 of April 26th, 1900. **Wireless Telegraphy.** G. MARCONI the MARCONI Co. The claims of this historic patent are (1) A transmitter for electric wave telegraphy consisting of a spark producer having its terminals connected through a condenser with one circuit of a transformer the other circuit being connected to a conductor and to earth or a capacity the time period of electrical oscillations in the two circuits being the same or harmonics of each other. (2) A system of electric wave telegraphy in which both the transmitter and the receiver contain a transformer the time period of electrical oscillations in the four circuits of the two transformers being the same or harmonics of each other. (3) A system of electric wave telegraphy in which both the transmitter and the receiver contain a transformer one circuit of which is a persistent oscillator and the other a good radiator or absorber of electrical oscillations all four circuits having the same time period or being harmonics of each other.

### Amendments to Specification

4,677/06. **Enclosed Flame Arc Lamps.** BLONDEL. The desired amendments (ELECTRICAL ENGINEERING, Dec. 18th, 1913, p. 718, Vol. IX.) have now been made.

### Grant of Patent Allowed

12,753/13. **Tungsten Lamp Spiders.** WOLFRAM LAMPEN A.-G. The Comptroller has allowed the Grant of this Patent, which was opposed by Brimsdown Lamp Works (ELECTRICAL ENGINEERING, April 2nd, 1914, p. 186).

### Opposition Entered to Grant of Patents

1,915/13. **Manufacture of Tungsten for Drawing into Filaments.** B. T.-H. Co. (*G.E. Co., U.S.A.*). Opposition to the Grant of this Patent (see ELECTRICAL ENGINEERING, Feb. 26th, 1913, p. 118), has been entered by Brimsdown Lamp Works, which cites eight patents as alleged anticipations. Included is No. 5,026/12 granted to J. Hubers on behalf of J. Pintach A.-G. 19,857/13. **Anti-vibration Holder for Incandescent Lamps.** F. H. REEVES (Cable Accessories Co.). Opposition to the Grant of this Patent has been entered.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Dynamos, Motors, and Transformers:** E. ARNOLD and J. L. LA COUR [Single-phase motor] 184/05; E. B. RAYMOND and H. M. RAMP [Transformer casings] 28,427/07.

**Incandescent Lamps:** H. HIRST and WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS [Leading-in] 142/09.

**Switchgear, Fuses, and Fittings:** J. H. DRYSDALE [Plug for use in bayonet or ordinary plug socket] 194/09.

**Miscellaneous:** D. PERRET [Electric clock winding] 157/01.

Telephone No.: 5509 Holborn

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

SOME particulars of the process for manufacturing drawn tungsten filaments as practiced by the American General Electric Co. are given. (Page 236.)

THE balloting papers for the election of the new Council of the Institution of Electrical Engineers will be sent out to-morrow. (Page 236.)

AN article by Mr. E. P. Austin describes an inexpensive form of network feeder with bare aluminium overhead conductors supported by tramway poles. (Page 237.)

THE International Electrotechnical Commission has published its proposals for an international standard of copper resistance. (Page 237.)

A PAPER by Mr. A. M. Taylor, read before the Birmingham Local Section of the Institution of Electrical Engineers, described a method of obtaining from a three-phase supply, single-phase currents at three times the frequency, without the use of moving machinery. (Page 238.)

AT the last meeting of the Illuminating Engineering Society there was a discussion on the lighting of public vehicles. A uniform illumination of about 3 ft.-candles obtained from shaded direct lighting units was adjudged best. (Page 238.)

THE connections to be made in case of a breakdown of one of three mesh-connected transformers are discussed in our Questions and Answers columns. (Page 239.)

AN illustrated article describes a steam-driven generating station at a brewery, where electric driving is adopted. The exhaust steam is used for heating purposes. (Page 240.)

THE first annual dinner of the Diesel Engine Users Association was held last week. It is hoped, by discussing difficulties, to assist the manufacturers to improve the Diesel engines. (Page 241.)

A PAPER on wireless telegraphy by Mr. H. Fothergill read recently before the North East Coast Institution of Engineers and Shipbuilders is referred to under "Telephony and Telegraphy." An entirely new system of telephone charges is under consideration by the Post Office. (Page 241.)

AMONG the Patent Specifications published last Thursday are two describing semi-indirect lighting fittings. A method of loom driving is patented by Siemens-Schuckertwerke, and other patents relate to lampholders, electric irons, and the ventilation of turbo-alternators. A B.T.-H. patent for remote-control high-tension switches expires this week. (Page 242.)

A PAPER by Mr. H. W. Firth discussed at last Thursday's meeting of the Institution of Electrical Engineers dealt with the influence of traffic conditions on electric traction.—Electric trains will commence running to-morrow on the L. & N.W. Rly.'s line from Earl's Court to Willesden.—The trolley omnibus service at Dundee is to be discontinued.—A new electric ticket machine has been installed by the District Railway. (Page 243.)

A NUMBER of new electric heating and cooking appliances are described in our trade section, including a novel "convection griller" with oil-immersed heating elements. (Page 244.)

EXTENSIONS are under consideration at Preston, and new mains are to be laid in Wolverhampton.—Tenders are invited for flame arcs, overhead tram equipment, carbons, and meters for Australia. (Page 247.)

THE L.G.B. deferred sanctioning a loan for Ashton-under-Lyne for future extensions in 1910 until more particulars were forthcoming, and in the meantime the Corporation has spent the money and is only now re-applying for sanction for the loan.—Two electric refuse carts are to be tried by the Birmingham Corporation.—The Manchester Electricity Committee will contribute £30,000 towards relief of rates next year.—The new Macclesfield electricity works are briefly described. (Page 248.)

**Fire at C. A. Parsons & Co.'s Works.**—It is reported that on Saturday a small fire occurred at Messrs. C. A. Parsons' Close Works, Gateshead. It is said to have been caused through the short-circuiting of an electric wire in the machine shop. A small portion of the roof was destroyed, but the damage was not considerable, and the fire was extinguished by the company's own employees.

## ARRANGEMENTS FOR THE WEEK

SATURDAY, MAY 2ND.

*Association of Mining Electrical Engineers.*

5 p.m. Yorkshire Branch. Griffin Hotel, Boar Lane, Leeds. Discussion on "Electric Winding."

THURSDAY, MAY 7TH.

*Iron and Steel Institute.*

10.30 a.m. Annual meeting at Institution of Civil Engineers.

FRIDAY, MAY 8TH.

*Iron and Steel Institute.*

10.30 a.m. Annual meeting continued.

**The London Electrical Engineers.**

Headquarters (46 Regency Street, S.W.) open Sats. till noon.

Rating Exam. for all Cos. from 7 to 10 p.m. every Wednesday.

Min. range each evening this week, 7 to 9 p.m. Musketry at Purfleet, Wednesday, May 5th, 1 p.m. to dusk.

(To-day) THURSDAY, APRIL 30TH, C. Co. FRIDAY, MAY 1ST, D. Co. MONDAY, MAY 4TH, A. Co. TUESDAY, MAY 5TH, B. Co. THURSDAY, MAY 7TH, C. Co. FRIDAY, MAY 8TH, D. Co.

**MANUFACTURE OF DRAWN WIRE TUNGSTEN LAMPS**

M B. J. W. HOWELL, in an article in the *General Electric Review* (Schenectady), on the Manufacture of Drawn-Wire Tungsten Lamps, gives some information as to the practical production of tungsten wire filaments. The raw material is a concentrated ore of tungsten, from which pure tungsten oxide, a fine-grained yellow powder, is obtained. This is "doped" and reduced to tungsten metal by hydrogen in an electric furnace. The product is in the form of a very heavy, rather coarse-grained grey powder, and is formed into ingots about  $\frac{1}{2}$  in. square and 6 in. long by transversely applied pressure, no binder being used. The ingot is then heated in a hydrogen-filled electric furnace to a white heat, and afterwards to near melting point, long enough to sinter the ingot, which now has a high lustre. The square ingot now goes to a swaging machine. It is heated to a white heat, taken out into the open air, and swaged. During this process a cloud of tungsten oxide rises from the ingot, which is reheated and swaged several times until it becomes a round rod 0.03 in. diameter and 80 ft. long. The rod first begins to have a fibrous structure, when the diameter is reduced to 0.06 in., but at 0.03 in. the fibrous structure is well developed; but the rod can be easily broken by bending it backwards and forwards once or twice. From 30 mils the rod or wire is reduced in size by hot-drawing through diamond dies. The wire is heated to a bright-red heat, and is still red-hot after passing through the die. This degree of heating is continued until the wire is only 3 mils in diameter, which is about the size of the filament in a 100-volt 100-watt lamp. Below this, the temperature of drawing is reduced and the last drafts are made cold, as the wire is now quite ductile. During this drawing the wire is lubricated with graphite—this prevents oxidation, as well as acting as a lubricant. For the final drawings a perfect die, which reduces the diameter only slightly, is used. By this means very long pieces of uniform diameter can be made. The filament in the 10-watt 100-volt lamp is only about 0.75 mil in diameter.

The filament-supporting arms were originally of copper wire in the smaller, and of tungsten in the larger sizes, but the use of copper is now being discontinued. The filament is wound on the supports by hand.

**Birmingham Local Section of the Institution of Electrical Engineers.**—The annual report records the holding of eleven meetings during the session, with an average attendance of 51. The membership of the section (including 93 students) is 437. The committee for next session will consist of the following: *Chairman*—A. H. Railing; *Past Chairmen*—R. K. Morcom, M. Railing, A. M. Taylor; *Vice-Chairmen*—W. E. Sumpner, J. F. Lister; *Ordinary Members*—S. T. Allen, G. Barnard, F. W. Carter, H. Foulds, C. C. Garrard, S. H. Holden, H. R. Hudson, A. Home-Morton, N. B. Rosher, F. W. Schiller, C. M. Shaw, T. F. Wall, A. Willmott; *Hon. Sec.*—J. D. Morgan.

**The Institution of Civil Engineers.**—Among the awards for Papers read and discussed during the session are a Watt Gold Medal to Mr. T. Clarkson for his Paper on "Recent Developments in Commercial Motor Vehicles," and Telford Premiums to Messrs. W. Willox and S. P. W. D'A. Sellon for their Papers on "Rail Steels for Electric Railways" and "Rail Corrugation and its Causes" respectively.

## THE INSTITUTION COUNCIL ELECTION

THE balloting papers for the election of the new Council of the Institution of Electrical Engineers will be sent out to-morrow. As already announced in our issues of April 2nd and 16th, six new ordinary members of Council have to be elected, and eleven have been proposed. The candidates are:—Prof. B. Hopkinson, F.R.S.; Messrs. G. W. Partridge, W. H. Patchell, W. Ll. Preece, G. S. Ram, W. Slingo, A. A. C. Swinton, W. B. Woodhouse, R. J. Wallis-Jones, John Christie, and Frank Ayton. The first six of these are the Council's nominees. The list of members nominating Mr. Wallis-Jones was published in our issue of April 16th, and Messrs. John Christie and Frank Ayton may be regarded as the representatives of municipal electrical supply interests. Although they have not actually been officially nominated by the M.E.A. Council, practically all their proposers are the members of it. Mr. Ayton's nomination paper has been signed by Messrs. A. B. Cramb, A. H. Seabrook, R. A. Chattock, H. Faraday Proctor, T. Roles, J. Christie, S. L. Pearce, W. Wyld, T. E. Edgcome, and C. S. Davidson. Mr. Christie's nomination paper has been signed by Messrs. W. W. Lackie, F. Ayton, C. Furness, A. S. Blackman, J. W. Beauchamp, S. J. Watson, E. E. Hoadley, F. M. Long, W. A. Vignoles, and H. Richardson.

**Wiremen's Strike in London.**—Mr. Leonard G. Tate, Secretary of the London Electrical Masters' Association, asks us to state that nothing has arisen necessitating any fresh action being taken by the Association, nor the calling of a meeting of members. So far as we have been able to ascertain, there are still a few wiremen out on strike in London, and a certain amount of picketing is still going on, but wiring work has been carried out continuously since the strike first occurred, and there is still considerable work in progress. About a dozen men of the Maintenance Department of the Marylebone Borough Council's Electricity Department came out on strike yesterday, on account of Mr. Seabrook's refusal to stop hiring labour from contractors who refused to sign the Electrical Trades Union agreement. The men in question are employed for the maintenance of motors, arc lamps, &c., and represent about half the number of employees engaged for this purpose. The meter reader who gave trouble a few weeks ago, has, we understand, joined the strikers. We are informed that other workmen have been engaged in place of the men on strike.

Selecting the Institution Council.  
An Embarras de Richesse.

## AN OVERHEAD ALUMINIUM NETWORK FEEDER

By E. P. Austin

CIRCUMSTANCES often arise where an additional feeder to an outlying portion of a network, possibly a residential district, is required to deal with short peaks, to meet the extra demands of a cooking load, or to form an additional means of supply in the case of a mains disconnection. Such conditions do not warrant a heavy outlay, and when tramway standards are in existence along the desired route, an overhead aluminium feeder erected on them makes a cheap and reliable job. The following details of a line recently erected to meet such conditions may be of interest.

Three aluminium conductors of size 7/0174, 7/0123, and 7/0174 respectively are mounted on petticoat insulators in the same vertical plane on the span-wire standards of an existing tramway system for a distance of 1,200 yds. They are connected at each end to the network of a three-wire supply system. The sag is 12 in. for a span of 120 ft., so that the factor of safety is 10, taking 2,000 lb. as the breaking strain of the hard-drawn aluminium strand. A feature of the construction is the arrangement made to "earth" the "live" conductors in case of breakage, as shown in Fig. 1 in two elevations. The neutral (bottom) conductor is connected solid to "earth" at the station switchboard only, and in order to maintain the neutral insulation of the network, and at the same time use the bottom conductor as a guard wire, porcelain strain insulators are used on the

FIG. 1.—GENERAL ARRANGEMENT OF CONDUCTORS AND GUARD WIRES.

FIG. 2.—CLAMP FOR EARTH WIRES.

"earthing" wires, which are also of aluminium. The method of clamping the earth wires to the neutral is shown in detail in Fig. 2, which makes a neat and sufficiently strong joint. Aluminium bonds are used throughout; in fact, no other metal is brought into contact with the aluminium except at the terminal poles, where special clamps are employed to connect on to the copper leads, taken out of the cable end boxes. The construction of earthing wires described was adapted from a design originally suggested by Mr. A. P. Trotter, of the Board of Trade. Horn break lightning arresters, in conjunction with kicking coils, are used at the terminal poles on each wire. The only means of disconnection are provided in the network at each end of the line. The end connections between aluminium and kicking coils are made by means of aluminium clamps in the form of cable lugs. The strand is first roughened with a coarse wire brush, and then coated with vaseline, and the contact surfaces of the clamp are similarly treated. When clamped up tightly the roughened surfaces penetrate the vaseline and make electrical contact, protected from the atmosphere by the vaseline. The finished joint is served with a coat of weather-resisting varnish.

The cost of such a job is very favourable, as shown by a comparison of the cost of copper and aluminium for the same equivalent area, which was £150 for bare, hard-drawn copper strand, against £95 for bare, hard-drawn aluminium strand. The cost of erection, insulators, brackets, &c., is the same for both systems.

## THE INTERNATIONAL ELECTROTECHNICAL COMMISSION

AT the Berlin meeting of the I.E.C., held in September, 1913, it was agreed that meetings of the (International) Special Committees should be held in Madrid towards the close of the present month. These Special Committees deal with symbols, standardisation rules for electrical machinery, nomenclature, and prime movers for electrical plant. It has, however, been found impracticable to hold these meetings at the present time, and they have, therefore, been postponed until the autumn. It is probable that they may take place in London. This extension of time will enable the National Committees to consider in detail the various proposals which will be discussed by the Special Committees, and it should have the additional advantage of thus simplifying the work of the delegates.

### An International Standard for Copper.

The Commission has now published its proposals for an international standard resistance for copper. Hitherto there has been a slight lack of uniformity in the values adopted in the different countries as the standard for annealed copper, sufficient to prevent the various national tables for copper wires being entirely comparable. These differences arose in the main from varying interpretations of Matthiessen's original work for the British Association Electrical Standards Committee, published in 1864. In order to help forward the establishment of an international standard, an investigation was carried out by the Bureau of Standards of Washington at the request of the American Standards Committee, and in May, 1912, certain definite propositions, based on the experiments carried out by the different National Laboratories, were considered by a Special Committee of the I.E.C. then sitting in Paris. These propositions were subsequently circulated to the National Committees of the I.E.C., and at Zurich, in January, 1913, they were agreed to in principle; Dr. Glazebrook, C.B., and Prof. Janet (of Paris) kindly undertaking to prepare the final wording of the different clauses in consultation with the Bureau of Standards of Washington and the Reichsanstalt of Berlin. The Report was ratified at the Plenary Meeting of the I.E.C. held in Berlin in September last, at which twenty-four nations were represented.

The resistance of a standard annealed copper wire of 1 sq. mm. section is given as 0.017241 ohm at 20° C.; the temperature-coefficient is given as 0.00393 per degree C., and the density as 8.89 grammes per c.c. Commercial copper is to have its conductivity expressed as a percentage at 20° C. of that of standard annealed copper. These data are given in various convenient forms with other information in the Report, which is English and French, and can be obtained from the General Secretary of the I.E.C., 28 Victoria Street, Westminster, S.W., for 2s. 1d., post free.

**A New Galvanometer.**—A new type of thermogalvanometer was described by Mr. F. W. Jordan in a Paper read recently before the Physical Society. The puff of air from an orifice in an air chamber when the air within is suddenly heated is utilised in this instrument to deflect a small suspended vane. The current to be measured is made or broken through a heater of small thermal capacity in the air chamber, and the outrush or inrush of air through the orifice delivers an impulse to the vane. The disturbing effects of extraneous heat and pulsations of external pressure are eliminated by a compensation method. In one instrument of this type the sensibility was 4 mm. per microwatt and the extremity of the throw of the vane was attained in 2 seconds.

**Home Office Prosecution.**—Last week, at South Shields, Messrs. Pyman, Bell & Co. were charged under the Factory Acts with contravention of the electrical regulations in having failed to cover certain overhead wires with insulating material or to safeguard them to prevent danger. The wires in question were supported 22 ft. from the ground on wooden poles across a yard used for storing pit props, and fed electrically-driven saws used for cutting the props to length. The case arose out of the death by electric shock of a man named Beck, who came in contact with these wires when working on the top of a stack of props 17 ft. high, the wires having sagged down somewhat. The facts were admitted, and a fine of £5 and costs were imposed.

**Northampton College Magazine.**—The April issue of the magazine of the Northampton Engineering College Day Students Union Society contains an article on theories of corrosion of iron and steel, and an interesting contribution on "Modern Aspects of Electricity and Matter," by Mr. A. C. Jolley. Abstracts of papers and lectures before the College Engineering Society are also given, and various humorous and other items complete a bright little publication.

## FREQUENCY CHANGING BY STATIC TRANSFORMERS

**I**N a Paper read yesterday before the Birmingham section of the Institution of Electrical Engineers, Mr. A. M. Taylor described a method which he has developed for obtaining currents at a higher frequency than that of the supply by the use of static transformers only. His Paper opened by referring to work done in the same direction by Joly, Vallauri, and Spinelli, the first two of which inventors convert a single-phase supply into one of triple or double its frequency respectively, while the last gives a single-phase triple-frequency current from a single-phase supply. All these methods depend in some way on distorting the supply wave away from the true sine form by utilising the difference in the behaviour of magnetically-saturated and unsaturated cores of the transformers forming different parts of the apparatus.

Mr. Taylor's method, however, converts from three-phase to single-phase. The principle on which it works will be understood from Fig. 1, which is drawn for one phase of the system only. The primary current is passed through a winding on a choking coil, *ED*, with a saturated core, which gives it the form shown in the curve *C*. This is passed through an unsaturated transformer, in which the flux responds to the distorted current wave, and in consequence two impulses of back E.M.F. are generated, one at the commencement and end of each half cycle of the fundamental electromotive force, thereby absorbing part of the fundamental electromotive force received from the mains at the instant, and pro-

FIG. 1.

FIG. 2.

ducing in its secondary an E.M.F. wave of partially complete triple frequency, as shown at *D*. By the use of all the three phases in this way the incomplete half waves of the three cycles come in rotation, so that their effect cancels out, and a symmetrical triple frequency wave is the result. In combining the three phases, the three saturated choking coils have separate cores, and are mesh-connected, but the unsaturated transformer has a single core carrying all the primaries and the single secondary, as shown in Fig. 2.

The Paper gives dimensions of a 28-kw. set under construction, and from experiments on a 7-kw. apparatus it is estimated that the efficiency of a 28-kw. set will be 86-88 per cent.; of a 100-kw. set, over 90 per cent., and of a 500-kw. set, 95 per cent. The 7-kw. apparatus was found to have a voltage regulation within 8 per cent.

The author looks forward to a field for the apparatus in competition with rotary-converter substations with three-phase low-frequency supply and single-phase two-wire distribution at a voltage and frequency suitable for lighting, and for enabling lighting to be taken conveniently from 25-cycle three-phase high-tension power-supply circuits. He also anticipates advantages for electric welding and metallurgical work, as any load may be put on the secondary without disturbing the balance of the three-phase supply. Again, in the case of a three-phase 16-cycle supply for railway work, current could be obtained at 48 cycles for station lighting. With slight modification, the apparatus could be made reversible, so that an existing 50-cycle system could give a supply at 16.6 cycles for special purposes. Another field in which the author suggests is wireless telegraphy. With a nine-phase supply from special machines, and nine choking coils with one working transformer, a nine-fold increase of frequency could be obtained, and the method could even be extended to give a 27-fold step-up in frequency.

## RAILWAY CARRIAGE LIGHTING

**A**T a recent meeting of the Illuminating Engineering Society there was a discussion on the Lighting of Railway Carriages and other Public Vehicles. In his opening remarks Mr. E. Kilburn Scott referred to the improvements effected in design and construction of metal filament traction lamps. On most underground railways they were now used—five 100-volt lamps in series. For steam train lighting the pressure was only 22 volts, so that lamps with thicker filaments were possible. The 10-c.p. lamps generally used had an efficiency of 1.3 watts per c.p., and had an average life of about 900 hours, i.e., until the candle-power fell to 20 per cent. of the original. When only a single source of light was used, some passengers received light from an inconvenient angle, so that it was better to have several lamps dotted over the roof, which should be of a dull white. Reflected light was better for reading by, as the rays did not strike the paper at such an oblique angle, and unless the lights were shielded the source of light was directly in the eyes of a person looking upwards, as when lost in thought. The semi-indirect system appeared suitable. For reading alone wall brackets and lamps shaded by concave reflectors were best, but unless some roof lighting was also employed the upper part of the carriage appeared dark. Indirect cornice lighting with tubular lamps might also be adopted—he believed the system was already in use on some Great Northern trains. It would be advantageous as regards lighting to have all carriage work unpolished, and both woodwork and upholstery somewhat lighter in colour than was the present practice in this country, and the ceiling matt white. Mr. Scott then referred to experiments which had been made in various countries as to lighting, and instanced a case in which the energy consumption was reduced from 1.62 to 1.31 watts per sq. ft., at the same time increasing the reading illumination from 2.71 to 3.24 ft.-candles by the use of appropriate reflectors and lamps of slightly higher power spaced further apart. It would appear that there was now little difficulty in obtaining a minimum of 2 ft.-candles 30 in. above the floor.

Mr. J. S. Dow mentioned that he thought that it was best to measure the illumination on a horizontal plane at the level of the knees of the passenger, as this served well for different kinds of carriages. He showed slides of different kinds of lighting in use at the present time, and summarised the question by saying that in railway carriages considered by railway engineers to be well lighted 1 ft.-candle at the level of the knees of the passenger would probably give nearly two ft.-candles when a newspaper was held in an ordinary position in front of the eyes. This was more or less the figure obtained nowadays, and was not far from the Library and School Committee's figures. For the lighting of electric railway carriages the illumination obtained in recent years was between 3 and 4 ft.-candles. In the latest carriages on the District Railway it was 7. The filaments, however, were not in many cases sufficiently screened. Professor J. T. Morris (East London College) thought that lamps should be three-quarters frosted or else suitable shades used. He believed that an illumination of about 3 ft.-candles was the best; 7 was too high. Mr. R. A. Ives then illustrated some fittings for vehicle lighting. Mr. V. A. H. Mackinney said that there was not sufficient height for semi-indirect and indirect lighting to be used. Mr. R. C. Bussell mentioned that people did not always want to read the moment they got into a public vehicle, and said that provision should be made for dimming the light. Mr. Leon Gaster said that electric lamps were now being properly spaced in omnibuses, and a good example was found on the Allen line. These buses had a very even illumination and no glare. The value was between 2½ and 3 ft.-candles. Mr. G. Campbell and Mr. E. Styles also spoke, and Mr. Kilburn Scott replied briefly. He said that the tendency to relieve the walls by means of good pictures was a step in the right direction, and should be encouraged. Properly illuminated advertisements were also a relief to the eye.

**Electric Driving of Textile Machinery.**—Mr. J. F. Crowley gave a lecture on this subject last week at Galashiels to an audience of Border woollen manufacturers, mill engineers, and others. He emphasised the advantages of electrical driving in doing away with quantities of shafting and permitting more economical transmission and arrangement of machinery under steadier speed, enabling increased output to be obtained. He discussed the relative merits of group and individual drive. Although he did not recommend individual driving for every department of a mill, he put a strong case for individual loom drive, and claimed that the production of a weaving shed could be increased as much as 50 per cent. by their adoption. He spoke of a case at Bolton, where the electrical equipment had paid for itself in nine months by increased production.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,389.

In a tramway station using three negative boosters connected at three different points of a common continuous rail return, and with no other connection to the rail, the station being some 2,000 yards from the tram track, the earth plates are fixed at the station; does this violate the B.O.T. Rules? If one of the boosters was connected with the wrong polarity, instead of sucking, what would happen? If one of the boosters broke down would it be advisable to cut it out and short across, bearing in mind the long length of return cable, over 2,000 yards,

Fig. 1.

and that the negative bar is earthed at the station? Is there any necessity to fit any protective device to protect the booster in the event of the circuit-breaker on the motor circuit acting and cutting out the motor, bearing in mind that the boosters are plain shunt wound and separately excited off the traction bus-bars? On what basis would you regulate the pressures of the three boosters? The ohmic resistance of the negative returns are all about equal, and are connected to one continuous rail.—"ELECTROLYSIS."

(Replies must be received not later than first post, Thursday, May 14th.)

### ANSWER TO No. 1,387.

The primaries of three single-phase transformers are connected up in mesh, and are supplied by a three-phase system. The secondaries, also connected up in mesh, feed a balanced, three-phase, non-inductive load. One primary phase is open circuited on account of an internal breakdown other than a short circuit. What must I do to maintain the supply, and what changes take place in the currents in each of the windings and in the currents in the live wires, assuming the load to remain unaltered?

The first award is given to "A.G.E." for the following reply:—

Should one of the phase windings of the primary become open circuited, practically no interference will take place in the supply, as the other two transformers will make up between them the deficiency by taking the rest of the load which was originally being supplied by the faulty transformer, themselves. For this reason it has been found advantageous in practice to use the delta connection, thus minimising the risk of a shut

down due to an open-circuited transformer. The chief trouble experienced when the V connection is used is that the impedance of the transformers produces an unbalancing of the primary currents and secondary voltages. As a result of one phase being open the other two phases will take an increased current of approximately  $\sqrt{3}$  times what they would take under normal

Fig. 2.

circumstances. That is if they took 100 amps. before the development of the fault they will now take somewhere near 173. This, of course, will mean a greatly increased copper loss per phase, and an overloading of the transformer if it had been working previously at near about its full capacity. The copper losses of one transformer will now be  $\frac{R(\sqrt{3})^2}{R \times 1^2}$  i.e., three times what it was before the fault occurred, and the total copper loss will be as 6 is to 3.

This increased copper loss will cause a reduction in the secondary voltages, and will necessitate a slight increase in the supply voltage if the secondary volts are to remain the same.

Transformers that are intended for use in such an emergency should have a combined rating of about 25 per cent. more than would otherwise be required.

To show the effect an open-circuited phase has on the system, I think the easiest way will be to consider what takes place in each phase of the supply separately. Imagine, therefore, three circuits which are as shown in the diagram AB, A'B', B'C', BC, and AC, A'C', and let V be the supply voltage, and  $I_{AB}$ ,  $I_{BC}$ , and  $I_{CA}$  the currents in the windings.

It will be seen by reference to Fig. 2 that you have current  $I_{AB}$  and  $I_{BC}$  flowing along the wires from BB to B'. Now imagine instead of two feeders from BB, CC, and &c., to B and C, one feeder in which precisely the same currents are flowing as you had before.

You then get the following relations, i.e.:—

$$I_A = I_{CA} - I_{AB}, \quad I_B = I_{AB} - I_{BC}, \quad I_C = I_{BC} - I_{CA}.$$

Now since BC is supplying B'A' and A'C' you will get a phase current less than you would otherwise get, since you have increased resistance losses. The result will be that the current flowing in two of the feeders will be somewhat less than  $\sqrt{3}$  times the phase current, as will be seen in the accompanying diagram. As a result of this you will unbalance to some extent the supply volts. A similar action takes place in the secondary circuit of the transformers producing an unbalancing of the voltages, and also the phase relationship.

The second award (5s.) is made to "A.G.R.," who writes as follows:—

In order to maintain continuity of supply the first thing to be done in such a case is to disconnect the faulty transformer. The remaining transformers will now be in V or open-delta con-

Fig. 3.

Fig. 4.

Fig. 5.

nection, as shown in Fig. 3. This arrangement will maintain the supply as before, and the line currents will be of approximately the same values (see below), as with the three transformers connected in delta. Fig. 4 shows the vector diagram for the

three transformers originally in delta, and Fig. 5 that for the two remaining transformers in  $V$ . By using different scales these diagrams will do for the H.T. or L.T. sides.  $V$  denotes line voltage, and  $I$  line current in each case. The power factor of the circuit will remain practically as before, i.e., unity. As the load remains constant, each of the two transformers in  $V$  will be overloaded 50 per cent., as there are only two instead of three units, and there will also be an internal phase difference between voltage and currents of 30 degrees in each transformer, as seen in Fig. 3. Therefore the load on each transformer, compared with the original normal load when connected in delta, will be

$$\frac{1 + 0.5}{\cos 30^\circ} = \frac{1 + 0.5}{0.866} = 1.73.$$

that is, each transformer will be overloaded 73 per cent., or the currents in the windings will be 1.73 times the original amount.

If the transformers were loaded to full normal output when connected in delta it is highly improbable that they will carry this overload of 73 per cent. for more than half-an-hour without heating up considerably.

The current in the middle lead of a  $V$ -connected bank of transformers with equal voltages impressed on all three phases should be slightly more than the current in the outside leads, on account of the fact that the drop in voltage across the open phase is, of course, slightly greater than across the closed phases; this difference in voltage between open and closed phases increases with decrease in power-factor.

The effect of leaving the L.T. side of the third transformer in circuit, with the H.T. side open-circuited, would be to maintain the iron loss in this transformer without any work being done.

### ELECTRIC POWER AT A BREWERY

THE application of electric power to the brewing industry requires the consideration of many special problems which are complicated by the question of steam heating. Every brewery must have a steam-raising plant for the supply of steam to heat the hot liquor tanks, and for grain drying. Indeed, the amount of steam required per hour is a dominating factor in the work of electrification. An interesting example is presented by the case of a large firm of Midland brewers who, finding the capacity of the old brewery insufficient, have made considerable extensions in the form of a complete new brewery, now nearing completion, to work in conjunction with the old. The old brewery possesses a small generating station, containing two gas engines driving bipolar continuous-current generators through belts. In addition, there is a small sub-station containing another gas engine and belt-driven bipolar continuous-current generator, with a combined full load capacity of 80 kw. at 230 volts, which is taxed to its utmost in the winter months. The new generating station is situated at the new brewery at about 300 yds. away from the old one, in a self-contained building, and

FIG. 1.—VIEW OF ENGINE ROOM.

generates sufficient power for both old and new breweries. Alternating current has therefore been adopted, and the general features of the generating station are as follows:—The engine-room, of which a view is given in Fig. 1, contains three compound steam-driven three-phase 400-volt Witton alternators of 200 kw. each, running at 428 r.p.m.; provision is also made in the station for the installation of an additional 500-kw. set. The main switchboard (Fig. 2) consists of three generator panels, six feeder panels, a voltage-regulator panel, and a spare generator panel. A constant bus-bar voltage is obtained by a voltage regulator. The lighting service is taken

from each phase and neutral at 230 volts. The boiler-house is equipped with three Babcock & Wilcox water-tube boilers, giving over 10,000 lb. of steam per hour. Dry saturated steam is supplied to the engines at 260 lb. per sq. in. From the engine the steam is exhausted into a super-heater passing on to the steam heating main. In order to maintain the purity of the steam for heating purposes, the engines have been designed to work without cylinder lubrication. The boilers are fitted with chain grate stokers, fed by an elevator and conveyor from a bunker at the end of the boiler-house. The stokers are driven through a worm-reduction gear by a 5-h.p. three-phase motor.

The feed-water is handled by two three-throw single-acting 25-h.p. motor-driven plunger pumps, the motors being designed to operate at two speeds. After being drawn from a softening tank, the water is pumped through an economiser, the scrapers of which are driven by a 3-h.p. motor. Coal is brought in trucks along a railway siding to the bunkers. After being elevated it is automatically weighed, and passes along by means of a scraper conveyor to the hoppers. The elevator, weighing machine, and conveyor are driven by a 12-h.p. pipe-ventilated motor situated above, and controlled from the floor.

The exhaust steam from the engines is conveyed along a long range of overhead piping, with special expansion bends supported on a gantry, which also carries the beer pipes from the old to the new breweries, a waste water-pipe, as well as water-supply for the fire hydrant and the feeder-

FIG. 2.—MAIN SWITCHBOARD.

cables. There is, in addition, a gangway running the whole length. This gantry will also be fitted with a scraper-conveyor to convey the coal from the dump about half-way along the range. This coal will be shovelled from the coal stores on to a sunken band conveyor, and carried to the foot of the gantry, where it will be elevated and conveyed along the top to the boiler-house, into a bunker, and then handled by the boiler-house conveying plant, the actual firing of the boilers being done with a minimum of labour.

For the internal wiring of the power-house, energy is brought from a feeder-panel from the main switchboard by three-core rubber-insulated cable laid under the engine-room floor in earthenware pipes. The power distribution board, which is one of the G.E.C. stepped pattern, is placed above the lighting distribution board, and away from the wall, so as to allow the lighting cable to go behind it. One circuit on the power distribution board feeds the lighting board, and the neutral wire will be noticed branching off the main feeder. The whole arrangement is perfectly watertight. The station, which is lined with glazed bricks, is lighted by lamps fixed direct to the girders high up on the ceiling.

In brewing work, although alternating-current machinery is more suitable than continuous, it is at some disadvantage when the plant to be driven needs an adjustable speed, as in a fair number of places in a brewery, and several alternatives are available for obtaining it. In this instance, the adjustable speed work is grouped, and the plant driven by continuous-current supplied by a motor-generator erected in the old power-house. This machine has a capacity of 105-kw. at 250-volts, and is capable of driving all the continuous-current plant required. The whole of the electrical plant for this scheme has been supplied and installed by the General Electric Co., Ltd., of Witton Works, Birmingham, and 67 Queen Victoria Street, London, E.C.

## DIESEL ENGINE USERS ASSOCIATION DINNER

THE first annual dinner of this Association was held at the Trocadero on Thursday, under the Presidency of Mr. J. E. Edgcome (Chief Electrical Engineer to the Kingston-on-Thames Corporation). The formation of the Association, something less than a year ago, arose out of a suggestion that users of Diesel engines might with advantage hold occasional formal meetings in order to discuss practical points and difficulties arising in the course of their work, but the idea has developed into something rather larger. At present the membership consists almost entirely of chief engineers of electrical power-stations in which Diesel engines are at work, but the rules permit of the admission of chief engineers of any works on which these prime movers have been adopted. To the Kingston-on-Thames Electricity Department belongs the honour of having installed the first horizontal Diesel engines in this country, and perhaps to that fact may be attributed the selection of Mr. J. E. Edgcome as the first President. (The engines were described in *ELECTRICAL ENGINEERING* for October 2nd, 1913, p. 552.) The long distances which separate Diesel engine users was responsible for there being a preponderance of guests at the dinner. These, however, were mainly manufacturers' representatives, upon whom the point was pressed that the Diesel Engine Users Association is not, as was on one occasion suggested, a body formed to secure better terms from manufacturers, and by the remarks of Mr. H. S. Russell (Messrs. Mirrlees, Bickerton & Day), Mr. G. Heath (Consolidated Diesel Engine Manufacturers, Ltd.), and Mr. J. M. Ferguson, all of whom responded successively to the toast of "The Guests," there would appear to be no misunderstanding between the makers and the Association on this point. On the other hand, whilst manufacturers are not eligible for membership, they are assured that their interests are well looked after by the respective users, who constitute themselves champions of the particular type they happen to adopt. Mr. Edgcome, in replying to the toast of the Association, called attention to the surprising ignorance regarding the possibilities of Diesel engines, not only in the lay mind, but in the minds of engineers. Many seemed to think, he said, that this engine is of quite recent manufacture, whereas the first experimental engine was built in this country twenty-one years ago. In England there are 450 engines, with a total horse-power of 86,000, whilst in other parts of the world there are 4,050 engines, with a horse-power of approximately 700,000. The chief cause of the retardation of the use of Diesel engines was the abnormally high price of fuel oil. The impossibility of obtaining gas tar oil of a uniform quality was also a deterrent to the increase in the use of Diesel engines, and these two points were matters which would be taken in hand by the Association. The very successful evening which was spent was admirably organised by the Hon. Sec., Mr. W. E. Brandreth, Chief Engineer to the Wycombe (Borough) Electric Light & Power Co.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A Paper outlining the present state of wireless telegraphy, by Mr. H. Fothergill, was read on April 23rd before the North-East Coast Institution of Engineers and Shipbuilders at Newcastle. After explaining the general nature of damped and undamped trains of waves, the author described the damped wave-spark system as used in Marconi stations employing the rotary disc discharger; in which the generating, oscillation, and radiating circuits are coupled to one another by transformers, and the discharger forms a shunt across the oscillatory circuit. The Telefunken system is generally similar, except that multi-gap plate discharger with no moving parts, giving a quenched spark, is used. The main object of both these dischargers is to cut off the spark immediately the energy in the oscillating circuit is first absorbed by the radiating circuit, and to prevent further useless surgings of energy in the former, while allowing the oscillations to continue in the tuned radiating circuit. Passing on to the generating of undamped or continuous oscillations, the Goldschmidt system, in which a high-frequency cascade alternator is used, and the Poulsen system, with its "singing" arc, were described. The relative merits of undamped and continuous waves were discussed, and it was mentioned that

the latter had so far only been employed for long-distance work experimentally. Turning to the reception of the waves, the Marconi magnetic detector, and the crystal detectors used in inductively-coupled circuits in the Telefunken and other systems were described. The Marconi Co. also use crystal detectors to some extent, and couple the receiving and detector circuits by an intermediate tuned circuit embodied in their "multiple tuner," which obtains good immunity from the effect of interfering waves. Some notes were then given on the British Imperial Wireless chain of stations. These will have duplicate plant, will employ waves from 15,000 to 50,000 ft. in length, and will contain plant aggregating from 1,900 to 2,500 h.p. The transmitting and receiving stations will be not less than ten miles apart in each case, and will be provided with balanced aërials to avoid interference. The transmitting stations will be operated so far as the actual sending of signals is concerned from the receiving stations by remote control. Short descriptions were given of typical maritime and military stations, and in conclusion the author said that the following were among the many problems still remaining to be solved:—Why is it that when using short waves, the distances covered at night are usually very much greater than those traversed in the daytime; whilst when using much longer waves the range of transmission by day and night is about equal, or sometimes even greater by day? What explanation can be given of the fact that the night distances obtainable in a north-southerly direction are so much greater than those which can be effected in an east-westerly one? Why is it that mountains and land generally should so greatly obstruct the propagation of short waves when sunlight is present, and not during the hours of darkness? These questions will no doubt be answered correctly after further investigations have been made, but at the present time it is doubtful if any of the many theories put forward are correct explanations.

It is stated that an entirely new scheme of telephone charges is under consideration by the Postmaster-General, together with other reforms, including an extension of the Metropolitan area, cheaper trunk calls, &c. It is understood that the distinctions between trunk and junction calls are to be rearranged on a more equitable basis. The details of the scheme will shortly be made public, and will be submitted to the various Telephone Advisory Committees before being finally put into force.

The *Evening News* is giving its assistance gratuitously to the Post Office to assist in improving the London Telephone Service, and from the announcement which it has published its services have been accepted. The scheme has been to ask all its readers during the week to send in specific complaints as to bad service, with full details. Our contemporary has recently been publishing a series of articles, evidently inspired by the Post Office, to demonstrate that a very large proportion of the bad service is due to the subscribers' own fault.

Successful experimental wireless communication is reported between Johannesburg and Durban, and from the Rand to ships at sea at a distance of 1,500 miles.

A site for a new Post Office wireless station has been chosen about three miles south of Stonehaven.

At the meeting of the Direct United States Cable Co., Ltd., it was stated that the Company's main cable had been interrupted twice in deep water since the lease was entered into with the Western Union Co., and they had inserted 425 miles of improved cable. Consequently, owing to the depletion of the reserve fund, the bonus would be withheld.

The Cayenne-Salinas cable of the French Co. was down again on the 22nd inst., and restored on the 24th inst.—On the former date telegrams for Vera Cruz were subject to delay, and were only accepted at sender's risk.—The Bagdad-Bassorah line failed on the 23rd, and was repaired on the 25th.—Albania now again admits private telegrams in code and cypher.—The Western Telegraph Co. published rates to Mexico, and are able to accept messages *via* Valparaiso at the rate to the Argentine Republic plus four francs a word for transmission beyond.—Rates were also published by the Emden route, but owing to the interruption of landlines near the Isthmus, telegrams can only be accepted at sender's risk by either route.—It is also possible to send telegrams by the Transatlantic cables and Panama.—Owing to censorship at Vera Cruz messages for British Honduras must be written in plain English or Spanish, and the contents must be rigorously neutral to Mexican interests.—The line between Coatzacoalcas and Tehuantepec being down, messages for Salina Cruz must be sent *via* Panama.—There is also delay in messages for Mexico *via* Galveston, and since the 27th inst. messages cannot be sent to British Honduras, no doubt owing to the interruption of landlines.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published April 23rd, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

**7,245/13. Semi-indirect Fittings.** H. WADE (*Schneider & Nautjoks Elektricitäts Ges.*). A single lamp reflector fitting is described in which the lamp is placed within an upper opalescent inverted bowl reflector, while under it is a glass bottom, the bowl-shaped middle portion of which, under the lamp, is opaque or opalescent, while the outer portion is of clear glass to transmit the light reflected downwards by the upper reflector. One figure.

**7,842/13. Loom Driving.** SIEMENS-SCHUCKERTWERKE GES. In this method of driving looms by electric motors, mechanical balancing, buffering or energy-storing devices are employed. These absorb energy twice during each revolution of the main loom shaft to retard the loom at those portions of the cycle of operations when the loom masses tend to overrun the motor. Six figures.

**8,124/13. Incandescent Lamps.** E. P. BECKWITH. In order to prevent heat losses, the filament supports are covered with a special non-conducting composition.

**13,063/13. Electric Irons.** F. S. RIPPINGILLE. The heating element in these irons consists of a tubular incandescent lamp in an ordinary holder screwed, by the thread which normally holds the shade ring, into a cavity so that the lamp is entirely within the body of the iron. One figure.

**14,170/13. Semi-indirect Lighting Fitting.** O. D. LUCAS and VERITYS, LTD. The large inverted reflector for the indirect portion of the lighting has a hole in its centre through which passes the neck of a single extra lamp used for the direct illumination, and this is surrounded by a small opalescent bowl attached to the main reflector. All the lamps are mounted on a fitting attached by a rigid rod to the ceiling, and the whole reflector system is hung on a counterweight arrangement so that it can be lowered clear of the lamps for cleaning. Four figures.

**14,941/13. Ventilating Electrical Machinery.** BROWN-BOVERI ET CIE. In this system of cooling turbo-alternators and similar machinery, longitudinal and radial ducts in the rotor co-operate with radial ducts in the stator, the latter being so divided that an air-stream can flow from rotor ducts to one division, and a further stream from the outer stator periphery to another division. Two figures.

**15,318/13. Lamp-holders.** G. ST. J. DAY. In this lamp-holder the contact plungers are not connected to the rest of the circuit until the lamp is pushed home, so that they cannot be live when there is no lamp in the holder. Five figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** A.E.G. [Lowering and braking connections for D.C. cranes] 5,529/13; DEBAUGE [Apparatus for manufacture of lead cable casings, &c.] 5,230/14.

**Dynamos, Motors, and Transformers:** WEINTRAUB [Vapour rectifiers] 6,353/14.

**Electrometallurgy and Electrochemistry:** HADDAN (*Internat. Ionizing Process Co.*) [Production of gases by means of arcs] 8,033/13; BREYDEL [Treatment of liquids with nascent ozone] 8,772/13; CANNING [Electro-plating] 17,603/13; SOC. GÉNÉRALE DES NITRURES [Aluminium nitride] 21,366/13.

**Ignition:** SPADA [Spark plug] 29,059/13.

**Incandescent Lamps:** BECKWITH, 8,123/13; WESTINGHOUSE METALLFADEN GLÜHLAMPENFABRIK GES. [Rendering metals and alloys ductile and malleable] 11,017/13.

**Instruments and Meters:** CIE. INTERNAT. D'ELECTRICITÉ SOC. ANON. [Meters] 11,825/13; SIEMENS DYNAMO WORKS (*Siemens-Schuckertwerke Ges.*) [Transformers] 2,492/14.

**Switchgear, Fuses, and Fittings:** R. BOSCH [Container of pressure regulated granular resistance] 28,824/13; LUNDBERG and PEGG [Switches] 29,721/13.

**Telephony and Telegraphy:** WESTERN ELEC. CO. (*Western Elec. Co., U.S.A.*) [Machine telephone switching] 5,653/13, 895/14, and 5,510/14; REBESI and HOLDEN [Telephone call apparatus] 8,412/13; HARRISON and AUTO. TELEPHONE MFG. CO., 26,479/13; WIDEGREN [Writing telegraphs] 29,242/13; SIEMENS & HALSKE [Telephony] 2,211/14.

**Traction:** MARKS (*Mascarenhas*) [Signalling and train control] 8,249/13.

**Miscellaneous:** GRAHAM and RICKETS [Order telegraphs] 5,648/13; MAY [Increasing strength of magnets] 7,898/13; CHADBURN'S (SHIP) TELEGR. CO. and HOWIE [Speed indicators] 7,994/13; LIGHT [Hosepipes for fire alarm installations] 9,396/13; THOMPSON and DAVIES [Magnetic separators] 9,725/13; CORSI [Jacquard machines] 10,373/13; CAMINATI [Thermoelectric current consumption-regulator] 17,947/13; HAY and SULLIVAN [Resistances] 21,109/13; BLOXAM (*R. Bosch*) [Condensers] 28,823/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Arc Lamps:** GIRARDEAU [Auto-regulation] 7,451/14; BLONDEL [Lighting by synchronised intermittent arc] 7,921/14.

**Distributing Systems, &c.:** SIGNAL GES. [Sub-aqueous electrical driving of machines using or generating hydraulic pressure] 7,821/14; DESPESAILLES [Lighting installations] 7,938/14.

**Dynamos, Motors and Transformers:** SIEMENS-SCHUCKERTWERKE GES. [Diminishing air friction of flywheel machines] 7,868/14; [Polyphase commutator machines] 8,258/14; SCHERBIUS [Transformers] 7,932/14.

**Electrometallurgy and Electrochemistry:** A. E. G. [Welding] 8,595/14.

**Ignition:** SPADA [Sparking plugs] 2,499/14

**Switchgear, Fuses and Fittings:** WEISSMANN [Tubular support for luminous signs] 7,311/14; HART [Switches] 8,038/14; MAX MATTHAEY & CO., GES [Plug connectors] 8,349/14; DRESLA [Time switches] 8,504/14.

**Telephony and Telegraphy:** CIE. FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON [Telephones] 5,640/14; KEMP and LAURITZEN [Transforming alternating currents into sound waves by resonators tuned to different frequencies] 8,021/14; COMER [Transmitters] 8,049/14.

**Traction:** CIE DE SIGNAUX ELECTRIQUES POUR CHEMIN DE FER [Signal control] 8,369/14 and 8,370/14.

**Miscellaneous:** HOLWERK [Cathodic detectors] 2,206/14; QUARZLAMPEN GES. [Mercury joint packing for vacuum vessels] 6,118/14; BENDEL GUSTAV [Soldering aluminium] 7,928/14.

The following Amended Specifications may now be obtained:—

**Ignition:** H. G. & W. W. LONGFORD and W. H. CLARK [Plugs] 20,207/11.

**Traction:** INTERNATIONAL P.A.Y.E. TRAMCAR CO. [Tramcars] 21,710.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

8,208 of May 3rd, 1900. **High-Pressure Switchgear.** B. T.-H. CO. (*E. M. Hewlett, U.S.A.*). The switch contacts are immersed in oil in a fireproof chamber. The bridging piece is worked by oil-pressure from a motor situated on the top of the chamber, and whose valves are controlled electro-magnetically. A long break is obtained and the fixed and movable contacts may be readily disconnected from the leads. When the contacts have been bridged the controlling magnet has a resistance cut into its circuit by the action of the switch.

8,274 of May 4th, 1900. **Blasting and Mining Fuses.** H. J. HADDAN (*Fabrik E. Zünder, Germany*). A flat insulating strip has each side coated with a conductor and a small piece of primary material is stuck on one end so as to connect the two coatings. Fuses of this kind can be very cheaply manufactured in quantity. A method of transport is also described.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** G. M. LITTLE [Flame lamps] 66/08.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H. CO. and WEDMORE [Automatic switches for feeder protection, &c.] 634 & 634A/07.

**Dynamos, Motors and Transformers:** J. G. V. LANG [Motor controllers] 329/03; M. WALKER [Power factor regulators] 693/09 and 29,376/09.

**Storage Batteries:** LEITNER, H. [Stoppers for cells] 517/07.

**Switchgear, Fuses and Fittings:** G. WEISSMANN [Electric signs] 321/09.

**Telephony and Telegraphy:** F. RITCHIE [Writing telegraphs] 455/04.

**Traction:** J. P. DURKIN [Controller time lag appliance] 14,073/06; K. W. G. J. STOFFELS [Electrically-actuated tramway points] 383/07; B. G. LAMME [Locomotives with resilient gear-drive] 28,634/07.

**Miscellaneous:** B. J. B. MILLS (*International Curtis Steam Turbine Co.*) [Steam turbines] 756/02; METALLURGISKA PATENT-AKTIEBOLAGET [Magnetic separators] 210/07.

## ELECTRIC TRACTION NOTES

The Paper by Mr. H. W. Firth on "Electrification of Railways as affected by Traffic Considerations," read at last Thursday's meeting of the Institution of Electrical Engineers, concluded the series which has dealt with various aspects of electric traction. The author dwelt upon the much greater difficulties which exist in the working of the mixed traffic of a section of a large railway, as compared with a tube railway or similar line. It was difficult to reserve rolling-stock for one kind of service only, and for electric traction a greater flexibility of speed characteristics was desirable. The author considered that true main-line business could not be profitably electrified at present as a rule, and there were a number of points to consider in order to get the best results out of electric suburban working. Difficulties were introduced by the necessity of running empty trains of cars, and to get the best results it might be necessary to run practically all the traffic within a certain distance from the terminus electrically. Unless the tracks for main-line and suburban working could be kept separate there was difficulty in arranging the short signal sections necessary for rapid service, and there were great limitations of frequency due to effects of crossings, flat junctions, and arrangement of terminal approach roads and platforms. About thirty trains per hour seemed to be the limit where there were flat junctions against the fifty which the District Railway hope to attain shortly. Consequently very heavy trains would have to be run which, with electric traction, had a greater effect on the capital cost than had an increase in frequency of light trains. The length of station stops had great influence on the problem, and in his opinion side-door coaches allowed shorter stops than corridor stock. Some interesting traffic curves of the G.E. Railway were given, showing the magnitude of the peak of the load in the morning and evening rush hours. The curves showed a "daily passenger load-factor" of 22 per cent., and this tended to get worse, as road competition affected the non-rush-hour traffic more than the rush-hour traffic. He suggested that it might be economical to only install generating plant to take about two-thirds of the peak load, and to run the remainder of the peak traffic by steam. This matter was gone into at some length, and estimated costs were given to show that it was feasible. It was suggested that the non-stop portion of the traffic was the most suitable for running by steam in this way. A number of interesting traffic curves of various railways were shown to illustrate the nature of suburban traffic under various conditions.

Mr. Firth's paper was well received in the discussion, but Mr. Roger T. Smith (Electrical Engineer, Great Western Railway) did not like the author's use of the word load-factor, and suggested utility-factor as preferable. The ideal was certainly to have separate tracks for suburban and main-line traffic, and several railways were tending in that direction. The feasibility of dealing with the traffic peaks by steam traction depended upon the comparative costs of steam and electric working under these conditions, and he thought that Mr. Firth's figures for steam were rather low. There were instances where non-stop traffic was run by steam, and stopping-trains electrically on parallel tracks. Mr. H. E. O'Brien (Lancashire & Yorkshire Railway) said that the conditions of electric traction enabled more traffic to be attracted during the non-rush hours. The sandwiching of steam and electric trains was only practicable when different terminal platforms could be used. He preferred corridor to compartment coaches for several reasons. Mr. H. Burge (Crompton & Co.) referred to a system of booster control of traction motors which has been experimented with in France (ELECTRICAL ENGINEERING, March 12th, page 148) by which it is claimed that as much as 25 per cent. can be saved in energy consumption, with only a 3 per cent. increase in the weight of the train. Mr. Bowden (Metropolitan Railway) thought that the chief fault of Mr. Firth's paper was that it did not show as strong a case as it might for electrical traction. He also thought that the author's comparison of costs was unduly favourable to steam. Part of the time of enforced idleness of the rolling stock during non-rush hours could be utilised for cleaning and overhauling in the sheds. In the case of the Metropolitan and District Railways, it was by gradually eliminating the limitations due to junctions, &c., that the present frequency of service has been built up. The growth of suburban traffic made electrical working a necessity, and due to the acceleration and hill-climbing power available, it was particularly adapted to dealing with flying junctions. The hollow in the generating-station load curve should be filled up by goods traffic and shunting. Mr. W. M. Mordey made a few remarks on the advisability of adopting methods of control other than those used at present for economising energy consumption. Mr.

Drury (Great Eastern Railway) also spoke, and Mr. Firth in reply commented on some of the points raised in the discussion.

As announced in last week's ELECTRICAL ENGINEERING, the electrical working of the Earls' Court Willesden Section of the L. & N.W. Railway is to commence to-morrow. As the new rolling-stock for the purpose is not ready, the service will be started with cars belonging to the District Railway. Drivers have been in course of training on the District Railway for some time. A fifteen-minute service is to be given. Pending the completion of the Company's own generating station at Stonebridge Park, current will be obtained from the sub-stations of the Great Western and District Railways. Work is progressing rapidly on the other sections which are being electrically equipped.

An automatic ticket-issuing machine has recently being installed at Victoria Station by the Metropolitan District Railway Co. It was designed and patented by the British Electric Automatic Machines, Ltd. (115 Victoria Street, Westminster), and performs the operations of printing, numbering, dating, and cutting off, of the tickets. The machine, which is set in action by depressing suitable levers, will print any of five different kinds of tickets, and is big enough to deal with ten kinds if required. The driving power is obtained through a chain drive, from a 6-h.p. direct-current, series-wound, 200-volt motor, which in turn is fed from the direct-current mains, which have a voltage of about 550, through resistances. The motor is of ample power, so that when the starting lever is depressed, full speed is rapidly attained. Automatic counters are fitted, so that the exact number of any particular kind of ticket which have been sold can be readily seen. The introduction of this machine is significant of the tendency to eliminate as far as possible the human element.

The moving stairways at Oxford Circus Underground Station are to be opened on May 9th. These are the largest that have yet been constructed, and will displace the lifts. Each has a vertical rise of 54 ft. and length of 121 ft., and 300 passengers can be carried at once. Each is worked by a 60-h.p. motor, and the two together can transport about 27,000 passengers per hour.

The London County Council Tramways and Improvements Bill, which, among other things, seeks powers to construct a loop in connection with the present Aldgate tramway terminus along Mansell Street and round Trinity Square, has been before a Select Committee of the House of Commons. There is opposition from the Port of London Authority and the Trinity House, and the Corporation of the City. It is not intended that all the cars should go round the loop.

It has been decided by the Dundee Tramways Committee to discontinue the running of the trolley-omnibus service along the Clepington Road. It appears that the traffic on the route has not come up to expectations, and the cars are objected to by the residents. The road is badly in need of repair.

The Stirling Town Council have declined the offer of Balfour, Battie & Co. to purchase the electrical undertaking and convert the present horse tramways to electric traction, and are investigating a scheme by arrangement with the Bridge of Allan Council and the Stirling and Bridge of Allan Tramways to institute a system of electric tramways between Bridge of Allan and Bannockburn.

The annual report and accounts of the Belfast City Tramways records a gross profit of £111,948, of which net revenue charges absorbs £60,527, leaving £31,352 to be transferred to sinking fund, £17,000 to depreciation, and £3,066 to general purposes fund.

The Blackpool Corporation Tramways report considerable increase in traffic, and a surplus on the year's working of £24,532.

According to the *Standard*, the Ontario Legislature has voted £1,000,000 for the construction of a Government electric railway system.

**Obituary.**—The death of Mr. Danckwerts, K.C., removes a notable legal personality, who was by no means unknown in electrical circles. An important electrical case in which the late Mr. Danckwerts was engaged was the dispute between the Leicester Corporation and the Electrical Contractors' Association, when the latter was successful in compelling the Corporation to close down its wiring department which the Chancery Court held was being carried on illegally. Mr. Danckwerts on that occasion appeared for the Corporation. A more recent occasion on which he came into prominence in the electrical world was in the Telephone Arbitration, in which he was one of the counsel for the National Telephone Co.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 247. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**LATHE TOOLS.**—A leaflet from the Motogear Engineering Co. (Brandon Grove, Ilford Hill, Essex), describes the "Eldrick" patent tool for parting off work in progress on the lathe, cutting tube, rod, &c. The tool is self-contained, and is fitted with a distance gauge, giving exact reproduction of length in repetition work.

**THE WEST HAM BULLETIN.**—The April issue of the West Ham Corporation Electric Service bi-annual Bulletin contains notes on the use of Edison battery delivery vans in the district, and an article on electric spot welding. Two cases are described where electric power has displaced steam driving on a large scale, and a further article describes electric furnaces for tool hardening and tempering.

**METAL FILAMENT LAMPS FOR MEDICAL PURPOSES, &c.**—The General Electric Co. (67 Queen Victoria Street, E.C.) have issued a new list of small size low-voltage Osram lamps suitable for various medical and scientific purposes, where they

have great advantages over carbon lamps on account of the smaller amount of heat produced. A number of standard patterns are listed, some of which are illustrated here, but the Company are always ready to quote for lamps made for special purposes.

**ELECTRIC HORNS.**—We have received from The Benjamin Electric Ltd. (1a Rosebery Avenue, London, E.C.), pamphlets describing the Dean Design Battery Horns and accessories. These horns are designed for both motor-car and motor-cycle use. The former operate on from 5 to 10 volts, the latter on from 4 to 6 volts. A five years' guarantee is issued with each horn. We understand that this type of horn has been made the standard equipment for the 1914 "Indian" motor-cycle.

### A NEW ELECTRIC COOKER

A NEW and very convenient form of electric cooker and stove, which is illustrated here, is being put on the market by Drake & Gorham, Ltd. The heating element consists of a glowing coil tube covered by a grid, and the apparatus reaches its full temperature in about fifteen seconds. It can

TABLE ELECTRIC COOKER AND STOVE.

be used as a toaster producing two slices in two minutes, or for heating frying pans, kettles, water-heaters, &c., or almost any ordinary utensil. The specially flat-bottomed vessels advisable with the disc type of boiling plate are not required.

The current-consumption (600 watts) is so low that the apparatus can be connected to an ordinary lamp circuit, and a special feature is the burnished brass heat reflector within the pressed steel frame. The heater only weighs 2 lb., and the diameter of the top is 7½ in.

### A CONVECTION GRILLER

WE enjoyed our lunch last Thursday. It consisted of fried sole cooked on a 500-watt Venner convection griller, kidneys and bacon cooked on the same griller, asparagus steamed over a Venner electric oven, an omelette cooked on the same convection griller, bread and cheese straws made in the oven, and coffee from water boiled in a Venner kettle with immersion heater. All was excellent, and the sole, kidneys and bacon, and omelette were cooked in front of us in the small room in which we dined, and yet, remarkable to relate, there was no "smell of cooking."

The food on the griller was cooked directly on the top plate of the apparatus—without the interposition of any other cooking utensil, even for the omelette. It took five minutes to bring the griller up to heat, and to melt the fat for the sole to be cooked in, and a quarter of an hour more to cook the sole (an animal weighing 1¼ lb., and amply large enough for the three of us who were lunching). While we were eating the sole, the top plate was cleaned off, and the kidneys and bacon were then cooked in ten minutes, and the process was repeated with the omelette, which took five minutes only to prepare.

The griller is shown in the illustration below. It differs from other electric cooking utensils by heating the hot-plate

only by convection instead of by radiation. In consequence, the heat is absolutely uniform, and applied only where it is wanted. The apparatus stood on a polished wooden table, the surface of which was not even made perceptibly warm.

The heating coils are of nichrome wire wound on micanite strips, and they are immersed in a special oil with a flash point of about 670°F.; there is about ¼ in. of oil between the wire and the bottom of the plate, which is therefore heated by convection currents of hot oil. As seen in the illustration, the plate is about ½ in. deep, so that a dish is formed in which the things are cooked, and the plate is coated with a high oxide of iron which gives a hard blue-black surface easy to clean and always free from rust. There is only one pair of terminals, and the one heat is sufficient; owing to the small quantity of heat required to heat up the small volume of oil above the coils, the plate attains its high final temperature very quickly, and the absence of smell was explained to us as being due to the immediate contact between the food and the high temperature hot-plate which quickly seals the pores of the fish or meat, which retain the juices. The terminals are pins surrounded by an insulating compound retained in a metal collar, and the coefficient of expansion of the compound and the metal are the same, so that there may be no leakage of oil. A valve is provided next to the terminals to let off any vapour which may rise from the oil in the event of a severe short within the apparatus. The griller measures 13½ in. by 10½ in. We were also shown a smaller one, of circular shape, 9 in. in diameter, which takes about 400 watts.

The rating of the Venner oven is also extremely low for the work it does. In this the coils are not in oil, but are placed all round the oven (which is cylindrical) between a

black and bright metal plate. A steamer for vegetables fits on top of the oven. The oven takes 1,300 watts only, and a hot cupboard beneath it 150 watts. The oven itself is 15½ in. internal diameter and 20 in. high, and will take a 12-lb. joint.

The apparatus described is expected to be on the market in a few weeks' time; the manufacture has commenced. Mr. R. F. Venner and Mr. B. G. Battson, who is associated with him in the development of the apparatus, have had it in successful use in their own houses for two years, and have effected economies of 50 per cent. in the cost of cooking (in Mr. Battson's case at 2d. per unit), compared with the previous cost of gas cooking.

There is no doubt that the low voltage and easy applicability of the Venner cooking apparatus will recommend it to many of those central station men who have hitherto held back from developing electric cooking, owing to the limited size of their distributing mains.

A new company, Venner's Electrical Cooking & Heating Appliances, Ltd., has been formed for the supply of the apparatus, and has fitted a combined kitchen and dining-room at its offices in Walter House, at the corner of the Strand and Bedford Street. This is fitted with two ovens and three grillers, all placed on a glass-topped dresser.

### MOIST HEAT ELECTRIC FIRES

THE illustrations show an improved form of electric fire introduced by the Altheat Co., Ltd. (62 Oxford Street, London, W.). It is claimed that these fires give out a soft

FIG. 1.—SECTION OF HEATER.

run at either half, three-quarter, or full load. Owing to the fact that the heat-absorbing and radiating power of moist air is many times greater than that of an equal amount of dry air, the heating effects of this type of stove are claimed to be

FIG. 2.—"FIALITE" STOVE WITH COVER REMOVED.

more marked than where stoves of the ordinary dry air type are used. The general finish of the Altheat electric fires is distinctly artistic. We are informed that the prices compare very favourably with those of other types.

### THE SPREAD OF ELECTRIC HEATING AND COOKING

WE reproduce here one of a pair of photographs which have been sent to us by Mr. A. H. Seabrook, General Manager, Borough of St. Marylebone Electric Supply, which may be regarded as interesting signs of the times. We do remember having seen contractors' notices on electric cooking installations before. The building illustrated is a large block of flats. The other view is also of a block of flats under construction, and the legend runs:—To Let, Luxurious Flats.

A CONTRACTOR'S BOARD IN MARYLEBONE.

All the Latest Labour-saving Inventions, Lifts . . . Cleaning Apparatus . . . Cooking (Electric Cooking Stoves), &c. The latter block has been built by Mr. Charles Lee, one of the large Marylebone consumers, and the well-known Willesden magistrate. Mr. Seabrook points out that the photographs illustrate the strides that electric heating and cooking have made, and that we shall soon be able to say that their advantages are as well-known to the public as those of electric lighting.

### AN ELECTRIC WATER HEATER

A NEW water-heater for giving a continuous supply of hot water for domestic purposes has been introduced by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.). One of these, of the 10-gallon size, is illustrated here. Through the open door can be seen the heating element, which is in reality a small pocket for water with low loaded elements mounted on either side. In the case of the 10-15 gallon tank, this element is only loaded to 300 watts. On either side of this pocket or circulator will be seen a stop-cock; the idea of these stop-cocks being that water may be turned off from the circulator, and the circulator may be removed bodily from

"PLEXSIM" HEATER FOR CONTINUOUS HOT WATER SERVICE.

the tank without interfering in any way with the tank or the plumb connections. The water container consists of an inner tank made of tinned copper, around which is 1½ in. of slag wool or other lagging. There is a hinged lid covering the whole body, so that the inside of the tank can be readily cleaned. This lid is also lagged, as is the inspection door to the circular chamber. As water is constantly passing through the circulator, the water in the main body is slowly raised in temperature. Starting from "all cold," it will take a considerable number of hours to get the water to a tempera-

ture of, say, 150–180° F., but when this temperature is once reached the lagging of the tank prevents much loss, and it will be found in actual practice that with the current switched off at, say, 6 o'clock at night, the fall in temperature is not more than from 20 to 40°, depending upon the season of the year. As a consequence, when the current is switched on in the morning it does not take long for the temperature again to pick up to the 150–180° F., which is an ordinary hot water temperature. If it is convenient to leave the apparatus in circuit day and night, the loading can be slightly less.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Ardee.**—Mr. J. W. McKeever, of Aclare Lodge, has been given permission to erect poles and cables on the public road to enable him to light Ardee with electricity. He has also arranged to light the town of Collon.

**Armagh.**—The question of lighting the town by electricity is engaging the attention of the U.D.C.

**Australia.**—The Sydney Municipal Council invite tenders for arc lamp carbons, meters, and maximum demand indicators. Tenders by July 20th. Copy of specification may be seen at 73 Basinghall Street, E.C.

**Ballaghaderreen.**—The Castlerea District Council has applied to the L.G.B. for sanction to a loan of £1,263 for the provision of additional generating plant for the electric lighting of Ballaghaderreen.

**Loughrea (Ireland).**—The Loughrea Electric Supply & Lighting Co., which is a newly-formed company, is about to put down a small generating station, and the Town Commissioners have accepted its offer to light the streets from September to May with forty-three lamps of 50 and 100 c.p.

**Preston.**—It is proposed to appoint a Sub-committee to consider the necessity for extensions.

**Sweden.**—According to a Belgian Consular Report, the demand for electrical fittings in Sweden is greater than can be supplied by the Swedish manufacturers; at present Germany is foremost in the market.

**Wolverhampton.**—Mains extensions at an estimated cost of £1,575 are contemplated.

### Wiring

**Blackpool.**—The Corporation has sent to Paris to get new ideas for electrical illuminations which will be a special feature of next autumn season.

**London.**—St. Matthew's Church, West Kensington Park, is to be electrically lighted. Rev. F. B. Marsdin, Vicar.

**Wolverhampton.**—Firms desirous of tendering for the electric lighting of Walsall Street school are invited to send their names to the Secretary, Education Offices, Town Hall, not later than May 12th.

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Accrington.**—Cinematograph theatre, Whalley Road.

**Broadstairs.**—New school for 320 scholars, for Kent Education Committee. Architect, W. H. Robinson.

**Bury.**—Cinematograph theatre, Bury Bridge.

**Darwen.**—Fourteen new houses in the Anchor district.

**Denbigh.**—New market, public hall, fire brigade station, and offices.

**Folkestone.**—New band pavilion. Town Council.

**Gateshead.**—Secondary school for Education Committee. Architect, W. F. Purser, 10 West Street.

**Glasgow.**—Glasgow South Side Telephone Exchange. H.M. Office of Works, Storey's Gate, London.

**Great Harwood.**—New weaving shed. Premier Mill Co.

**Heywood.**—New mill. James Byrom, Bury.

**Huddersfield.**—Thirty workmen's dwellings in Meltham Road. Town Clerk.

**Ipswich.**—Extensions at Borough Isolation Hospital. Architect, H. M. Cautley, The Thorofare.

**Kilmarnock.**—Extensions at infirmary.

**Manchester.**—New industrial school at Cheadle Heath.

**Seaton.**—School for Cumberland Education Committee. Architect, J. Forster, 13 Earl Street, Carlisle.

**Tyldesley.**—New variety hall, Shuttle Street.

**Wallasey.**—New fire station. Town Clerk.

**Wrexham.**—Girls' County school. Architect, W. D. Wiles.

## Miscellaneous

**Australia.**—The Victorian Railways Commissioners invite tenders for 100 series enclosed flame (long burning) arc lamps for the Melbourne Railway Yard. Tenders by May 13th.

The Adelaide Tramways Trust requires miscellaneous equipment for overhead trams. Tenders by May 26th.

The above information is of use only to firms with Australian agents to whom they can cable. Copies of the specifications and form of tender may be seen at 73 Basinghall Street, E.C.

## TENDERS RECEIVED AND ACCEPTED

**Arbroath.**—The tender of Messrs. Underhill & Ritchie, of Glasgow, has been accepted for lighting the Parish Church.

**Blackpool.**—The contract for six open-type bogie cars has been given to the United Electric Car Co.

**Norwich.**—The D.P. Battery Co.'s tender has been accepted for supplying and erecting 252 L21 type cells for £840, with free maintenance for one year, and maintenance at £83 4s. per annum for the succeeding nine years, subject to the L.G.B. sanction to the loan.

**Rawtenstall.**—Messrs. Babcock & Wilcox's tender has been accepted for water-tube boilers. Other firms tendering were the Stirling Boiler Co., Clarke, Chapman & Co., the Howden Boiler Co., and T. Beeley & Sons.

**Erratum.**—Siemens Bros. Dynamo Works inform us that, owing to a clerical error, the contract for lamps for the Belfast City Corporation Tramways was wrongly stated as having been awarded for the Bristol Tramway.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £65 10s. to £66. (Last week, £66 10s. to £67.)

**Bankruptcies, Liquidations, &c.**—The Leicestershire & Warwickshire Electric Power Syndicate is to be wound up voluntarily. Mr. T. W. Holland, 84 Coleman Street, E.C., is liquidator.

The public examination in the bankruptcy of W. H. Pease (Scarborough) will be held at the County Court Hall, Bank Street Lane, Sheffield, at 2 p.m. on May 14th.

The liquidator of the Davis Electrical Co. has been released.

**Change of Telephone Number.**—The telephone number of the Langdon-Davies Motor Co. has been changed to City 2744 (2 lines).

## APPOINTMENTS AND PERSONAL NOTES

Mr. J. A. Robertson, who is leaving Greenock for Salford, has been appointed Consulting Engineer to the Greenock Corporation until the completion of the extension works to Port Glasgow. A Sub-committee has been appointed to confer with Mr. Robertson in connection with the vacancy for a successor.

Mr. S. Trow Smith, Engineer and Manager of the Gas Department of the Leek U.D.C., has been appointed Gas and Electrical Engineer at Malvern at a salary of £350 rising to £400. The other names on the short list were published in our last issue.

Mr. H. P. Stokes, Electrical Engineer and Tramways Manager to the Bexley Urban District Council, has had his salary increased by £100 per annum.

The salary of Mr. C. Garnett, Borough Electrical Engineer at Darwen, has been increased by £50 a year.

Mr. Charles Lill, Sales Engineer of the Hackney Electricity Department, has resigned on securing another appointment.

Applications are invited for the post of Head of the Engineering (Mechanical and Electrical) Department at the Ashford Technical Institute. Applications to the Director, Technical Institute, Folkestone.

## LOCAL NOTES

**Accrington: Extensions.**—A L.G.B. inquiry has been held into an application to borrow £33,530 for the extension of the electricity works. This will be devoted to duplicating the new gas-engine plant. A loan period of seventeen years is being sought for £28,000 to be spent on plant and foundations, and thirty years for the remaining £5,000 for buildings.

**Ashton-under-Lyne: L.G.B. Inquiry.**—There was a passage at arms between the Town Clerk and Mr. H. Ross Hooper, the L.G.B. Inspector, at the inquiry last week on an application for sanction to a loan of £53,476 for extensions. Of this £34,924 was part of a sum applied for in 1910 for future extensions, for which, however, sanction was withheld for further particulars. The matter had, however, been allowed to rest until now, and in the meantime there had been an overdraft on the electricity account of £35,463. Mr. Hooper complained at having to go into the matter again after four years' delay, and also objected to local authorities spending money on extensions before the loans were sanctioned.

**Birmingham: Electric Refuse Carts.**—Two electric battery vehicles are to be supplied by the Electricity Committee at a cost of about £550, for the removal of street refuse.

**Blackpool: Electricity Accounts.**—The consumers have increased from 2,100 to 2,461, and the maximum demand from 3,179 to 3,600 kw. Five and a half million units were generated, an increase of 685,000 over last year. Fifty per cent. of the increased output has been for residential lighting.

**Bournemouth: Electric Cooking.**—The Bournemouth & Poole Electricity Supply Co. are doing their utmost to improve the heating and cooking load, and gave successful demonstrations of electric cooking at Havergal Hall from Tuesday to Saturday last week.

**Bristol: The International Exhibition.**—A very complete lighting scheme has been arranged for the lighting of this exhibition, which is to open at Ashton Gate on May 28th. About five miles of special mains will be laid by the Corporation, including a cable which will be laid by divers across the river, and anchored down in trenches which will be allowed to fill up. The supply will be at 6,000 volts, transformed at a sub-station to 365 volts for power and 210 volts for lighting. The cable laid for the exhibition will be afterwards utilised for supply of districts which might otherwise have to wait long for a supply. The exhibition has guaranteed a minimum consumption of current costing £6,000. Elaborate decorative lighting and illuminated cascades will be features of the scheme.

**Girvan: Electric Lighting Proposal.**—Messrs. Purves, consulting engineers, of Edinburgh, have asked the Council's permission to their obtaining a Provisional Order.

**Golcar: Peculiar Application for Bulk Supply.**—The Clerk to the U.D.C. has asked Mr. A. B. Mountain, Borough Electrical Engineer at Huddersfield, upon what terms the Corporation would supply electricity in bulk if the Council could distribute the supply. Mr. Mountain has replied that the Corporation has already powers to supply in Golcar itself, and has a large number of consumers.

**Lowestoft: Exhibition.**—An "Electrical Home" Exhibition has been held at Lowestoft. The Corporation had an interesting exhibit of various domestic applications.

**Manchester: Large Contribution to Rates.**—The net surplus on the electricity undertaking has risen from £28,331 to £36,760 for the year, which is an increase of £7,260 over the estimate. The units sold have increased from 104,000,000 to 117,000,000. The estimates for the forthcoming year are 130,000,000 units, but the Committee does not expect the surplus to increase proportionately until the new capital outlays are fully productive and the coal prices are easier. £30,000 has, however, been earmarked for the contribution to relief of rates, as compared with £28,500 last year.

**Macclesfield: Diesel Engine Station.**—As mentioned in our last issue, the Macclesfield electricity supply was inaugurated on Saturday, April 18th. The engine-room contains two 160-kw. Diesel sets. The engines are by Hick, Hargreaves (Bolton), and are of the vertical, three-crank type, running at 250 r.p.m., and driving General Electric Co. (Witton) D.C. generators. The switchboard was also supplied by the G.E. Co. A battery of Tudor cells, with a capacity of 570 ampere-hours at the 10-ampere rate, a three-wire booster, and a compound-wound balancer complete the equipment. The distribution is 2 x 230-volt three-wire, with Pirelli three-core, paper-insulated, lead-covered, steel-armoured cables.

**Oldham: Suggested Free Supply.**—The Electricity Committee has received a deputation from the Oldham Royal Infirmary begging them to supply electricity either free of charge or at a specially low price. It appears that the Gas and Water Committee have allowed concessions of this nature, but it is extremely doubtful whether the Electricity Committee can legally do so.

**Penketh: A "Contiguous Area."**—The Parish Council of Penketh, which is in the area of the Lancashire Electric Power Co., desires to obtain electric supply. The Lancashire Power Co.'s mains do not extend to there, but the Warrington Corporation is willing to supply Penketh, and the Power Co.'s permission to this is being sought.

**Queenstown: Public Lighting.**—The Gas Company proposes to raise the price for street lighting. The Council has decided that electric lighting would now be cheaper, and will install it if the Gas Company refuses to adhere to the old rate.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Calcutta Tramways Co.**—In spite of an increase of £10,000 in traffic receipts the expenditure has decreased by £6,523. A dividend of 7s. per share has been declared, making a total of 9½ per cent. for the year.

**Johnson & Phillips.**—As reported in our last issue, the net profit balance for the year was £12,755, which it is proposed to carry forward. At the meeting last week, in reply to a complaint that there was no dividend, the Chairman said that the Board regretted this as much as anybody else, because it was an open secret that the directors held nearly five-sixths of the total shares and stock.

**London Electrical Trading Co.**—Dr. H. Charlton Bastian, F.R.S., presiding at the adjourned second ordinary general meeting of the Company held on the 9th inst., said that the turnover for the sixteen months ending October 31st, 1913, had been more than doubled as compared with any previous sixteen months. In order to establish the position of the Company in many markets, it had been necessary to accept low prices in the first instance, and consequently the net profits were small in proportion to the turnover. The payment of a dividend of 4 per cent. on the ordinary shares was approved. Rear-Admiral the Commendatore Persico, R.I.N., was re-elected a director of the Company.

**Woking Electric Supply Co.**—At the recent annual general meeting, a statement was made with regard to supply to Chobham. It appears that there is a demand for a supply in Chobham Village, which is in the Ascot Company's area, but this company is unable to supply them, and so far has not consented to the Woking Co. coming in, although it only means the extension of the mains by a few yards. This seems to be a case in which an application to the Board of Trade for consent should be successful.

## NEW COMPANIES

**VENNER'S ELECTRICAL COOKING & HEATING APPLIANCES**, 6 Old Queen Street, Westminster. Capital £100,000. To carry on the business of manufacturers of, and dealers in, electric heating and cooking devices, and to adopt an agreement with R. F. Venner.

**PREMIER VALVE LTD.**, electrical and mechanical engineers, 54 New Broad Street, E.C. Capital £1,500. Private company.

**TRANSISO SYNDICATE**, 68 Cowcross Street, E.C. Manufacturers of and dealers in electrical appliances, &c. Capital £40,000.

**TUBEX ENGINEERING CO.**, 55 Victoria Street, S.W. Capital £5,000. Electrical and mechanical engineers. Registered by Jordan & Sons.

**ARGENTINE ELECTRICITY CO.**, 62 New Broad Street, E.C. Capital, £45,000. Objects as title.

**A. W. BEUTTELL, LTD.**, 109 Victoria Street, S.W. Capital, £10,000. To take over the business of electric light and power engineers carried on by A. W. Beuttell at 203 Victoria Street, S.W.

**CHIPPING NORTON ELECTRIC SUPPLY CO.**, 50, Cannon Street, E.C. Capital £10,000. To take over the business of the present company, and to adopt an agreement with W. H. Schultz.

## SUMMARY

WE announce with regret the death of Mr. Robert Kaye Gray last week. (Page 250.)

THE Institution of Electrical Engineers has issued its revised edition of the model general conditions which are understood to be in line with the views of the B.E.A.M.A., but have not been agreed to by the I.M.E.A. (Page 250.)

ALL the boiler hands at the Smethwick power house of the Shropshire, Worcestershire, and Staffordshire Electric Power Co., struck work at 10.30 a.m. on Monday last week, without notice. They were immediately replaced and have not been re-engaged. Steam was maintained. (Page 250.)

IN his report on the Senghenydd colliery disaster, Prof. Redmayne attributes the explosion either to sparks from the electric signalling apparatus or from rocks brought down by a fall, and quotes experiments showing that a mixture of gas and methane of a particular strength can be ignited by sparks from a 4.5 volt bell circuit, contrary to certain evidence given at the inquiry. He points out that the signalling installation was not in accordance with the present regulations, but owing to the date of its construction was exempt from them. Mr. Evan Williams dissents from Prof. Redmayne's view, and is of opinion that the ignition cannot have been electrical. (Page 251.)

A PAPER by Mr. L. Rothera, read before the Institution of Mechanical Engineers, dealt with the application of electric driving to existing rolling mills, and emphasised the advantages of electric power. (Page 252.)

A REPAIR to a shaft cable is described in a paper by Mr. F. Smith, read recently before the Association of Mining Electrical Engineers. (Page 252.)

SEVERAL additional types of electric safety lamps have been approved by the Home Office. (Page 253.)

SOME new flame-proof mining circuit-breakers and switches are described in an illustrated article. (Page 254.)

AN abstract of a Paper read before the Association of Mining Electrical Engineers by Mr. J. A. Kerr, Natal, deals with the maintenance of electrical plant in collieries. Some of the troubles met with are mentioned, and remedies are suggested. (Page 254.)

MR. BEADSMOORE, in a Paper on fault testing, insists that the colliery electrician must have proper instruments for locating faults in addition to the usual "Megger." (Page 255.)

A PAPER by Mr. J. Glynn Williams, read before the Association of Mining Electrical Engineers, referred to a number of practical points in connection with mining electrical equipment. (Page 255.)

A NEW electrical signalling system for mines is described. (Page 256.)

AMONGST the patent specifications published during April were several dealing with magnetic separators, safety lamps, and signalling apparatus, which are of special interest to mining engineers; also a few of interest to metallurgists, including one describing the preparation of very finely divided copper, and another treating of a process of ore smelting by the use of eddy currents. (Page 257.)

THE connections of leakage indicators for mines are discussed in our Questions and Answers column. (Page 257.)

AT the last meeting of the "Point Fives" an address dealing with experience with different types of electric cooking apparatus by Mr. J. W. Hame was read. Several well-known central station engineers joined in the discussion. (Page 259.)

THE annual dinner of the Electrical Contractors Association was held at Leicester on Wednesday last week. (Page 259.)

A RECENT tramway accident at Rochdale is attributed by the Board of Trade inspector to excessive speed. (Page 259.)

SUCCESSFUL experiments are reported with the new Marconi wireless telephone.—The purchase by the Corporation of the plant of the National Telephone Co. at Hull which had been taken over by the Post Office has been completed. (Page 259.)

A LAPSED PATENT for a fire indicator for ships has been restored by the Comptroller. Specifications published last week include a method of increasing the strength of magnets, an automatic safety device for trains, a process for the preparation of ductile tungsten, and improvements for automatic telephone systems.—Some of the specifications published to-day relate to

high-frequency generators, electric furnaces, switches, telephony, and wireless.—Amongst the expired patents is one for a combined switch and cut-out for H.T. lighting systems which has had a life of eleven years. (Page 260.)

In our Trade Section will be found descriptions of some new semi-indirect fittings and a new electrical advertising device. (Pages 261 and 262.)

OUR list of tenders invited and prospective business shows that considerable activity may be expected during the next few months. Among the towns requiring new plant and mains are York, Rotherham, Devonport, Lytham, and West Bromwich. (Page 263.)

THE Manchester Corporation Bill for purchasing the Trafford Park electricity undertaking is occupying the attention of the House of Lords Committee.—The Board of Trade has granted the Bury Corporation power to supply Heywood in bulk, in spite of the opposition of the Lancashire Power Co.—A portion of the profit of the Coventry electricity department has been allocated to giving a bonus to the employees.—New 1,000 kw. extensions have been inaugurated at Dewsbury, and a 3,000 kw. set has passed its official tests at Aberdeen. (Page 264.)

### ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MAY 7TH.

*Iron and Steel Institute.*

10.30 a.m. Annual meeting at Institution of Civil Engineers. FRIDAY, MAY 8TH.

### The London Electrical Engineers.

Headquarters (46 Regency Street, S.W.) open Sats. till noon.

Rating Exam. for all Cos. from 7 to 10 p.m. every Wednesday.

Min. range each evening this week, 7 to 9 p.m. Rating Exam. all Cos. Wednesday, May 13th. Also annual course of musketry at Purfleet for all Companies.

The Corps Sports will take place at Duke of York's Headquarters on Saturday, May 9th, at 3 p.m.

Musketry Practice, Purfleet Rifle Range, Saturday, May 16th, 1 p.m. till dusk.

(TO-DAY) THURSDAY, MAY 7TH, C. Co. FRIDAY, MAY 8TH, D. Co. MONDAY, MAY 11TH, A. Co. Supper at St. James Tavern, St. James Park Station, 7 p.m. TUESDAY, MAY 12TH, B. Co. THURSDAY, MAY 14TH, C. Co. FRIDAY, MAY 15TH, D. Co.

### OBITUARY

ROBERT KAYE GRAY.

A familiar and respected figure at the meetings for many years of the Institution of Electrical Engineers was Mr. R. Kaye Gray, who, after a long illness, passed away at the age of sixty-two on April 28th at Brighton. Mr. Gray had for many years taken a prominent part in the affairs of the Institution, and was President in 1903-4. At the time of his death he was still a Director of the India-Rubber, Gutta-Percha, and Telegraph Works Co. (Silvertown), although he resigned his position of Managing Director last year. He was actively connected with the ever-widening interests of this Company for about forty-five years, and was also on the board of several cable companies. His connection with submarine telegraphy dated from joining the staff of the late Sir Charles Bright in 1870, and among cables which he took part in the laying of was one from Gravelines to Bordeaux during the Franco-German war, several later French Government cables, the Direct Spanish cable from the Lizard to Bilbao, and a number between 1882 and 1884 to parts of central and South America. He was born in Scotland, although educated partly in London and Paris. Many will regret the loss of a man of his kindly and modest nature, who did so much by his work in connection with hospitals and charitable institutions to assist his fellow-men. Mr. Gray's remains were laid to rest at East Wickham, on Saturday afternoon last.

### GENERAL CONDITIONS

THE revised form of model general conditions recommended for use in connection with contracts for electrical works, which has engaged the attention of a special committee for some time, has now been issued by the Institution, and copies can be obtained at the price of 1s. It will be remembered that there have been negotiations between the Institution, the British Electrical and Allied Manufacturers' Association, and the Incorporated Municipal Electrical Association, and that while a considerable measure of agreement was arrived at between the Institution, the B.E.A.M.A., and the Council of the I.M.E.A., a draft of the principal agreed clauses placed before the last annual general meeting of the I.M.E.A. was not ratified. The matter is, we understand, to be discussed further at the June Convention of the I.M.E.A. In the meantime, however, the Institution has issued the code of conditions which we believe embody most of the points that were desired by the B.E.A.M.A., and it may be expected that it will shortly be adopted by the latter. The main points of discussion had reference to arbitration, consequential damages, and terms of payment. Agreement is now practically reached on these and other points, but with regard to damages for delay in completion, the limiting percentage of the contract value which may be deducted is not defined, but is left blank to be filled in, in particular cases. We understand, however, that the B.E.A.M.A. is likely to agree upon a figure for this of which its members will be recommended to press for insertion.

**Strike at the Smethwick Power House.**—The Smethwick Power House supplies not only the network of tramways belonging to the Birmingham and Midland Joint Committee, but also the consumers of the Shropshire, Worcester, and Staffordshire Electric Power Co., among whom are several large works, rolling mills, &c., and a stoppage at the power house in the daytime would have serious results. This was only averted by the prompt action of the Engineer in the following circumstances. A man who had been engaged as stoker had been transferred to a post on the engine-room repairs staff, as his work as stoker had not been considered satisfactory, and a man was taken from the boiler-house repair gang to fill the vacancy. This was resented by the other boiler-house hands, and, on Monday morning last week, all of them, comprising stokers, stokers' assistants, coal trimmers, ash wheelers, &c., handed in a notice to the effect that they intended to cease work within one hour unless the man was removed and the vacant position given to one of themselves. The notice was followed by a deputation of the men, who had, as a matter of fact, already "downed tools." The men were informed that in no circumstances could the management allow men to elect anyone to fill vacancies which may arise from time to time, whereupon the men left the premises, and the boiler house unattended, at 10.30 a.m. Fortunately, by calling on various members of the other departments of the electric supply undertaking, steam was well maintained, and efforts were at once commenced to fill the vacancies caused by the men leaving the company's service. All the vacancies have now been filled, and not one of the hands who ceased work has been re-engaged.

**The Electrical Trades' Benevolent Institution.**—We have received a complete list of the contributions received in connection with the festival dinner, and those received up to April 15th, together with a supplementary list up to April 30th. It appears that the correct total of special chairman's list of contributions which Mr. Hirst was instrumental in getting together, in connection with the dinner, is £2,463 15s. 1d. Other contributions in connection with the festival amounted to £418 15s., making a total of £2,882 9s. 1d., which is a material increase upon the amount announced by Mr. Hirst at the dinner. Other contributions received during the year, including those up to April 30th, amount to £179 8s. 2d. This liberal support will enable the invested funds of the Institution to reach £8,000. It has been pointed out, however, that no satisfaction can be felt till the invested fund reaches at least £20,000, in view of the considerable calls that are likely to be made on the Institution for pensions in the course of the next three or four years. Members of staffs of electrical firms should realise that it is a satisfactory business proposition from their own point of view to become members, and are reminded that the subscription for members is 10s. per annum, or such larger amount as each member is willing to give, and may be payable in instalments.

# ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

## THE SENGHENYDD DISASTER

THE reports of the Commissioner (Prof. Redmayne) and assessors (Messrs. Evan Williams and Robert Smillie), appointed by the Home Office to investigate the explosion at the Senghenydd Colliery, South Wales, on October 14th last, has now been issued. The inquiry was followed in our columns as to its bearing on electrical questions (see *ELECTRICAL ENGINEERING*, Feb. 5th, p. 79, and March 5th, p. 129), and it will be remembered that one of the most important questions at issue was whether the ignition of gas could have been caused by sparks from the electrical signalling system.

Prof. Redmayne describes this signalling system as follows:—

"There were a number of sets of signalling apparatus in different parts of the colliery—over a dozen in all—and each set consisted briefly of an electric bell of the trembler pattern, which though protected by a cast-iron cover was not gas-tight, a battery of anything from six to nine dry cells of the 'Dania' pattern, giving when new about 1·5 volts per cell, and two bare wires, described as No. 8 galvanised steel wires, supported on insulators, which in turn were secured to the side timbers. The wires were run 12 or 18 inches apart on the same side of the roadway. The bells and batteries were, in general, fixed in engine houses. Electric sparks, which may or may not have been capable of igniting an explosive mixture of firedamp and air (the evidence on this point will be examined later), were undoubtedly, by the very nature of the apparatus in use, of frequent occurrence. Every time the wires separated after having been brought together or bridged across by a knife or file for the purpose of giving short sharp rings of the bell, a spark or sparks would be formed at the instant of break, and every time the bell was rung there would be a rapid succession of sparks at the make and break contacts beneath the iron cover."

After a full discussion of various theories which had been advanced as to the seat and origin of the explosion, the Commissioner gives it as his conclusion that there is strong probability of the explosion having originated on the Mafeking Incline, and that it was preceded by heavy falls liberating a large volume of gas. "The only apparent means of ignition," he continued, "would be sparks from the electric signalling apparatus, or from rocks brought down from the fall, and we know that explosions have been originated by both these causes."

He then quotes general regulation No. 182, which definitely requires signalling wires and instruments, in a part of a mine where inflammable gas is likely to occur in quantity sufficient to be indicative of danger, to be arranged so that there shall be no risk of open sparking; but later in the report points out that the installation in question was exempt from the present regulations, as it had been in use before June 1st, 1911, and was in accordance with the old code of 1905, which permitted bare-wire signalling on haulage roads where the pressure did not exceed 15 volts.

With regard to the experiments which were conducted at the time of the inquiry at New Tredegar to determine under what conditions of voltage the sparks from bell circuits could ignite gas, Prof. Redmayne writes as follows:—"It was argued by counsel appearing on behalf of the owners and management, and evidence was called to show, that the sparks caused by bringing the wires together, or in the ringing of the bells, were not of sufficient intensity to ignite gas—in effect that there was no open sparking. In this connection I can only regret that the safer plan of excluding sparks altogether was not adopted. It is all the more astonishing that the management should have faced the risk that the sparks produced might have ignited gas, in view of the Bedwas Colliery explosion, which occurred on March 27th, 1912, and which was proved beyond reasonable doubt to have been caused by the sparks from an electric bell."

In a note following his main report, Prof. Redmayne gives it as his opinion that the New Tredegar experiments were not "sufficiently exhaustive and definite to warrant their being regarded as finally settling the question of the safe limit, in respect of electrical pressure and current, for electrical signalling apparatus when used in any part of a mine

which is likely to contain inflammable gas in dangerous quantity."

Further experiments were conducted by Dr. Wheeler, the results of which are given as an appendix to the report. Dr. Wheeler found that with three Dania cells giving a current (on closed circuit) of 0·45 amperes under a pressure (on open circuit) of 4·5 volts it is possible to produce a spark, by short-circuiting the current in the signal wires to give a signal, which will explode a mixture of air and methane when methane is present to the extent of 8·2 per cent.

A portion of Dr. Wheeler's curve of results is reproduced here, from which it will be seen that ignition was obtained

CURVE SUMMARISING RESULTS OF  
DR. WHEELER'S EXPERIMENTS.

with much lower voltages than was the case in the New Tredegar experiments.

Mr. R. Smillie (President of the Miners' Federation) expresses his general agreement with the Commissioner's report, but comments on one or two non-electrical matters. Mr. Evan Williams (Chairman, South Wales & Monmouth Coal Owners' Association), the other assessor, however, dissents from Prof. Redmayne's conclusions, and writes a separate report. Dealing with the signalling installation he says:—"To my mind the evidence is quite conclusive that the characteristics of the installation were such that no spark capable of igniting gas could have been produced." He is also satisfied that the position of the journeys at the top and bottom of the incline were such that no signalling could have been going on when the explosion occurred.

"Any sparking that may have taken place," he continues, "could, therefore, be produced only by the accidental contact of the two bare signalling wires. When two wires are pressed together in any way the surfaces that touch have an area many times larger than the points of contact of a knife edge across them would have, and it is a well-established fact that the current necessary to ignite gas increases in direct proportion to the area of the surfaces in contact. The further comparison must, therefore, be made as between the small area of contact of the knife edges at the Rescue Station experiments, and the larger area of the surfaces in contact of the two wires in the mine, and this strengthens my conviction that the possibility of an electrical cause of the origin of this explosion can be entirely dismissed." Mr. Williams attributes the explosion to the presence of an open light in the lamp cabin.

**The Home Office Electrical Mining Regulations.**—A new edition of the General Regulations as to the installation and use of electricity in mines, just published (Mines and Quarries, Form No. 11), contains a revised memorandum on the regulations. This is almost exactly in the same words as the previously published memorandum, except that in commenting on Regulation 129 on cables, the desirability of making the bedding between the lead and the armouring of lead-covered, armoured cables, or between two layers of armouring in double armoured leadless cables of non-inflammable material, is pointed out. Such other alterations as there are, are only of a verbal nature.

## ELECTRICAL DRIVING OF ROLLING MILLS

A PAPER by Mr. L. Rothera, on the Application of Electrical Driving to Existing Rolling Mills, was read before the Institution of Mechanical Engineers on April 24th. The author first reviewed the conditions which render conversion to electric drive desirable, and classified these under the headings of economy of running, improved drive, considerations of space, and greater use of existing plant. The question of economy depended on local conditions, and the main factor was the cost at which electrical energy could be obtained. In the case of blast-furnace or coke-oven gas driven plants this might be as low as 0.1d. per unit, and the lowest figure for outside supply was about 0.83d. It would not usually pay to put down a special steam-driven works, except where "waste" heat was available. The economy also depended on the lay-out of the works, and usually the gain in transmission losses with electric working was enormous. Again, much depended on the class of work done. Generally speaking, the greater the fluctuations in the load, the more advantageous was electric driving. It was undisputed that the uniform turning moment of the electric motor produced a better class of material than a pulsating drive, and the better grip of the material, together with the lower drop in speed on heavy load and the greater overload capacity enabled a higher average speed of working to be attained. Diagrams were given in the Paper showing the enormous saving in space that is possible by substituting electric motors for steam engines, and cases were quoted to show where increased power is required the installation of electric motors is much cheaper than larger engines and additional boiler plant. That electric rolling-mill drive could more than hold its own was shown by the fact that more than 200 mills in this country have been electrically equipped during the last six years.

With regard to the relative merits of continuous-current and three-phase working, this was partly settled by the conditions of supply, but, from the point of view of the mill motor, continuous current had advantages where variation of speed was required, and for very low mill speeds. Various methods, however, requiring the use of auxiliary apparatus, had been devised for enabling three-phase motors to perform variable-speed service economically.

The latter part of the Paper dealt with the application of the drive to the mill. Modern practice had to a great extent gone in favour of direct-coupled motors, and in very many cases even at slow speeds the extra capital cost was more than counter-balanced by the gain in efficiency. Rope driving had not as high an overall efficiency as gear drive, because the losses remained practically constant at all loads, and were not, as in gear drive, practically a fixed proportion of the power actually being transmitted. Belt drive was not much used. The form of drive to be adopted when converting a mill was largely dependent on the lay-out of the mill. From the point of view of the length of time the mill has to be shut down during the change-over, rope driving has the advantage. In some special cases, however, direct-coupled motors have been fitted with practically no shutting-down of the mill. In general, heavier flywheels are required with electric motors than with steam engines. With geared motors the flywheel should be on the mill shaft rather than on the motor shaft. A number of electrically-driven mills were illustrated in the Paper.

In the discussion, Mr. F. Anslow suggested that the author had rather underrated the powers of the steam engine, and showed some lantern slides illustrating the differences between well and badly designed electric drives. Dr. B. Wiesengrund also showed a number of slides of electrically driven mills, and his remarks were principally in defence of gear driving. Mr. A. Holman spoke of some pioneering experiences in electric mill driving in India, and referred to the advantage which electric working had, of the possibility of determining the power being transmitted at any instant, which had often enabled him to localise troubles. Capt. C. H. Willis also related some experiences in converting old mills to electric drive, and Mr. Monks spoke of very satisfactory results after conversion of two mills from steam to electric drive in respect of decreased power consumption, increased output, and improved quality of work. Mr. H. Brown referred to the necessity for a rapid drop in motor speed, with the load if the energy storage of the flywheel was to be taken advantage of, and mentioned a new automatic contactor type of slip regulator for the purpose. With regard to gearing, he spoke of successful examples of mills driven through worm gear. Mr. A. H. Hall said that one of the most useful points in connection with electrical driving was that it enabled one to tell much more simply than by tensile tests, because at a certain point the power curve went up suddenly, and indicated almost exactly when annealing should

be started. He also raised several practical points of detail. Mr. H. H. Thorne also spoke, and Mr. Rothera replied to the discussion.

## A REPAIR TO A MINING CABLE

IN the course of a Paper on repairs to electrical plant, by Mr. F. Smith (Pinxton Collieries), read before the Midland branch of the Association of Mining Electrical Engineers, an account was given of a method adopted to repair a 19/16 three-core vulcanised bitumen insulated 1,100-volt shaft cable which was damaged by a falling piece of coal. The blow was so severe that it broke some of the armouring wire and started a short between two of the cores. One core was entirely burnt through and the other core was partly burnt. Fig. 1 shows how the repair was made. An iron tube 3 in. in diameter and 2 ft. 6 in. long was cut in halves longitudinally, then two india-rubber bungs were prepared to fill in the spaces between the tube and the bitumen sheathing. The armouring was cut through and laid back for several feet, and the bitumen sheathing stripped off for a distance of about a foot. The core that had been entirely burnt through was

SECTION OF REPAIRED CABLE.

then connected by two cable connectors and a piece of make-up wire. The second core, which was only partially burnt through, was reinforced by a cable connector. Each of these repairs was then taped with pure rubber and vulcanised rubber, and then three distance rings of black adhesive tape were wound on to give an outside diameter of 2½ in. After the two halves of the tube were placed in position, a mixture of bitumen and switch-oil was poured into the space between the cable and the tube until it was quite filled in with the mixture. After it had set, the top india-rubber bung was put in, and then the armouring was brought over the two ends of the tube and clamped down. The insulation resistances of the cable were as follows:—Testing pressure, 1,000 volts; before the breakdown, 45 megohms; one hour after the repair, 0.2 megohms; six days after the repair, 5 megohms; 13 days after the repair, 25 megohms. The armour conductivity is the same as when the cable was first installed.

**The Association of Mining Electrical Engineers.**—At the annual dinner of the Notts and Derby Branch of the Association of Mining Electrical Engineers, Mr. W. Maurice, in speaking of the important work done by the Association, said that it was the only electrical body of its kind recognised by the Mines Department of the Government, and that it was practically due to it that mining electrical engineers were officials under the Coal Mines Act.

**A Home Office Prosecution.**—At Durham last week the Coal Distillation Co. were prosecuted under the Factory Acts for leaving certain live conductors exposed at the by-product ovens at Littleburn Colliery. A workman named Blackburn came in contact with them, and had received a fatal shock. A fine of £10 and costs was imposed.

**Mining Fatality.**—A somewhat curious accident occurred at the Blaenavon Pit recently. It appears that an electric cable had burnt out and set fire to two rotten timbers which had been replaced but not removed, and a man was suffocated by the smoke.

## ELECTRIC SAFETY LAMPS FOR MINES

AN order has been issued by the Home Office approving several types of safety lamps for use in mines, in addition to those of which approval has already been signified (see ELECTRICAL ENGINEERING, Vol. IX., p. 817, June 5th, and p. 555, October 18th, 1913).

This order, which is dated March 16th, approves six patterns of electric lamps for general use, and four lamps for use by officials or for special purposes. The ordinary lamps are the following:—

The "B.A.C." LAMP, made by the British Accumulator Co., Ltd. (35 King Street, London). This has a stamped steel case and cover, and an internal fibre terminal plate carrying the

FIG. 1.—B.A.C. LAMP. FIG. 2.—TURQUAND KINGSWAY LAMP. FIG. 3.—JOEL-FORS LAMP.

contacts, bulb, and reflector. The outer glass is protected by a steel crown on four steel pillars, and is made gas-tight by a rubber ring. A magnetic lock is fitted. The total weight is 5½ lb., and, as in the case of all the ordinary lamps, it is specified to give 1 c.p. all round in a horizontal plane for nine hours, and 1½ c.p. over an arc of 45° in a horizontal plane. (See Fig. 1.)

The "TURQUAND-KINGSWAY" LAMP, made by the General Electric Co. (67 Queen Victoria Street, E.C.). This is shown in Fig. 2, and has a case of steel, aluminium, or aluminium alloy, and the cover of similar material makes a flame-tight connection with the case by an indiarubber washer, and is secured to the case by a T-section steel stud engaging a slot in the cover lined with a steel bearing plate, the lock and two dowels entering holes in the cover. The brass switch plate forms a flame-tight

FIG. 4.—THOMSON-ROTHWELL LAMP. FIG. 5.—VARTA LAMP. FIG. 6.—WOLF LAMP.

connection with the cover, and engages a hollow screw lamp-holder carrying an insulated contact. This plate carries the protecting glass, which is held in position by a lip, and forms a flame-tight joint with the brass plate by means of an indiarubber washer. The glass is supported at the top of a metal crown by four pillars. Two alternative forms of lead lock are described, and the weight is given as 5½ lb. (See Fig. 2.)

The "JOEL-FORS" LAMP, TYPE 403M, made by J. Mills & Sons (Walkergate Brass Works, Newcastle-on-Tyne). This has

a case of cast aluminium alloy, and a flame-tight cover of the same material, secured by a bayonet joint and a riveted hasp and staple, and locked by a lead rivet or magnetic lock. A screwed castellated ring holds the cylindrical protecting glass in position between the cover and a cast aluminium alloy crown supported by four steel pillars; the joints are made flame-tight by asbestos or rubber washers; the detachable bulb-holder is secured by a spring clip. The flame-tight screw switch in the cover can only be brought into operation when the cover is in the closed position. The weight is given as 4½ lb. (See Fig. 3.)

The "THOMSON-ROTHWELL" LAMP, made by J. H. Rothwell & Co. (Sindley, Swinton) and the Thomson Co. (Marlborough Place, Oxford Road, Manchester). The case of this lamp is of steel, brass, or aluminium, with a flanged brass locking ring, and a cover consists of a middle base ring of brass or steel carrying an aluminium or steel crown supported by brass or steel pillars. The middle base ring is threaded internally to take a brass glass-retaining plate. A stout protecting glass forms flame-tight connections with the crown and retaining plate by washer of asbestos or other material. The glass-retaining plate also carries the lamp-holder and an insulated electrical contact piece. Either a lead or magnetic lock is fitted. The weight is given as 5 lb. 4 oz. (See Fig. 4.)

The "VARTA" LAMP, submitted by the Tudor Accumulator Co. This is shown in Fig. 5, and has a cylindrical stamped sheet steel seamless case, galvanised or enamelled outside, and a stamped steel top which is secured to the case by a bayonet flame-tight joint, and locked by a magnetic lock. A disc of insulating material within the lamp top carries the bulb, reflector, and switch contacts, and is secured to the cover by a screw ring which bears on a flange on the disc. A stout protecting well-glass forming a flame-tight connection with the

FIG. 7.—JOEL-FORS INSPECTION LAMP. FIG. 8.—JOEL-FORS HAND LAMP. FIG. 9.—VARTA OFFICIALS' LAMP.

lamp top by a washer of indiarubber or other suitable material. The well-glass is protected by a sheet steel crown supported by five steel pillars. The accumulators are fitted with sliding spring terminals. The weight is given as 6½ lb.

The "WOLF" LAMP, No. 2, of the Wolf Safety Lamp Co. (Bank Street, Sheffield). This is a modification of the Wolf alkaline and lead lamps already approved, except for details of construction of the case and locking arrangements. (See Fig. 6.)

The following lamps are approved by the order for use for work of exploration or rescue, or by officials:—

The "JOEL-FORS" INSPECTION LAMP, TYPE 303C, made by J. Mills & Sons (Walkergate, Newcastle). This lamp is of the bull's-eye pattern, with sheet iron case. It weighs only 2½ lb. A screw switch is fitted at the top of the case.

The "JOEL-FORS" ELECTRIC HAND LAMP, TYPE 403H, is a heavier pattern of bull's-eye lamp, with a cast aluminium alloy case, by the same makers. It weighs 4½ lb.

The "VARTA" ELECTRIC SAFETY LAMP, TYPE 2 Et 4, submitted by the Tudor Accumulator Co., is also a lamp with the lantern at the side, covered by an ordinary protecting glass. It is for the same c.p. as above, and weighs 7½ lb.

The "WOLF" RESCUE LAMP, No. 2, made by the Wolf Safety Lamp Co., is a modification of the Wolf Lamp, No. 2, referred to above, with which it is identical, except that the bulb and reflector are contained in a hooded shield, furnished with a stout protecting glass held in position by a screw ring locked by a screw inserted from the inside of the cover. Its weight is 5½ lb.

All the above special lamps are designed to give not less than 1½ c.p. for nine hours. The first three are illustrated in Fig. 7.

**The South Wales Miners' Federation.**—At the annual Congress last month at Cardiff, there was a long discussion on a report on the use of electricity in mines, in which Mr. T. Richards, M.P., urged the dangers that might be present. Ultimately, an extreme view of the risks involved prevailed, and a resolution was adopted asking the Labour Members in Parliament to endeavour to secure the prohibition of the use of electricity for motive power in fiery mines.

### MINING SWITCHGEAR

FOR the control of electrical plant in fiery mines the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), are introducing a range of switchgear which embodies a number of improvements. Included in this range are a number of explosion-proof circuit-breakers, one of which is illustrated in Fig. 1. The circuit-breaker is contained in a strong cast-iron case provided with long, well-machined flanges, which give a good metal-to-metal joint, and are effective in

FIG. 1.—FLAME-PROOF MINING CIRCUIT-BREAKER.

cooling the products of an explosion in the interior of the box to a temperature well below the minimum ignition point of the most explosive atmosphere that is possible. In addition, the internal construction is such that an explosion can bring about no derangement of the gear. Efficient arcing shields are provided which prevent the arc reaching the metal case, which, nevertheless, is thoroughly protected with fire-proof insulating material. The lid, which is strongly hinged, is provided with a patented interlock which precludes any possibility of the circuit-breaker being opened when the lid is open, and so causing an ignition of the gas. The lid can only be opened when the circuit-breaker is in the "off" position, and when the lid is open the circuit-breaker cannot

be closed. Such are the internal arrangements that when the lid is open it would be a matter of difficulty for anyone to touch a live part accidentally. Another important feature is the flame-proof construction of the glands which are supplied to take various kinds of cable into the boxes.

A further new piece of mining apparatus made by the Company is the 5-ampere double-pole iron-clad explosion-proof switch with fuse shown in Fig. 2. One of the features that should be noticed is the shape which has been given to the case to reduce to a minimum the unoccupied space in the interior, while leaving adequate clearance between the live parts and

FIG. 2.—FLAME-PROOF ENCLOSED D.P. SWITCH AND FUSES.

the frame. The switch consists essentially of a pair of tumbler switches actuated by a handle passing through the side of the box, and connected to a substantial *lignum vita* coupling bar. The "on" and "off" positions of the switch are decisive and clearly marked. The designer has been aided in his work of reducing the dimensions of the box by the use of the "Rex" replacement fuse, which, while being of small proportions, has behaved excellently in the short-circuit

tests that have been applied to it. The metal of which the case is formed is  $\frac{3}{16}$  in. thick throughout, the cover is hinged and secured with hexagon nuts, and is interlocked with the switch movement in such a manner as to prevent the switch being operated when the cover is open. The machined flanges of the box and cover are 1 in. wide, and every care has been taken to eliminate possible points of exit for the products of the explosion. Where holes have had to be drilled in the case, as, for instance, to accommodate the pins about which the *lignum vita* coupling bar moves, the hole is plugged by a screw which is tightly fixed in position. The point of entrance of the spindle connecting the handle to the *lignum vita* batten is provided with a long bush; it is a very close fit, and in addition it is packed by means of a gland.

### ELECTRICAL WORKING IN COLLIERIES

IN a Paper read before a meeting of the Association of Mining Electrical Engineers, Mr. J. A. Kerr stated that it was often advantageous for colliery proprietors to install their own generating plant, owing to the cheapness of coal and the small amount of attention required. He also recommends the use of D.C. machines for pressures up to 400 volts. The greater immunity from breakdown at present enjoyed by A.C. motors is due to the fact that the manufacturers of the latter have usually expert knowledge of mining requirements, whereas much of the D.C. plant installed is only fit for factory use. When the motors are situated at some distance from the source of supply, however, three-phase high-tension machines are preferable. As regards the cables used for transmission, although the system of armouring and earthing is quite satisfactory when properly carried out and carefully maintained, in many cases better results can be achieved by making the insulation proof against the need for these devices, and working at a rather lower pressure. Generally speaking, it is safer on small installations not to resort to earthing unless it is possible to get a dangerous potential difference between each machine and earth. A difficulty met with on earthed systems is the scarcity of men who are competent to keep the earthing in a satisfactory state. There is also more labour required to shift the machines from one section of the mine to another, when this system is used. A case was mentioned where a three-core 0.25 sq. in. double-wire armoured bitumen cable developed a fault owing to the unequal expansion and contraction of the copper cores and the iron armouring, which caused the former to be decentralised. The method of locating a fault in bitumen cables by burning out is not recommended, as the current may be sufficient to decentralise the cores, a better method being to measure the drop along the armour with a low reading instrument. This method also has the advantage that the fault can be located to an inch. Trouble is sometimes experienced with the larger motors used, owing to the use of presspahn as an insulator for the windings. In a humid atmosphere the resistance of this material sometimes decreases sufficiently to cause short-circuits. Loose foundations and consequent vibrations are sometimes accountable for chafing between adjacent wires in the stators of high-speed motors. This eventually wears away the insulation and causes trouble. The remedies are, good foundations and securely anchored coils. Box-type brush holders are preferable to those of the hammer type, both for commutators and slip-rings. The practice of throwing dry graphite on rawhide pinions is deprecated on account of the tendency of the graphite to drift into the windings and cause trouble. With coal-cutting machines, care must be exercised that the oil which finds its way to the bearings is free from grit and suspended metal dust. A point worth remembering, also, is that the picks should be kept of equal length, and sharpened so that the points and not the edges do the cutting. Wherever oil-switches are used, the cables should not be led into the oil chamber, or the oil will tend to syphon out and damage the insulation. To cope with the difficulty sometimes experienced in the selection of reliable switchgear, the author suggests the formation of an "Inspection Committee," composed of members of the Association. A suggestion is also put forward that in place of the usual works tests, the manufacturer should be called upon to guarantee his plant when tested after it has been in actual operation for a certain period. In conclusion, the author mentions several points which he considers should be noted wherever electricity is used in collieries. A system of file cards giving full particulars of each motor and its accessories is recommended. Small motors in naked-light pits, when situated in the return

## FAULTS IN ELECTRIC CABLES

Use Raphael's portable direct-reading fault localiser (which gives the result in yards without calculation), and a Nalder portable moving-coil galvanometer.

airway, should always be totally enclosed. Care must be taken that the men perform their respective duties adequately and regularly. Standardisation of machines, motors, and switchgear is highly desirable, and, in short, the persons responsible for the electrical side of the colliery should endeavour to attain reliability, efficiency, and economy.

### FAULT TESTING IN MINES

**M**R. E. E. BEADSMOORE, of the Notts and Derbyshire branch of the Association of Mining Electrical Engineers, has been reading an interesting Paper on "Fault Testing." In it he advocates no new methods or principles, and he has obtained good results on the application of both the loop and fall of potential methods of localising faults, using suitable apparatus, but he insists that the colliery electrician must have such instruments as a milli-ammeter and a milli-voltmeter, in addition to the usual switchboard instruments and the "megger." He has to be able, under the regulations, to locate faults as well as to find their existence. Among the examples given of actual faults located was one in which the resistance of the fault was 43,000 ohms; a loop test was used, and, in order to get enough current through the fault to obtain readings, a 500-volt megger was employed in place of a battery. The only other apparatus used in this last test was a sensitive low-resistance milli-ammeter and 25 ft. (300 in.) of resistance wire. This was connected between the two ends of the cable, as was also the milli-ammeter. One terminal of the megger was connected to earth, and the other to a wire which was moved along the resistance wire, to find the point at which no reading could be obtained on the milli-ammeter. This was found to be between 87 and 90 in. from one end (average, 88½ in.), so that test indicated the fault to be  $\frac{88}{100} \times 88\frac{1}{2} = 177$  yds. from the corresponding end of the cable loop. Actually there were found to be two faults a few yards away from the points indicated.

### MINING ELECTRICAL EQUIPMENT

**I**N the course of a Paper entitled "Electrical Equipment for Low Energy Consumption," read at the South Wales and other branches of the Association of Mining Electrical Engineers, Mr. J. Glynn Williams referred to a number of practical points in connection with mining electrical equipment. He spoke of good experience with Curtis high-pressure turbines, and, passing on to cables, expressed a preference for paper-insulated lead-covered double-steel-tape armoured cable on account of its better behaviour on short-circuit than bitumen insulated cable. A number of practical points on switchgear, motors, and controllers were recapitulated, and it was particularly insisted upon that stator reversing switches should be interlocked with controlling panel switches. For lighting he advised a 220-volt circuit with 40-watt drawn-wire lamps and conductors in ½-in. screwed conduit tubing. For underground lighting on main roads bulkhead fittings fixed in the centre of the roadway roof make a good job. The tubing should be run along the side of the road, and branches taken to a bulkhead fitting with a three-way junction box having a porcelain interior. This does away with joints, and saves cables. All fittings should be locked to prevent unauthorised persons tampering with the lamps. For such cases as inbye motor houses, lighting by portable alkaline accumulator lamps of 21 c.p. is suggested, taken in and out at the beginning and end of each shift.

At the end of the Paper some figures of energy consumption were given for a colliery with an output of 5,120 tons per week, where electricity is the sole motive power, generated from high-pressure turbo-alternators. The energy consumed per week is allocated as follows:—

	Total units for week.	Units per ton output.
Ventilation ... ..	20,160	3.94
Pumping ... ..	1,266	0.247
All surface and underground lighting, lamp-cabin motors for cleaning and charging accumulators ...	456	0.089
Screening ... ..	2,357	0.46
Haulage ... ..	6,042	1.18
Winding ... ..	6,548	1.279
	<u>36,829</u>	<u>7.195</u>

The units per ton mile for electric haulage and winding work out at 1.92. The author puts the lowest cost at which a colliery generating station could be run at 0.25d. per unit.

## A SIGNALLING SYSTEM FOR MINES

IN view of the coming into force on July 1st next of the Home Office order requiring all winding engines to be provided with visible signals, indicating the nature of the signal till it has been complied with, the following details of a system of mine signalling which has been brought out by the British Electrical & Manufacturing Co. (Athenaeum Street, Sunderland) may be of interest.

An outstanding feature of the system is simplicity of operation. All the signals are transmitted from one Morse key push, and an interlocking system insures that only one man can signal at a time to the engine-house.

The equipment in the engine-house consists of an indicator

FIG. 1.—GENERAL ARRANGEMENT OF SYSTEM.

board, giving luminous signals showing from which seam the signal is transmitted, and showing whether coal is being worked or men riding, and containing a luminous signal controlled by the banksman, and revolving signal indications giving actual winding signal in accordance with number of rings. There is also one single-stroke pit-bell, one single-stroke bell of distinctive tone from the banksman, an emergency alarm trembler bell, a resetting switch worked by hand, foot, or automatically from the engine, a signalling push to the bank, and a "down-rapping" push enabling the engine-man to signal to the seam transmitting a signal to him. Interlocking relays are also provided, one for each seam circuit, and one isolating relay. The bank installation comprises a single-stroke pit-bell; a distinctive tone (single-stroke) engine-house signal-bell; selective down-rappers, one

for each seam; a change-over indicating switch (coal-work and men-on); an emergency alarm push, and a signalling push to the engine-house. Each seam is equipped with a Morse key signalling push, a single-stroke bell, and an emergency alarm push.

Fig. 1 shows the general arrangement, and Figs. 2 and 3 show the relays. Upon the on-setter in any seam signalling, say, four raps, viz., lower cage to low main, the first stroke on his push rings his own signal bell, and energises the left-hand coil (Fig. 2) upon the corresponding relay, and rings

FIG. 2.—INTERLOCKING RELAY.

the pit signal bell. The relay closes the left-hand contacts and opens the right-hand contact.

The two right-hand contacts control circuits which respectively illuminate the seam indicator lamps and energise the left-hand coil on the isolating relay, thus opening all the other push circuits in the pit, leaving the on-setter signalling only in circuit with engine-house indicator, until the relays are replaced and the indicator cleared by the engine-house replacement key. The signal indicator consists of a light drum with mounted transparent linen signals painted thereon, the indicator moving with every stroke of the bell. A lamp is placed inside the cylinder. The bankman's pit signal bell is connected in parallel with that of engine-house, the bankman hearing all signals transmitted to the engine-house. The engine-man's indicator, upon receipt of the signal, would read "Coal work low main," and on moving indicator "Lower cage low main," four strokes sounding on both bank and engine-house pit signal bell. The engine-man, upon carrying out the signal, will immediately reset the apparatus by energising the right-hand coils of the relays. Any other on-setter attempting to signal fails to ring his own bell, thus knowing that he is cut out of circuit. In the event of the on-setter giving three rings, viz., "Men to ride," the same cycle of operations takes place, and the banksman will immediately

Fig. 3.

change over his switch, changing standing ("Coal-work") signal to that of "Men riding," which remains standing until returning to ordinary winding. He also signals to the engine-house on the push provided that he is clear, his signal being visually indicated, and also to the on-setter, ringing his bell, that he is ready; and the engine-man also signals to the bank on his push that he is ready; winding then proceeds in the usual way. The emergency alarm circuit is not interlocked,

all pushes being in parallel throughout, thus enabling any man to hold the cage in the event of any accident or emergency. The special down-rapping push enables the engineman to reply to any on-setter who has signalled to him through the medium of the closed interlocking relay. The cable required for this installation has four cores from the shaft bottom, and an additional one from each seam travelling upwards. The system can be designed to work with any voltage.

## ELECTRICAL MINING AND METALLURGICAL PATENTS OF APRIL

THE following specifications of interest to mining engineers have been published during the last month:—No. 14,427, of 1913, Fried. Krupp Aktiengesellschaft Grusonwerke, of Magdeburg-Buckau, Germany, describes a magnetic separator in which adjustment of the field strength is attained by the use of tapered poles, in conjunction with rotating disc armatures, which can be adjusted axially so as to alter the magnetic air-gap. Another patent relating to this subject is No. 9,725, of 1913, by H. H. Thompson, of Aldridge, Staffs., in which the armature is of the rotating drum-type, and is constructed of circular discs. Two sizes of discs are used in alternate order, so that the edges of the larger diameter discs project and form magnetic edges. This separator is particularly adapted for the separation of feebly magnetic material. F. Faerber, of Dortmund, Germany, describes in specification No. 16,467, of 1913, a combined miners' safety lamp and fire-damp detector. The latter is located inside the accumulator, which is made annular-shaped and is provided with slits, so that the detector, though visible, is protected from injury. Specification No. 9,321, of 1913, by A. Paxton, of Cardiff, relates to an improved form of safety lamp lighter. The lamp to be lighted is enclosed in a metal case, and a system of interlocking ensures that no ignition can take place until the lamp-case has been properly closed. A system is described in specification No. 25,975, of 1913, by J. H. Reineke, of Bochum, Germany, whereby it is possible to utilise the rails and pipes in mines for signalling purposes. Use is made of the fact that the galleries, though usually damp, are cut through dry rock, which is almost an insulator. A battery and microphone are used for transmitting, the rails are used as line wires, and the damp earth as return. The telephone receivers are of the ordinary type. A novel type of gong, giving a clear, unmuffled ring, forms the subject of specification No. 7,638, of 1913, by F. F. Macdonald, of Dinnington.

The following specifications, also published during April, will be of interest to metallurgists:—No. 6,161, of 1913, in which T. J. Craig and P. Spence & Sons, Ltd., of Manchester, describe a method of obtaining very finely-divided copper by electrolysis. The method is to employ a reducing agent in the electrolyte, so that as soon as the copper, which forms the anode, is brought into solution, it is precipitated as a fine powder by the reducing agent; this oxidised reducing agent is then moved to the cathode (which may be of lead) by stirring, and is there de-oxidised and rendered ready to assist in further precipitation. Ore-smelting by the use of induced eddy currents has hitherto been difficult of application, owing to the fact that these currents tend to confine themselves to the outer surfaces of the smelting bath. In specification No. 23,004, of 1913, S. Guggenheim, of Berlin, claims to have overcome this difficulty by arranging the bath between two or more pairs of magnet poles, so that several eddy current centres are formed which exert mutual influence and prevent the lines of force from being confined to the surface. It will, of course, be understood that alternating current is used to excite the magnets in question. Fried. Krupp Aktiengesellschaft, of Essen, give particulars, in specification No. 5,414, of 1914, of a curb-ring for the electrodes of electric furnaces. The electrode holder is arranged so that it can be adjusted horizontally and vertically, thus necessitating very little clearance between the curb-ring and the electrode.

"Wireless" Telephones in Mines.—Experiments are being made at the Lindsay Colliery of the Fife Coal Co. at Kelly with the Reinecke induction telephone which has been referred to in *ELECTRICAL ENGINEERING*, Vol. IX., page 555 (October 2nd, 1913), and Vol. VIII., "Mining Supplement," page lxxiv. Similar installations have been tried at Dinnington Colliery, near Rotherham, and the Astley Green Colliery of the Clifton & Kersley Coal Co.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,390.

What is the "heating time-constant" of a transformer? How can it be calculated from the design? Is it affected by alterations of load or the method of cooling?—J. H. B.  
(Replies must be received not later than first post, Thursday, May 14th.)

### ANSWERS TO No. 1,388.

An earth indicator is connected up as in Fig. 1 on a three-phase star-connected system supplied through a transformer as

FIG. 1.

shown. What is the mistake? How ought the instrument to be connected? Explain its uses and action.—SPARK.

The first award (10s.) is made to "W. R." for the following reply:—

It is obvious, with an earth indicator connected up as shown in Fig. 1, that even if there is no defect in the insulation of the system, we shall get an earth indication due to the neutral point of the transformer being grounded.

The usual method of connection when the neutral is earthed is to connect an ammeter, as shown in Fig. 2; it will be seen that any leakage current will then be indicated on the ammeter.

Earth indicators are used in mining installations under

FIG. 2.

FIG. 3.

circumstances covered by the following extract from the Home Office Rules:—"Efficient means shall be provided for indicating any defect in the insulation of a system."

**"Prana" Lattice Armouring**  
in steel, copper, brass or phosphor-bronze.

- For the protection of Rubber Hose, Flexible Tubing, Cables, &c., &c.
- Neat in appearance, extremely flexible, rust-resisting. Low cost.
- Especially adapted to the protection of "Sud" connections.

**"Prana" Die Castings**  
are ready for assembling.

- The dies in which they are cast are virtually a gauge, so that further examination is unnecessary.
- They cannot vary.
- Made from alloys of guaranteed soundness.
- British owned and made—"Tough and True."

Let us send you particulars and samples.

**"PRANA" DIE CASTINGS.**

**AERATORS LTD. (DEPT. E.E.) UPPER EDMONTON, LONDON, N.**

The action of the instrument is as follows:—A milli-ammeter is used as the indicator in conjunction with a plug switch and three resistances (see Fig. 3) which are so proportioned that in the case of a bad fault giving full line voltage to earth the instrument would indicate the maximum reading on the scale. Under normal working conditions all three keys are in the plug, so that the earth indicator is kept in circuit permanently. If a fault occurs on one of the mains, a deflection is obtained on the milli-ammeter, and to determine on which phase the fault exists the three plug keys are taken out and tried one at a time, the faulty phase giving the smallest deflection.

The second award (5s.) is made to "G. C.," whose reply we give below in slightly abridged form:—

The diagram of an earth indicator, as shown by "Spark," is correct for a three-phase system where the neutral point is insulated, but as the neutral point is shown earthed the arrangement does not hold good. If one of the switches were to be closed it is equal to putting a load on the particular phase, as a circuit is at once made between one phase and neutral through  $R$ , and the readings on the milli-ammeter would be of no account.

A simple diagram would be as shown in Fig. 4, the resistance  $R$  being to protect the instrument in the event of a bad "earth." A more complex diagram is shown in Fig. 5, the principles of which are similar to Fig. 4, but a short-circuiting switch and an alarm bell are added. When the

FIG. 4.

FIG. 5.

leakage current reaches beyond the range of the instrument the solenoid of the switch is attracted and automatically short-circuits the instrument, and also rings the alarm bell to warn the attendant of the presence of an earth. On large systems it is always advisable to switch in a limiting resistance to prevent putting a dead short across the phase in the event of a serious earth. This resistance is shown dotted in diagram Fig. 5. In both diagrams Fig. 4 and 5 the method does not discriminate the particular phase which is faulty, and one way of overcoming this is to put a switch in the neutral wire and open this switch when testing. The system can then for a time be considered as an insulated system, and the diagram as shown by "Spark" could be applied.

**The Institution Council Election.**—Balloting papers were issued last Friday, with the fortnightly "Journal," and have to be sent in to the Institution by to-morrow. In addition to the names published in our last issue, Mr. H. T. Harrison has been proposed by the following members: O. M. Andrews, A. W. Beuttell, A. W. Blake, W. A. Brown, T. Kerr-Jones, F. Pooley, N. W. Prangnell, C. N. Russell, A. H. Shaw, and E. Slater.

## THE "POINT FIVES"

A MEETING of the "Point Fives" was held at the B. & K. Restaurant, Earl's Court Road, S.W., on April 17th. Mr. Shaw (Worcester) and Mr. Furness (Blackpool) were elected members. It was announced that the next meeting was to be held during the M.E.A. week, on Thursday, June 18th. A supper will be held at the Grand Hotel, Birmingham, at 10 p.m., and the meeting will be held afterwards. The electric cooking works, testing rooms, laboratory and museum of the B. & K. Accessories Co. were visited, and an excellent electrically cooked dinner was partaken of.
